The Independent
A Weekly Magazine
Founded in 1848
January 2, 1913

VOLUME LXXIV NUMBER 3344

Our New Dress

We start in the new year under the new management with a brand new dress and a nice new set of good resolutions. Naturally we want to brag a bit about them, now while the dress is still unworn, and before the resolutions have fallen by the way and been ground into the pavement. The type we have adopted for the body of the magazine is of larger, clearer face than formerly and those of our subscribers who have been reading THE INDEPENDENT for 65 years—we have several such on our list—will doubtless regard the change as made for their especial benefit, but we hope also that our younger and more recent friends will find the new typography more attractive than the old. At the same time by putting the shorter articles in smaller type, tho not smaller than that used for the main part of some of our most highly esteemed contemporaries, we have virtually enlarged the magazine.

Some minor improvements may also be noted; for example, each leaf bears the name of THE INDEPENDENT, the title of the article and the date of the issue. We have several times received letters from our subscribers asking for such identification marks to aid them in filing their clippings. Few magazines are so apt to be torn up after reading as THE INDEPENDENT, sometimes no doubt in anger at some obnoxious expression of opinion, but more often because some article is thought worth preserving and putting where it will be handy. We don't mind that. If we are found more useful in pieces than intact, so be it. We aim to give every week at least one thoro and authoritative article, often of considerable length, the *pièce de resistance* of the meal so to speak; such an article for example as the analysis of the operation of the stock exchange in last week's issue or Professor Fisher's novel monetary proposal in this. These articles may be and we hope will be skipped by all who have no interest in either stocks or money for among the fifty or more other topics treated in the same issue they will surely find something worth while to them.

In order to secure a greater variety and to touch life at more points we are making a change in the form of our old department, "The Survey of the World," tho we retain the name because we hope to justify it more fully than in the past.

A mere chronicle of the conspicuous events of the week in such a condensed form and without comment is more suited for reference than reading and it has become less necessary in recent years when all country papers have a good news service and the rural free delivery has brought

the daily to the door of the farmhouse.

At the same time our old "Survey" like the newspapers has been chiefly confined to political happenings which after all are not the whole of life, and often indeed are comparatively unimportant. The new "Survey" will aim to include a wider range of topics, scientific discoveries, new inventions, feats of engineering, industrial achievements, works of art, advances in agriculture, religious movements, improved methods in household and municipal economics; in short, whatever may serve to illustrate the course of human progress here and abroad. To carry out our plan to make this department varied and vital the coöperation of a large number of contributors will be required and we appeal to our readers to assist us either by articles or by the suggestion of topics which they would like to hear about. Contributions should be from one hundred to three hundred words in length and if accompanied by a good photograph or sketch the chances of acceptance are much increased. Illustrations will be used in THE INDEPENDENT more frequently than formerly, *illustrations*, we say, for we shall try in the future as in the past to resist the temptation to fill up our pages with mere pictures which have nothing to say and nothing to do.

The editorials which have always been the leading feature of THE INDEPENDENT will now be made leading in the literal sense. Doubtless here the reader will find some things he does not agree with; at least we hope so, otherwise we should feel that we were wasting our ink. THE INDEPENDENT was founded to espouse the most unpopular reform of the day and it has continued the custom. As soon as one of our pet heresies has become accepted and established we adopt some other poor but worthy cause and try to give it a start in life. This is not the way to get rich but it is lots of fun.

The Industrial Commission Appointments

Mr. Taft, or his Secretary of Commerce and Labor, has missed an opportunity. It was an exceptionally big opportunity this time, and the failure to use it is not easily comprehensible.

The proposition to create an Industrial Commission was put before Mr. Taft by men who have studied forces and tendencies in the industrial world as experts. It was not a suggestion to patch up a peace between employers and wage-earners, or to head off radical legislation, or to make the half-informed voter believe that the federal government would "do something" to set right the economic maladjustments of which the average citizen complains. It was a product of the serious thinking of men who have been asking why it is that discontent is increasing in a land of abundant resources and in a time of prosperity. It was backed up by exact statements of facts and conditions. It made upon Mr. Taft himself so great an impression that he became seriously interested in it, and undertook, so far as his own authority and power permitted, to put it into realization. What then happened to him, what influences got his ear, we do not pretend to know. But anything more inadequate and disappointing than the commission that he has appointed it would not be easy to imagine.

It must be admitted that the President was limited by law in his selections. Three of the nine members had to be employers of labor, three representatives of federated labor, and the three others he could choose as he pleased. His hands were tied as to the six, and we doubt not that, for the purpose and field required, they are fair experts. It is the three who were to represent the people, who were to be in a measure arbiters, to whom we ought to look for the most careful and scientific expert study of the subject. They should be the strongest,

most valuable members, proved by long study and knowledge able to direct the investigation.

Now what have we? A Senator from Utah, a member of the Connecticut legislature, and a Georgian farmer—all good men, but not one of them anything more than a superficial student of the problems of industry. They have had some interest in the subject, but they have had no occasion to study its intricacies. They will have much to learn before in 1915 they bring in their final report.

We confess to a real disappointment. The subject is one of tremendous importance, one that has elements of most serious danger to the security, if not the existence, of our government, as the developments at the Indianapolis trial prove. We need speedy wisdom as to policy and legislation. We will yet hope more from this commission than we have the right to expect.

The Dynamiters Convicted

The trial of the most extraordinary conspiracy of destruction and murder in the history of the country has come to a successful conclusion this last week in Indianapolis. After three months given to the testimony thirty-eight men, all but three officials of the International Association of Bridge and Structural Iron Workers, have been convicted of conspiracy to carry dynamite and nitroglycerine illegally on interstate railways. That is the designation of the crime for which they could be tried by federal law; but it was made perfectly clear that the explosives were sent for no innocent purpose, but for the purpose of blowing up bridges and buildings, and that they had devised and paid for a multitude of such acts of violence.

What was the object of President Ryan and the other thirty-seven men in ordering these 105 explosions in the last six years, which culminated in the destruction of the *Times* building in Los Angeles with the loss of over twenty lives? It was simply to compel the contractors to use only union labor, to force them to employ only union members, and shut out everyone else. They would have no open shop. For this selfish purpose they made war against men not members, and those who employed them, and against organized society and the laws ordained by the people. They were bandits of the worst sort, now convicted as such, and as such will go to prison for a term of years.

This will clear the industrial atmosphere amazingly. It is proved that men thus guilty can be punished. After the acquittal at Cœur d'Alene of Hayward and others it was feared that such crimes could not be punished, but the confession of the McNamara brothers in Los Angeles, and now the conviction of the highest officers of this International Association, give us hope and faith that the poison which permeated that body will not infect other great bodies of workmen. The hidden criminality has been brought to light, and will be generally condemned except by organizations of confessed syndicalists and anarchists. The line is being drawn and must be drawn closer. Our workmen as a whole are not assassins.

A Monument to General Booth

The Salvation Army is engaged in the effort to erect as a monument to General Booth a model building in this city which shall serve as its headquarters. The Army is poor, has no large architectural ambition, but it has a big heart, and its aims are the noblest. If its pennies can collect one or two hundred thousand dollars it will be elated, but it deserves as much as would build a dreadnaught.

William Booth gave sanctity to the military title which he assumed. He founded an army, and not an army created for destruction and death. He was a General, commanding no bayonets or cannon. He was a poor Methodist minister, and the Methodists rejected him because he did not follow their way of saving souls. Some people think—it is the notion of ecclesiastics—that souls must be saved

in their way or not saved at all. He did not care for the methodology of religion, only for religion itself. He was not so much concerned for saving rich people, titled people, respectable people, as he was to save bad people, to seek and save the lost. There was once a strange Teacher who said, "I came to call not the righteous but sinners to repentance," and William Booth was a man after that Teacher's own heart. And they treated him much as his Exemplar was treated. They cast him out of the synagog; they hooted him, stoned him, called him mad, said he had a devil, but the harlots and thieves heard him gladly, and they became his followers. They were not his apostles, his colonels, brigadiers—Jesus did not take his Twelve from the sunken class—but they filled the ranks, they followed the drum, they shouted and sang, they led the straggling thin procession of bums and beats and sots who came to wonder and remained to kneel and pray. To the poor the gospel was preached.

Many a man has been a street preacher, but who else had the wild enthusiasm to do the impossible that needed to be done, and then the cold executive ability to create the organization to do it? Before William Booth there had stood ever the presence of the red-coated British army, the embodiment of organization and force. So he took the organization and all the intensity of force and applied it to just the opposite end, to saving people instead of killing them. A Briton dearly loves red, and he put a dash of soldier red into his Salvation uniform, and with drum and fife he marched thru the city slums, calling for recruits for the Lord's army. He told the outcast he could be saved, the harlot that she could be saved, just as Jesus had done. It was not a respectable way; it was odd, really indecent; but so they said of old; and it succeeded. So had Methodism been out of decency in the days of the Wesleys, but they gave a halo to squalor, and General Booth did the same over again in his day. Have we not all been amazed when we first saw the little squad of a Salvation Army led by a "Major" or a woman "Captain," and wondered if this were not a travesty of religion; but we followed unobtrusively on the sidewalk to watch the trailing, ragged stragglers that followed the fife and drum until we came to the bare hall—no cushions, no pews, no dim religious light, but fervor and confession and tears and—salvation for the lost. They are all over the world now, and hundreds of thousands of lost men and women have found themselves and found God, all because thirty-five years ago William Booth had the inspiration, the revelation of a prophet, and with it the courage of a soldier of the Cross.

But General Booth was not all the preacher of spiritual religion. His Master fed the hungry and healed the sick, tho He had no home of His own. General Booth knew that religion which does not care for the poor and suffering can never reach the heart. He was a master organizer of helpfulness to those who needed help. He called in the outcasts of the highways and hedges to his supper. He invited thieves to a dinner that they might first eat and then he told of the bread of life. The Salvation Army moved, like that of Tommy Atkins, on its commissary department. He was the greatest teacher of charity the age has seen.

Is his Salvation Army a Church? Why not? Its members might be members of the old churches or they might not—it made no difference—ordinances and sacraments do not make the Church; they are its adjuncts, more or less important, but not essential. Anything that is making the kingdom of God in Christ's spirit is a Church. The Salvation Army is a genuine Church, without priests or sacraments, tho called an Army. For may we not have churches, under other names, organized to make bad folk good, to make the weak-willed strong-hearted, to

seek and to save the lost, no matter how far lost, in the spirit of Him who, with a thief on each side of Him, glorified the cross?

Home Rule Success

The British Government has achieved a magnificent success, against all possible obstruction, aided by threats and absolute disorder, in putting thru the committee stage of the House of Commons the Home Rule bill. The final action by the House has been delayed a week by the disgraceful exhibition by the Unionists, which required the sitting to be closed, and the bill will not be sent to the House of Lords before the middle of January. But that is assured, and its rejection by the Lords is assured, and it will have to be re-enacted by the Commons a year later before it can become law. For all the bluster we do not anticipate that it will be resisted in Ireland when finally enacted. Next the Commons must pass another of its great bills—that for the disestablishment of the alien Anglican Church in Wales.

Forty-four years ago, in 1868, the great fight for disestablishment in Ireland began, and great was the terror of the supporters of the Church. But all their fears have proved groundless. The Anglican Church has had no strength in Ireland, and has as much dignity as before, and is doing more good. Not one of the British Dominions wants any Church established any more than do the Episcopalians in this country. Disestablishment in Wales will be achieved, to be followed in time by like accomplishment in England itself. Why should a Prime Minister, who may be Lloyd George himself, choose the bishops for the Established Church of which he may not be a member?

When Arbitration Will Not Work

We have never claimed that arbitration is applicable in all sorts of wars. Some diseases are so suddenly deadly that no medicine has time to reach them. When a man is bitten by a cobra or snapped up by a shark he is a dead man; he is past hope.

So there are wars that come so suddenly that there is no chance for arbitration. Arbitration requires that two nations are in a quarrel with each other and are willing to take time for reflection. But sometimes the worst of wars are not between two nations, but are civil wars within a single nation. Had the court of the Hague been in existence at the time of our civil war it could not have intervened. There were no two nations to arbitrate between, and neither party would have agreed to leave the question of secession to any outside party's decision. Equally in the case of the Boer war the conflict was within the territory claimed by the British government, and was held to be a civil war.

But these are old stories; we have had two wars within the year just ended, which were not civil wars, and which might be supposed to come within the purview of the Court of the Hague; and yet neither party appealed to the Hague, nor did any friendly nation offer mediation.

No mediation, no arbitration was possible in the late war between Italy and Turkey, because it was simply a war of aggression on one side. Turkey did not expect it. Italy thought it a good time to seize Tripoli and she determined to take it by the right of major force. It is just as when a brigand attacks a traveler. There is no chance for arbitration, no opportunities for appeal. Turkey was at war before she knew it. Italy would not arbitrate, and it takes two to arbitrate. Italy had the example before her of Austria, which had just taken by force Bosnia and Herzegovina, and was not yet satisfied. Italy wanted Tripoli, was afraid Germany or some other power would take it, and so she determined to allow no chances, but would seize it while she could. This was no case for arbitration.

The present war between Turkey on the one side and Greece and Balkan States on the other is a somewhat different case. The four allies had made up their minds to fight. They wanted to free Macedonia and Thrace from the rule of Turkey, and to annex them to their own States. They were utterly angry with Turkey, and thought the time had come to get revenge and attain success. They could not appeal for arbitration, for arbitration could not give them Turkish territory. They had appealed to the powers that had made themselves responsible for decent conditions in Macedonia, and had got no satisfaction. Why should they appeal to the Hague, which could not give them what they wanted? It is the business of the Court of the Hague to deal only with rules of international right; and by all international law Macedonia and Thrace were not Bulgarian nor Greek, but Turkish possessions. The purpose of the allies was to overthrow the rights of Turkey and deliver the lands from a hated ruler. It was largely a war of benevolent sympathy in which they engaged, mixed with selfish greed. No doubt they felt that their success would be of great benefit to the people of the territories they believed to conquer, just as Italy fully expected and intended greatly to improve the condition of Tripoli. Good motives and bad, yet sadly confused in such a war, just as was the case in our war with Spain.

The Court of the Hague can never abate war until its powers are greatly enlarged, and it has force behind it to forbid such wars as these, and to compel reforms in case of oppression. We may yet reach a condition of international solidarity when the units of nations shall thru their international police suppress such disorders as now exist in Mexico, where we are holding back our hand because we do not want to take the sole responsibility of doing what ought to be done; and when there shall be a power in our international executive to enforce the reforms which have for years made life in Macedonia not worth the living.

The Red Hat

We wish we knew which, among the fourteen reasons that *The Catholic Citizen* has heard mentioned why Archbishop Ireland did not get the red hat, are the true ones. Our own guess is that the Archbishop's chance to become a Cardinal was, if ever, during the pontificate of Leo XIII, and the Jesuits were chiefly responsible for preventing it then. His chances were very much lessened with the accession of the new Pope. The power behind the throne, Cardinal Merry del Val, is not his friend. Very possibly his activity in the press at the time of the Fairbanks incident at Rome operated rather against him than in his favor. We are not surprised that the Jesuits, who seem to rule at Rome, are so opposed to him.

The New Haven Railroad Suit

President Mellen, of the New York, New Haven & Hartford Railroad Company, President Chamberlain, of the Grand Trunk Railway Company, and A. W. Smithers, chairman of the Grand Trunk's board, have been indicted for violation of the Sherman Anti-Trust law. This statute makes unlawful "every contract, combination in the form of Trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States or with foreign countries," and any one indicted under it may be punished, if convicted, by a fine of $5000, or imprisonment for one year, or both. In this case there was no contract, but the evidence shows the beginnings of what is alleged to have been, or to be, a conspiracy. Interesting and novel features are presented by the prosecution of these officers. President Chamberlin's predecessor, the late Charles M. Hays, who was lost with the *Titanic,* had planned an extension of the Grand Trunk's lines from Palmer, Mass., to Providence,

and from White River Junction, Vt., to Boston. Construction work on the route of the proposed road to Providence was begun some months ago, but was suspended on Nov. 9. The projected roads would have paralleled the existing roads of the New Haven Company, and there was to be a Grand Trunk line of steamships from Providence to New York. The Grand Trunk was to be able to compete actively with the New Haven (which practically monopolizes the railroad service of New England) for traffic with New York, prominent cities of the Middle West, and the Pacific Coast. Such competition was expected and by many residents of New England it was desired.

As we have said, work was suspended on Nov. 9. It is now shown by the indictments that the three indicted officers began in August to consider propositions for an agreement between the two companies. These propositions were modified from time to time. In their latest form they provided for no sale of Grand Trunk property, but related to a joint traffic contract, and the use of each company's rails and terminals by the other. It is unnecessary to point out the details. In substance it was provided that the Grand Trunk should be permitted to use the New Haven's roads and terminals to such an extent that the construction of the projected parallels would really add nothing to its facilities. But there is no evidence that a contract was entered into or that an agreement as to the details was reached. Indeed, it was reported at the end of last week that the Grand Trunk had decided to take up again the construction work that was suspended in November.

No combination has been effected by merger or by the purchase of railway property. No agreement relating to the traffic and rates involved has been completed and accepted. There has been only a consideration of terms which might be embodied in an agreement. This consideration is held to have been an unlawful conspiracy, in that it prevented the construction of new roads which would have been used in competition. There has been no suppression or restraint of competition, because there has been no competition to be restrained. If there were now in force an agreement, and if the companies should be forbidden by injunction to carry it out, it is difficult to see how the Grand Trunk could be compelled to construct the projected parallels, and to compete by means of them, if it should decline to do so. Again, it is assumed that the effect of an agreement, the provisions of which had not been finally determined, would be an unlawful, unreasonable and harmful restraint of trade. As the effect cannot be shown by a record of practice or results, it may be difficult to show that the assumption is warranted. It is apparent, however, that the purpose of the New Haven was to prevent, while that of the Grand Trunk was to avoid, construction of the parallel roads.

We are not attempting to defend the New Haven company. The attitude of many residents of New England toward that corporation, together with reports as to its rates and service, tend to prove that its conduct leaves something to be desired. But, for reasons suggested by what we have said, it may be difficult to secure conviction of the indicted officers. If they should not be convicted, the public should not condemn prosecutors or jury for failure. The case against the Beef Trust defendants was not affected by some of the difficulties that are seen in this one, but they were acquitted.

This case suggests some questions. The interest of the public should be sought. Are the existing railroad lines in the territory affected sufficient for the business to be done? Are the projected parallels needed for handling the business? If they are not needed for the traffic, would the public gain anything in the end by the construction of them? The history of our railroads shows that the construction of competing parallel lines has in several instances been

followed by severe and even ruinous competition in rates, by the bankruptcy of one of the competing corporations, and the consolidation of its property with that of the other. If there are now enough roads in New England and if the rates are too high and the service unsatisfactory, are not the State governments and their Railroad Commissions, with the aid of the Federal Interstate Commerce Commission, able to apply a remedy? Is it not within their power to regulate rates and service? If so, and if the existing plant is sufficient for the traffic, why should they look for regulation to the construction of costly parallels by a foreign corporation?

The Call for a Maecenas

No one has volunteered to be a Mæcenas for the young man whose letter asking for a patron we published a month ago. From the letters received on the subject we select the following:

"The letter is sufficiently unusual to deceive the young writer. He probably thinks that few others have had his thoughts and none have made his appeal.

"Your readers would perhaps like to know how this young egotist will feel ten years from now. I can tell them. Ten years ago I had an idea for a great romance. I knew it to be new and original. No story had been written even suggesting my plot or treatment. I believed God had granted me the theme I had prayed for. I believed I had the ability. I had, in my opinion, everything but the time. I begged for that in words not unlike this unusual letter. I didn't get the help, and I am heartily glad that I did not.

"I have not written the romance yet. I was not ready to write it. I was striving for self-glorification. I wanted time and ease in which to make people lionize me. I am not ready to write now. But the happy struggle for bread, the failures incident to living, the passing years, nobler and better motives, all have changed and lifted my story, and when it is written, if it is ever written, it will be worth the years I have carried it in my heart.

"Four years ago a scholarship offer did come for recognized worth along purely academic lines. It meant the leisure for study and work for which I had begged. I refused it. I had grown into the full strength of manhood. So my motive grows more worthy, so the theme seems more worth while. If it should never be written, at least it has made my own soul the richer and since because of it I have been able to realize more keenly the joys of this pleasant world and to dream more closely to beyond, I have been a happier source of information, a better companion, and this is more than sufficient reward."

Nevertheless we believe in egotists when they have the brains and decision to believe in themselves. We like to see a young man who is determined to make the great statesman, scientist or poet that he believes he can be. There are such geniuses, such prodigies, and why should they not? They "know the worth of their bays?" Did not Milton with "The Ode to the Nativity" at the age of nineteen? Most will overvalue themselves, but the arrow aimed at the sky will go higher than one shot along the ground.

Independent Albania

One of the happy results of the Balkan war is the assurance that Albania will be made independent. Albania has fought Turkish intermeddling, but she has gladly fought for the Turks against Christian foes. We should not regret to see one little Moslem state retained in Europe to show again what Mohammedanism can do in the best conditions of independence. A letter from Rev. C. Telford Erickson, a missionary in Albania, thus quotes one of their leaders at a time when absolute independence was not anticipated:

"Our first and highest wish as Albanians is constitutional rights under

Turkish rule—the free use of our language in schools, literature, government administration, etc., taxes to be employed in improving our own land, building roads, schools, improving agricultural conditions. If we cannot have that we would prefer Austria to rule us, for she would merely send a few government officials into the country and leave us a large measure of autonomy. Next we will take things as they are—the persecutions, the abuses, and all. Our last choice would be Italy. She is too close to us. Her people would swarm over to our unoccupied land and overwhelm us. We could never compete with them."

Mr. Erickson says that many would dissent as to a preference for Austria, but nearly all would agree with the rest. The little province is getting more than it could ask.

The Principle of Association

Boston has been the place of meeting during the past week of a remarkable group of seven societies, the American Historical, American Economic, American Political Science, American Statistical, Mississippi Valley Historical, New England History Teachers, Sociological and Labor Legislation; and during the meetings developed an efficiency society, and a conference which may perhaps later take form as an American Utility Historical Society. Each of these organizations has an independent existence, but the practice has been established of the whole or parts of this group assembling at the same time and place because the members of all societies are likely to be interested in the work and proceedings of the other people. This combination expresses the interest of nearly ten thousand members in the problems of history, government and social welfare, and has become a strong influence upon public opinion on these subjects. The membership includes most of the college and many of the secondary teachers on these subjects; and also a large element of investigators, social workers and practical men and women. The item in the programmes which aroused the widest interest was the address of Theodore Roosevelt as president of the American Historical Association for the year, in Symphony Hall before a large audience. His subject, "History as Literature," avoided reforms and disputed questions of government, and is a plea for the writing of interesting history by people who are trained scholars.

Each one of the associations grappled with practical problems of their craft—the Economic Association for instance with the cost of living, the labor legislation association with the minimum wage, the Historical Association with archives and history teaching; the Political Science Association with governmental efficiency and with journalism. The whole affair was centered in one hotel and neighboring buildings and halls in Copley Square (except for a day at Harvard University). The note of the meetings was a feeling of responsibility for providing materials and bringing about discussions of the everyday problems of the American people. Most of the societies, besires this annual meeting, keep up a system of investigating committee publications and other activities. Taking together the group of societies is one of the vital forces in America.

A New View of Economy

Prof. Simon N. Patten, instructor in economics in the University of Pennsylvania, recently told his auditors that the common idea of household economy is largely a mistake. He does not think that young people should be brought up to rigid habits of self-denial. He would have all young men and girls buy according to their desires, rather than according to their purse; spending beyond their income at times, borrowing even in order to be able to reach their desires. He considers that a young girl is safer morally and otherwise who can sustain her respectability and her rank with well-to-do people by

dressing well and in good taste, rather than by dressing poorly in order to sustain a bank account. This is a novel position to take, and is well in the teeth of what we have supposed to be the experience of fathers and mothers and instructors.

Anyone with a drop of Yankee blood in his veins will reply that to save is the first law of household economy, if not of Christian manhood. Yet the history of New England is very inconsistent along this line, because while saving at one point, the Yankee was surely wasting at other points. He carried all over the continent a spirit of tightness as to household economy, but astounding wastefulness as to the general gifts of Nature. We are just waking up as a people to the fact that this very stingy Yankee let the larger part of our national heritage wash off into the ocean, go up in smoke, or in some other way get out of the coffers of the people. Conservation of national resources means nothing more or less than that our forefathers were terribly reckless in the handling of enormous treasures. We have got many years of hard work ahead to put things in shape, so that we shall not have eaten ourselves out of house and home before the middle of the Twentieth Century.

France stands high industrially and commercially because the French people above all others know how to save. A girl's marriage dowry is begun as soon as she is born, and something is saved toward it every year until she is married. Children are taught in this way to save, and it becomes a second nature in all the common French families to lay something by for future needs. Take this trait from the French people and you would probably remove entirely their capacity for contending successfully with other European nations.

Ben Franklin would put the two replies together and tell us that a penny saved is as good as twopence earned; and he would work on the principle that national life as well as individual success depends upon this sort of thrift. It would be difficult for any professor of economics, we imagine, to make a good reply to Franklin's adages; and yet it is in the very City of Brotherly Love, where Franklin worked out his axioms in more ways than one and demonstrated their utility, and where he was followed by such men as Girard, that we hear the new doctrine preached: Spend according to your taste and desire, whether you can have a surplus or not. Understand that we are not exactly discussing this proposition of Prof. Patten; we want to see whether it has anything more than novelty.

Possibly we shall find nothing more apparently in accord with the spend-as-you-go doctrine than that which is contained in the teachings of Jesus. In the very heart of the Lord's Prayer we read, "Give us this day our daily bread." That sounds as if Jesus intended to teach his disciples to ask for only a day's supply, and to work on that principle. Yet we cannot forget that the disciples carried a bag and had a surplus for a rainy day. Whether economics that belong to New England would exactly cover Palestine, or reversely, those of Palestine cover the Empire State, is a question. At any rate if we interpret Jesus on the Patten basis, we must go somewhat farther and make a socialist of him completely; that is, we must hold to the doctrine as Christian, that everything must be owned in common and no storages made. If we acknowledge this to be Christian economics, we have got a new sort of contest on hand.

We are altogether more confident, however, of one reply to our Professor. The southern negro will surely accord with all that he says, and will illustrate it by living up to it. The vital difference between a Caucasian and an African is that the former, at least in the Anglo-Saxon branch, believes with all his soul in savings banks, while the latter can hardly be persuaded that it is necessary to leave over anything from his daily wage. Give him enough to eat and drink and plenty to wear and he is content. The

whole battle between the races is just at this point. When the negro adopts the savings bank he is well on the strife to equality of power with the whites. At present few see the need of these deposits. To him a good dinner in hand, good digestion and lots of good nature cover the case. His sleep is never disturbed by worrying over a bank-book.

The savings-bank reply is the national reply. We have grafted it into our postal system at last, and so has every other leading nation, that economy is at least the second of all virtues. Temperance comes first, temperate use of all our powers, temperate use of all our property; but close after that prevision and provision for tomorrow. Every private citizen is expected to have his budget for next year just as much as every corporation. This is getting trained into our lives and methods of thought and our emotions, and we are glad of it. We are Anglo-Saxons specifically at this point. We are glad that the Yankee waste of national treasure is going to have a stop. We believe that national prosperity at least must be very temporary that is based on any principle but rational economics.

A re-discussion of the principles of personal economy is certainly worth the while. Is it necessary that we shall meet youth when at its full, with a demand that it lay aside part of its earnings for old age? It cannot comprehend the problem, as it cannot comprehend old age itself. Yet this principle is at the bottom of German and English plans for pensioning old age. It underlies the postal savings bank system; a system that considers young people as wards of the government, but compels them to anticipate and provide for an old age that many of them may never reach.

Does man differ in anything from the animal more than in his power of looking ahead and getting ready for the future? Yet some of the rodents are close on our heels in this respect; and as we have seen there is a vast difference in the economics of different races. The negro is less saving than the white, but he is happier. He knows nothing of the weariness of wealth. The socialist slyly asks us if the millionaire is, after all, the model of highest civilization. Does a big bank account render valueless faith in God? Auerbach took Benjamin Franklin for the international Savior; the Oriental laughs and points to Confucius, whose chief virtue was also saving economy. Nothing is sure only that nothing is sure. Even axioms are not safe in these days.

A Mighty Revival

Far be it from us to condemn, much less to ridicule, such an organized revival as that which has lately been concluded at McKeesport, Pa. It is claimed to have been the most immense and successful revival ever known in history. It was conducted by the evangelist, William A. Sunday, and was conducted after the most approved manner to arouse fervor and draw converts to the altar. The whole town and the neighborhood were drawn into it, so that no room was large enough to contain the crowd. There was immense enthusiasm when the number of converts reached ten thousand, more than at any other one of Sunday's campaigns, and the mayor was drawn forward with the others. We do not see why persuasion and excitement and thunder and lightning and earthquake are not useful incitements to startle and drive a man into conquering a stubborn will so that it may give up a selfish for an unselfish life, which is the substance of conversion; certainly when conscience is deaf to the still, small voice which an Elijah could hear. Yet it does somewhat displease one to see the comparative table printed at the end of the revival showing how much larger the roster of converts is than in the revivals in other towns, and just how many more hundreds of dollars were collected at the last meeting to pay the expenses than anywhere else. Cannot the time

come—has it not already come in a measure—when the quiet springtide sun of teaching and example shall gently bring our youth almost unconsciously into the kingdom of God, without waiting for the hurricane to beat down the old trees?

We may note that Evangelist Sunday's copyrighted sermons seem free from his familiar eccentricities; but he was himself when in one sermon he said:

> When a man becomes so intelligent that he cannot accept the Bible, too progressive to be a Christian, that man's influence in society, in business and as a good citizen is at an end.

and a man shouted out, "I deny that!" The ten thousand people were in an uproar, and policemen started to put the man out, when Sunday shouted, "Let him go! I can rip any skeptic up the back, you ever saw! Leave him to me! Let him alone! I can lick any five men you ever saw!" Really to the hyper-educated, Miss Nancyist observer that does not seem quite in good taste, but perhaps, altho the denial was justified, Sunday had the psychology of it, for we are told that at the end of the sermon between 300 and 400 persons went forward "making a total of more than 2000 converts for the campaign so far." We are glad to be told that as a result of the revival McKeesport is to be "cleaned up."

How Miscegenation Laws Work

Louisiana is one of the States that have a law forbidding marriage of whites and negroes, negroes being those who have any trace of negro blood. In that State many have a small fraction of negro blood, but nobody knows or cares until some one makes trouble. We take the following from the New Orleans *Picayune* of November 29, as quoted in the *Crisis:*

> "She's my wife. We have lived together thirty-eight years. The law cannot estrange us." Thus spoke Joseph Lawrence, a white farmer, in the second criminal court at New Orleans, La., recently, while he was awaiting trial on the charge of marrying a colored woman. Through the arrest of Lawrence and his colored wife the police discovered a hard situation. All around Lee Station the white farmers and fishermen and other classes have intermarried with colored people and reared large families regardless of the law against such. A number of arrests have been made, but it has been impossible to convict one for the reason that the white parties all went on the stand and swore they were colored. Just what the prosecuting attorney can do remains to be seen.

It is an infamous law.

The Pope has addrest an encyclical letter to the bishops of Germany, telling them that while it is desirable that Catholic workmen should belong to Catholic unions only, yet they may join with non-Catholics where necessary for their interests, provided the unions are not conducted on unchristian principles. That would shut them out from such unions as that for whose crimes thirty-eight men have just been convicted.

Much public notice has been given by the sudden resignation and departure of a leading Episcopal rector in Philadelphia on the advice of his bishop, the reason being withheld. Whether the reason were his change of faith (he is an extreme high church man), or some moral obliquity, it would seem better to have no concealment, and to save over-much gossip.

The first day of January, 1913, is the fiftieth anniversary of the greatest legal reform in the history of this country, if not of the world. On that day slavery was abolished as an act of war by President Lincoln. Success followed, and union was maintained and emancipation assured. Today every one blesses Lincoln the great Emancipator.

The Governor of Arizona has gone a step beyond all others in Progressive policy in recommending that the constitution of the State be changed so as to abolish the useless Senate. He wants to get nearer to the people.

The British doctors are giving way; they will accept positions under the Insurance Act in defiance of the British Medical Association. Equally the Ulster opposition to Home Rule will fizzle out.

The firing of a bomb at Lord Hardinge, Viceroy of India, means nothing more than that there are fanatics there, as here, and that dynamite can be had. India is not honey-combed with sedition.

We rejoice to know that the Southern Presbyterians and the United Presbyterians have agreed in committee on a basis of union. So the good work proceeds. Who should hold back?

An Unshrinkable Dollar

By Irving Fisher

[Professor Fisher, of Yale, presented to the American Economics Association, on December 28, the following ingenious proposal for a monetary unit which would correct the prevailing tendency toward high prices. The article will be reprinted, together with a report of the discussion it provokes, in the Proceedings of the Association next March Professor Fisher is the author of numerous works on mathematics, the theory of value, the purchasing power of money, conservation and public health. In THE INDEPENDENT of Sept. 26, 1912, he proposed "A Stable Monetary Yardstick" as a remedy for the rising cost of living.—EDITOR.]

The high cost of living is seldom thought of as a monetary question; yet it always is and must be to a certain extent a monetary question, for, whatever may be the cause or causes of high prices, whether the flood of gold or other factors, or a combination of both, certain it is that *high prices always imply a low purchasing power of the dollar.* It is evident that the fact that prices have risen since 1896 in the ratio of 2 to 3 may be exprest by saying that the dollar has fallen in purchasing power in the ratio of 3 to 2. This fall in the purchasing power of the dollar, or, as some people prefer to express it, its "depreciation," is now an incontrovertible fact as abundant statistics show. Moreover there are strong indications that this fall of purchasing power will continue in the future. My present object is to indicate a possible remedy. In so doing, I am not denying the importance of other remedies and am not claiming to provide a panacea for all the ills associated with the phrase "the high cost of living." The remedy here suggested does not take the place of economies of production, nor does it concern itself with incomes and earning power. It aims merely to establish a more stable unit in which to measure all these things, to convert our dollar into a fixt yardstick of purchasing power.

In my address before the International Congress of Chambers of Commerce, I outlined the plan in a very few words. Since then it has been much discussed. But it has been so often misunderstood that I am taking this earliest opportunity to make a fuller statement of it than was possible in the two pages devoted to it in the address above mentioned. I must refer readers desiring still fuller and more technical details to the closing chapter of my "Purchasing Power of Money" and to a forthcoming article in the February number of the *Quarterly Journal of Economics,* reprints of which I have already available for distribution.

Briefly stated the plan is virtually to *increase the weight of the gold dollar.* This is in accordance with a thought once expressed by President-elect Wilson. The aim is to compensate for losses in the purchasing power of gold by, virtually, putting more gold into each dollar. As fast as each grain of gold loses in purchasing power, the loss is offset by adding the necessary number of grains of gold to the dollar.

We so seldom see gold coin that we are apt to forget that the ultimate unit of money in the United States is a certain weight of gold. Many people are under the impression that a dollar is something created by Government "fiat." It is, as a matter of fact, a unit of merchandise. Underlying every bank note, greenback or other form of money which we handle daily is a gold dollar with which this other money is interconvertible. This dollar is at present 25.8 grains of gold, nine-tenths fine.

The fact that every dollar, whether coin or paper, is practically interconvertible with 25.8 grains of gold bullion—mere merchandise—fixes the value or purchasing power of the dollar. Every dollar must be worth what 25.8 grains of gold bullion is worth—no more and no less.

In Mexico the weight of the gold dollar is about half that of the American dollar and consequently it takes about two Mexican dollars to buy one American dollar and the purchasing power of the Mexican dollar is about half of that of the American dollar. That is, prices in Mexico, in terms of

Mexican dollars, are about double what they would be if measured in American dollars. Some of the South American dollars are much smaller in gold equivalent than Mexican dollars and therefore prices there are still higher. A dinner in some places in South America costs several thousad dollars.

Both on the grounds of theory and facts we may accept as sound the principle that the lighter the gold dollar the less its purchasing power and the more magnified the scale of prices. Reversing this, we may say that to increase the weight of the South American and Mexican dollars would increase their purchasing power and cause a shrinkage in the scale of prices.

What is true for South America and Mexico is true for the United States. An increase in the weight of the dollar would tend to increase the purchasing power of the dollar and to reduce the scale of prices. Evidently if we can find some way to increase the weight of the dollar just fast enough to compensate for the loss in the purchasing power of each grain of gold, we shall have a fully "compensated dollar," that is, a dollar which has constantly restored to it any purchasing power it may lose by gold depreciation. This would be "an unshrinkable dollar."

We now have a dollar of fixt weight (25.8 grains), but varying purchasing power. Under the plan proposed, we should have a dollar of fixt purchasing power, but varying weight.

But, the reader will ask, how is it possible to have a dollar of varying weight without the annoyance of a constant recoinage of gold coin? Moreover, if this can be done, how can we know at any time what weight the dollar ought to be without leaving this to the tender mercies of some political official? Here are two very vital questions.

As a preparation for answering these two questions, it will be a little easier to explain the principle of the proposal if for a moment we assume that there are no actual gold coins in circulation, but only gold certificates. This supposition is, in fact, not very far from the truth in the United States. For, outside of California, there is very little actual gold coin in circulation. We have instead nearly a billion dollars of gold certificates in circulation, representing gold in the Treasury of the United States. We are supposing for the moment that gold circulates in no other way. Under these circumstances it is evident that the ultimate gold dollar is out of sight in the Treasury of the United States in bars of gold bullion. Every 25.8 grains of this gold bullion is a *virtual dollar* behind a dollar of gold certificates outstanding. A gold bar (of standard bullion) weighing 25,800 grains virtually contains 1,000 gold dollars.

The gold miner takes such bars of standard gold to the Mint and deposits them without waiting for their coinage, receiving gold certificates in return, one dollar of gold certificates for each 25.8 grains of standard gold which he deposits. On the other hand, holders of gold certificates may at any time receive gold bullion in return, when they desire this for export, or for use in the arts of jewelry, dentistry, gilding, etc., receiving 25.8 grains of gold for each dollar of gold certificates. Thus the Government on demand gives money for bullion or bullion for money at the rate of 25.8 grains of bullion per dollar; the virtual, though invisible, dollar being this 25.8 grains of gold bullion, nine-tenths fine.

It is evident that the number 25.8 grains is purely arbitrary. It might be half that amount, as in Mexico, or a much smaller fraction, as in South America. But most people assume that this figure, 25.8 grains, having once been fixt, as it was eighty years ago, must never again be changed, the idea being that to change it would be to disturb our unit of value. Unfortunately our dollar as a unit of value is being disturbed every minute. The problem is how to prevent such disturbance.

The proposal here made is to change the weight of the dollar as an offset to changes in value. If there are no gold coins, it is very easy to do this. For example, if there should be a decrease of one per cent. in the value, *i.e.*, purchasing power of gold, then the weight of gold bullion which constitutes the virtual dollar would be declared one per cent. greater, becoming 26.058 instead of 25.8. If there should be an increase in the purchasing power of gold, the weight of the virtual dollar would be reduced accordingly. Whenever the gold miner took gold to the Mint, he would receive a gold certificate not necessarily at the rate of one dollar for each 25.8 grains of standard gold, but for a larger or smaller amount as the case might be, the amount always being that amount which would possess the same purchasing power. Similarly the holder of gold certificates who wishes them redeemed in bullion for export or for the arts, would not always get exactly 25.8 grains for each dollar of certificates, but a larger or smaller sum, as the case might be. Thus the Government would be receiving gold from the miner and giving it out to the jeweler just as at present, but in varying weights per dollar, instead of at the arbitrarily fixt weight of 25.8 grains. The weight of gold per dollar in which, at any particular time, gold certificates were redeemable would constitute the virtual and only gold dollar. Under these circumstances it is clear that it would be entirely feasible to change up and down the weight of the gold dollar (*i.e.*, the amount of gold bullion interconvertible with a dollar of gold certificates), and without any recoinage or other interferance with the outward appearance of the currency in our pockets.

We should familiarize ourselves with another way of stating all this. Instead of saying that the Government receives gold bullion at the Mint and uses this for redeeming gold certificates, we may, if we prefer, say that the Government buys and sells gold. It buys gold from the miner, sells gold to the jeweler, who redeems these certificates. At present, the price at which gold is bought and sold by the Government is $18.60 an ounce (for standard gold nine-tenths fine). This is easily figured out from the weight of the gold dollar; for 25.8 grains of gold being our present dollar, each ounce (or 480 grains) of gold bullion contains 480/25.8 or 18.60 virtual dollars. To say, then, that we now have a fixt weight in our gold dollar, 25.8 grains, is the same thing as to say that we have a fixt Government price for gold, $18.60 per ounce. To raise the weight of the gold dollar one per cent., or from 25.8 grains to 26.058 grains, is the same thing as to lower the Government price of gold from $18.60 to $18.42 per ounce.

We come now to the second question: How would it be possible to know the proper adjustments to be made in the weight of the virtual dollar—the gold bullion interconvertible with each dollar of gold certificates—without putting a dangerous power of discretion in the hands of Government officials? In other words, how can the adjustment in the weight of the virtual dollar be made automatic? The answer is: By means of statistics called "index numbers of prices." Such statistics are today published by the *London Economist*, the United States Bureau of Labor, the Canadian Department of Labor, and several commercial agencies, such as Bradstreet. The index number of the Bureau of Labor is based on the wholesale prices of 257 commodities, and shows from year to year the extent to which prices on the whole advance or fall. Thus, in any one year, some of the 257 commodities may rise in price more than others, and some may not rise in price at all or may even fall; but the index number shows the *average* movement of all the 257.

There are various systems of index numbers, but they practically all agree remarkably well with each other. When once a system of index numbers is decided upon, their nu-

merical calculation becomes a purely clerical matter. A statistical bureau (as for instance the present Bureau of Labor or an international statistical office) would compile and publish these statistics periodically and the actual prices on which they were based. If at any time the official index number showed that the price level had risen one per cent., this would be the signal for an increase of one per cent. in the virtual dollar.

The plan, then, is: First, to provide for the calculation of an official index number of prices; second, to adjust correspondingly the official weight of the virtual dollar at which the Government shall issue gold certificates to miners or redeem them for jewelers, in other words to adjust the official prices of gold at which the Government stands ready to buy or sell at the option of the public.

This, then, is the plan in brief—a plan virtually to mark up or down the weight of the dollar (*i.e.*, to mark down or up the price of gold bullion) in exact proportion to the deviations above or below par of the index number of prices.

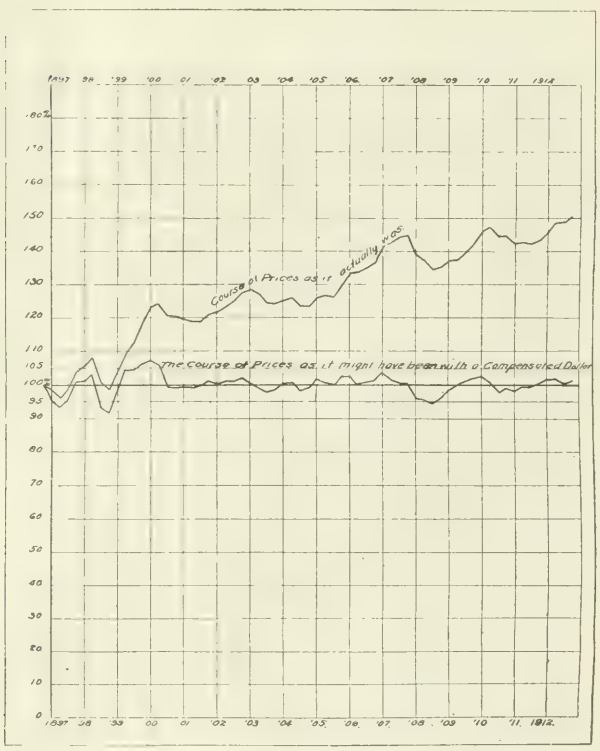
A few additional details essential to the working of the plan may now be briefly mentioned. The reader is still waiting to see how actual gold coin could be used in such a system. To be continually recoining the gold in circulation would, of course, be quite impracticable. But this would be unnecessary. Existing gold coin would remain unchanged at 25.8 grains per dollar, and new gold coins would be given the same weight. Gold coins would simply become what the silver dollar now is, token coins. Or, better, they would be, like the gold certificates, mere warehouse receipts, or, as it were, "brass checks" for gold bullion on deposit in the Treasury. Otherwise exprest, *gold coin would be merely gold certificates printed on gold instead of on paper.* They would be used exactly as gold certificates are used—namely, issuable to the gold miner in return for his bullion, and redeemable for those who wished bullion for export or in the arts.

The excess of bullion over the weight of the coined dollar itself would be analogous to what has generally been called "seigniorage;" so that in a sense, the plan may be described as a plan to restore the ancient custom of seigniorage on gold coin. Thus, if the virtual dollar were at any time 35.8 grains, the excess of ten grains above the weight of the coin dollar, 25.8 grains, would be "seigniorage." The gold miner, in return for every 35.8 grains of standard gold bullion taken to the Mint, would receive, at his option, a gold certificate on paper, or a gold certificate on gold (*i.e., a dollar gold coin*) —the latter containing, just as at present, 25.8 grains. Any holder of gold coin, old or new, and any holder of gold certificates could receive from the Government gold bullion at the official rate declared from time to time. He would thus be receiving a larger quantity of gold bullion than the amount of bullion in the gold dollar. The gold coin would then, like all our other coins, be worth more as coin than as bullion, and its value would be determined just as the value of a gold certificate or any other paper money is today determined, by the ultimate bullion with which it would be interconvertible, this bullion being of greater weight than the weight of the dollar itself.

The only real complication which would be introduced by allowing gold coin to remain at its present weight and fineness would be to limit the operation of the system when prices tended to fall below the par or starting point at which the system began. The weight of the virtual gold dollar could never be reduced below the weight of the coin dollar; for if this were done, the seigniorage would become a minus quantity and all the gold coin would be immediately melted into bullion, being worth more melted than coined. One proviso, therefore, in the system would be that the weight of the virtual dollar should never be *less* than 25.8 grains and that therefore the Government price of gold should never be *more* than $18.60 per ounce.

Perhaps, in view of the present dissatisfaction with high prices, many people would not object to this limitation, which permits prices to fall below the present level, but does not permit them to rise further. Yet it is a poor rule that will not work both ways. Consequently, while I personally look forward to an upward tendency of prices in the future, the possibility of a downward movement should be provided for. For this purpose, gold coin could, if desired, be recalled at the outset and recoined in lighter weight, just as the Philippine peso was recalled and reduced in weight when the recent rise in the price of silver threatened to lead to melting the silver pesos. But I do not advocate crossing the bridge until we come to it. It would be sufficient to provide in advance for crossing it in case we should ever come to it. This could be done in one of two ways. It could be provided that, if ever the price level should, in the future, sink more than, say, ten per cent. below the original par or price level from which the system started, all gold coins should then be withdrawn from circulation and gold certificates employed instead. In this way we should be rid of any complication from the use of gold coin, and would be at liberty forever after to adjust the weight of the virtual dollar downward as well as upward. Or, if preferred, it could be arranged that when prices should sink more than the suggested limit of ten per cent. below the original level, we should then recoin and reduce our gold coins. This would merely mean that the gold on which we print our gold certificates would be reduced in weight. It would not, of course, reduce the value of the gold coin any more than the reduction in the weight of the Philippine peso which was made for a similar contingency—or, to take an example nearer home, the reduction of ten per cent. in the weight of our subsidiary silver coins half a century ago —had any tendency to reduce the value of these coins.

If the latter plan were chosen, the amount of reduction in the gold coin should be enough to provide a comfortable margin for any similar emergencies in the future. Any subsequent recoinage would thus be deferred a long time and similar provision for them could be made. Personally, I should prefer the former method, eliminating gold coins altogether.



Another essential detail is a proviso to avoid speculation in gold disastrous to the Government. This would be accomplished by means of a slight Government charge, say one per cent, for minting. This charge, which existed in former days, is called brassage. It would mean that the price at any particular date at which the Government bought gold would be slightly less than the price at which it sold it. Without such a margin to protect the Government, it is evident that when the Government raised its price, say from $18 to $18.10 an ounce, speculators might, in anticipation of this rise, buy all the gold in the Government vaults at $18 in order to sell it back to the Government immediately after the change in price, at $18.10, thus profiting ten cents per ounce at the expense of Government.

Similarly, a fall in price, say from $18.10 to $18 per ounce, would encourage the opposite form of speculation. Holders of bullion would then rush it to the Government to sell it at the present rate of $18.10, and immediately after the change in price, buy it back at $18, thus profiting again ten cents per ounce at the expense of the Government. If, however, the Government were protected by a brassage charge of one per cent., and if it were provided that no single shift in the Government pair of prices, whether they were both moved up or both moved down, should exceed the "brassage" or margin between them, it is clear that no such speculation could occur, for there would be a greater loss from the payments of brassage to the Government than any speculative gain possible from the change in price.

Other details relate to the provis-

ions for establishing and maintaining a gold reserve at the outset where no such reserve existed in the first place. In the United States we could utilize the 50,000,000 oz. of gold already in the Treasury for the very purpose of redeeming the $900,000,000 of gold certificates outstanding.

Space is lacking for any discussion of the numerous supposed objections to the plan and of the exact way in which it would work. A diagram has been calculated showing roughly what

The upper and rising line shows the course of prices as it actually was. The lower line, deviating only slightly from the level, shows the course of prices as it might have been with a compensated dollar.

would have happened had the plan been in operation since 1896. Our price level today would have been practically the same as it was then, instead of fifty per cent. higher.

Suffice it to say that the mechanism for preserving the equality between money and bullion would be exactly the same as the mechanism by which this equality is preserved at present. This mechanism now keeps our scale of prices about fifty per cent. lower than the scale of prices in Mexico. It keeps our dollar worth 25.8 grains of gold and it could keep it worth 26 grains or 30 grains or any other number required from time to time.

After carefully examining all objections which have been offered, I quite agree with Mr. Babson, the business statistician, who writes that "only those disagree with you who misunderstand you."

In spite of all the adverse criticism based on the few lines of newspaper reports of a speech mainly devoted to another subject, the great mass of opinion is favorable, and is growing more so continually. My colleague, President Hadley of Yale, unreservedly endorses the plan, as do most other economists. A number of financial journals, a number of presidents of banks, business statisticians and men in high positions throughout the world have done the same.

Besides these allies, there is another and more powerful ally to help any logical argument for standardizing the dollar, and that is the grim and constant rise in the cost of living. It must be clear that our present gold standard, so called—a standard really of weight and not of value—has wrought untold mischief. For a quarter of a century—from 1873 to 1896—the dollar increased in purchasing power and caused a prolonged depression of trade, culminating in the political upheaval which led to the free silver campaign of 1896, when the remedy proposed was worse than the disease. We have since then had a reverse movement, and the growing clamor of discontent is daily adding to the ranks of the socialists, also ready with quack remedies. Unless a really scientific remedy is enacted, society will be imperiled by those who, while feeling the pinch from changes in monetary standards, do not recognize the cause.

A laboring man who put $100 in the savings bank fifteen years ago and now withdraws his $150, fondly imagines that he has 50 per cent. more than he put in. But when he comes to spend it he finds that his whole $150 will buy no more than his original $100 would have bought in 1896. In other words, the depreciation of gold has tricked him out of all his interest. Naturally he is discontented, and wants to attack something, he does not much care what.

He is one of millions of victims of a shrinking dollar, just as, twenty years ago, his father may have been one of the millions of victims of an appreciating dollar.

Instead of a standard which first benefits the creditor at the expense of the debtor, and then benefits the debtor at the expense of the creditor, let us have a system which gives a square deal to all.

We have standardized every other unit in commerce except the most important and universal unit of all, the unit of purchasing power. What business man would consent for a moment to make a contract in terms of yards of cloth or tons of coal, and leave the size of the yard or the ton to chance? Once the yard was the girth of a man. In order to make it constant, we have standardized it. We have standardized even our new units of electricity, the ohm, the kilowatt, the ampere and the volt. But the dollar is still left to the chances of gold mining. At first we could not standardize units of electricity because we had no adequate instruments for measuring those elusive magnitudes. But as soon as such measuring devices were invented, these units were standardized. We have hitherto had a similar excuse for not standardizing the dollar as a unit of purchasing power, and so a standard for deferred payments; we had no instrument for measuring it or device for putting the results in practice. With the development of index numbers, however, and the device of adjusting the seigniorage according to those index numbers, we now have at hand all the materials for scientifically standardizing the dollar and for realizing the long-coveted ideal of a "multiple standard" of value. In this way it is within the power of society, when it chooses, to create a standard monetary yardstick, an "unshrinkable dollar."

New Haven, Conn.

New Year

By Katharine Lee Bates

Green year, green year,
Sweet with sun and showers,
A windblown spray whose blossoms bright
Are the seven-colored hours,
A dancing spray whose leaves delight
In azure gleam and silver haze,
Green year.

White year, white year,
Muffled soft in snow,
A diamond spray whose gems are gone
Before their grace we know,
A crystal-coated spray whose hours
Melt when looked upon,
Hoarfrost stars and hoarfrost flowers,
White year!

New year, new year
From rosy leaf to gold,
A shining spray on the Tree of Time
Where myriad sprays unfold,
A spray so fair that God may see
And gather it, bloom and rime,
To deck the doors of Eternity,
New Year!

Wellesley, Mass.

Gipsying to the South

How Gumption and Faculty Made it Possible to Hunt Health and Pleasure and How We Found Both

By Alice M. and M. F. Hackley

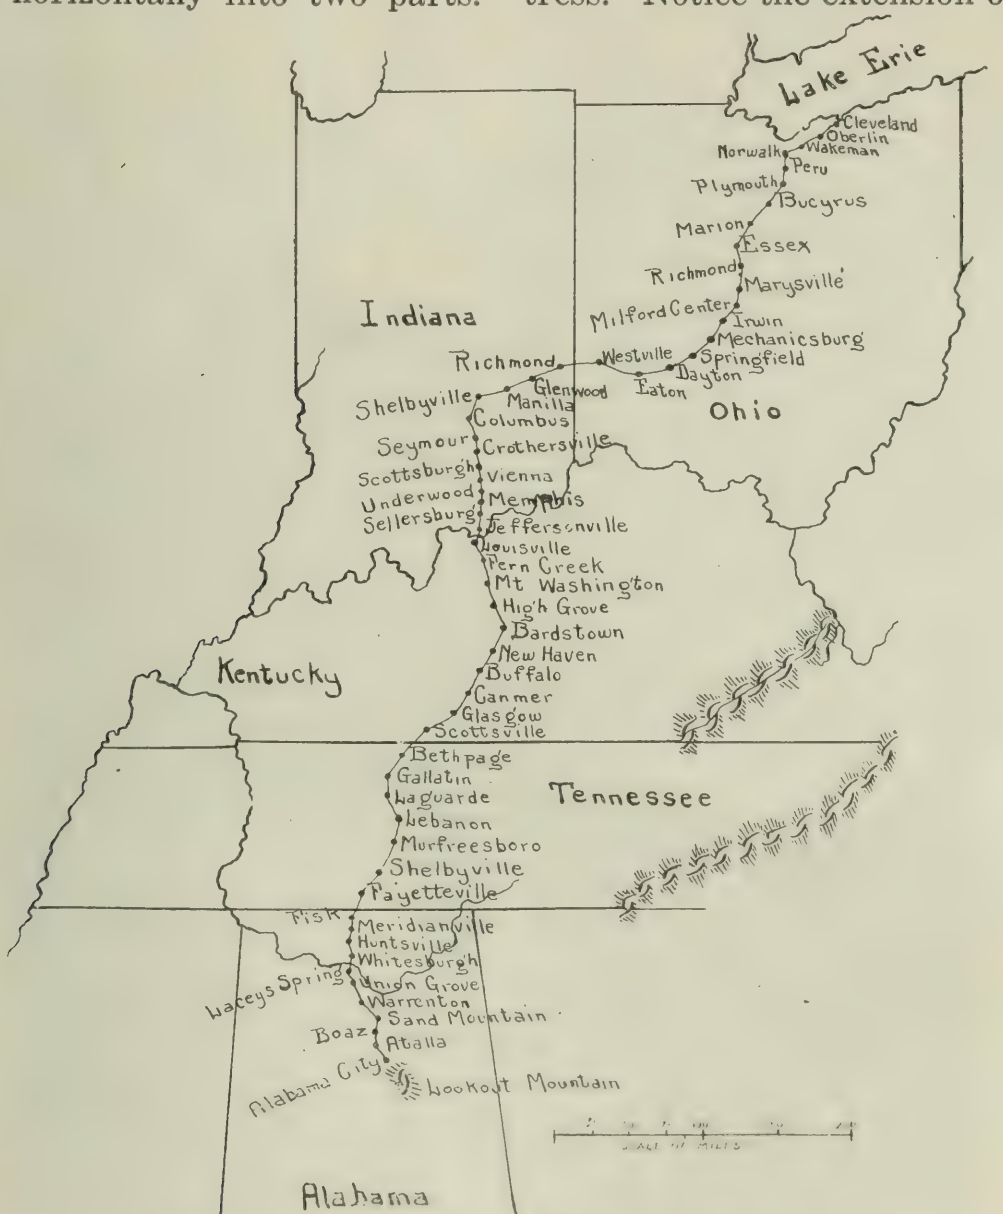
In these days, when we hear demands on every hand for "fresh air" in the "simple life," it may not be amiss for me to describe our experiment in attaining these desired ends, with very little outlay. This experiment, let me say at the outset, was so successful on its initial trial, that we repeated it twice; and now we feel it has become almost a habit, so enamored are we of the out-door life.

Our venture came about in this way. We live on a small farm in northern Ohio. In summer, one could not wish for a lovelier home, or a more salubrious climate; but the winter is too rigorous for anyone who is not in good health. A few years ago, the family physician told my husband that he ought to give up work, go South, and live out-of-doors, during the severe months. Such a mandate at first simply dazed us, so impossible of realization did it seem; but we soon began to discuss ways and means. We found that two round trip tickets to the mountains of northern Alabama, the locality suggested, and the board after our arrival, would be quite beyond our slender purse, so, with a "middle west" counterfeit of what the Yankees call "gumption," we set to work to find a solution of the difficulty.

As we reviewed the situation, the first thing in our favor, seemed to be a determination to follow the advice of our medical man. Just that very resolution gave to the project, an appearance of *wahrscheinlichkeit,* as our German friends would say. At this point two important questions confronted us. The first was, if railroads were beyond us, what other means of locomotion could we find? Next, if the man of the family was temporarily incapacitated, how could the woman help? For it was patent to us both that she must be the wage earner for the time being.

The latter problem was the more easily disposed of; perhaps I could teach, as I did before our marriage, if we could only reach the Southland; for the schools in that region, we found, did not open until November, and closed in May.

Then we discussed our assets, and these proved to be, as far as the first question was concerned, a good sound horse, Dolly, by name, and a love of camping out. Dolly should be our means of locomotion, and our fondness for camping, would make the journey a beautiful and prolonged picnic! Not living in the era of pillions, we must think of some other device, whereby one horse could be made to carry two mortals. That question was finally settled; we could have a top made for our light farm wagon, keeping down the weight for the horse's sake. Having reached this decision, we proceeded to prepare for our expedition.



In order to help others who may wish to go and do likewise, let me describe our "caravan," and show some pictures of it; but it is only fair to say that poor Dolly is not in reality the "hammer-headed beast," which she appears to be. That eccentricity is due to her being out of focus, thanks to the amateur photographer!

The wagon, as I said, was one we had. It was nine by three feet. The top was made by an ingenious blacksmith under the direction of my husband, who planned it all. It was built one foot wider, and one and a half feet longer than the wagon box. It was fastened to the latter by four long bolts, making the whole safe and indivisible during the journey. The covering was unbleached muslin, sized with beeswax and oil, and painted inside and out with a quiet

shade of gray. The entire weight of the outfit, including its occupants, was about 1200 pounds.

Now for a description of the exterior of the caravan. Do you see that box in front of the dashboard? It is divided horizontally into two parts. hung on hooks, are a lantern and pails.

So much for the outside. Inside, across the back, is the bed. Do not say it is too small; for it is six feet long and holds a three-quarter mattress. Notice the extension on either

SKETCH MAP OF THE ROUTE—ABOUT 900 MILES

The upper half contains one and a half bushels of oats; and the lower, an oil can, a wagon jack, wagon grease, and Dolly's toilet articles!

Across the back of the wagon, you will see a pole and rope, with which we shall stake out the horse. Beneath the projection of the top, at the back, are fastened our ladder and the blankets for Dolly's use. On the shelf at the side, we carry hay. Under the wagon in front of the ladder and side over the back wheels; this, added to the width of the wagon box, gives the required length.

Under the bed, we carry our clothing in an old-fashioned "extension-case," which, when divided, gives one part for my husband's use, and the other for mine. It is needless to say that we did not burden ourselves with a great amount of wearing apparel. It was necessary to have a suit apiece for every day, and one for

best, with change of underclothing appropriate for cold or warm days and nights, for we traveled from the forty-second to the thirty-fourth degree north latitude, and so experienced a variety of temperature. We also kept our household linen under the couch. All campers will understand that, in order to economize space, we carried few articles and had them washed frequently.

In front of the bed, may be seen our "Happy Rover" camp stove, made in Hamilton, Ohio. It is twenty-four inches long, fifteen inches wide, and eleven inches high. It has a good oven and a fire box, in which we burned wood gathered along the roadside. On this little stove, I cooked anything that could be boiled, or fried, or baked, (with the exception of bread, which requires too hot a fire for the wagon; but I baked very good bread in it, "if I do say it as oughtn't," when we used it later in our house in Alabama). The wagon wall behind the stove, was protected against fire, by a sheet of zinc. The stove pipe went straight up from the stove, but did not protrude more than four or five inches above the roof, in order to avoid catching as we passed under overhanging boughs.

On the opposite side of the wagon, is a shelf-table, which hooks up when not required, and this we covered with white oilcloth. Under the table, and acting as a support for it when down, is a miniature cupboard, made with a light wood frame, and similarly protected. This held our white enamel table ware and cooking utensils. There is sufficient space in which to walk between the stove and table, when the latter is down in place. At meal time we remove our spring wagon seat, and one of us uses a camp chair at table, while the other sits on the bed.

Across the inside of the dashboard, is a series of shallow shelves, on which we keep tin or glass cans containing provisions, our few books, writing materials, and a supply of medicines. We carry our drinking water in a large demijohn strapped by its handle to the corner of the wagon. A sufficiency of good water is absolutely necessary, as one often camps near rivers or creeks, where the horse can drink, but where we would not dare to, in this age of precaution against typhoid.

A HALT FOR REFRESHMENT

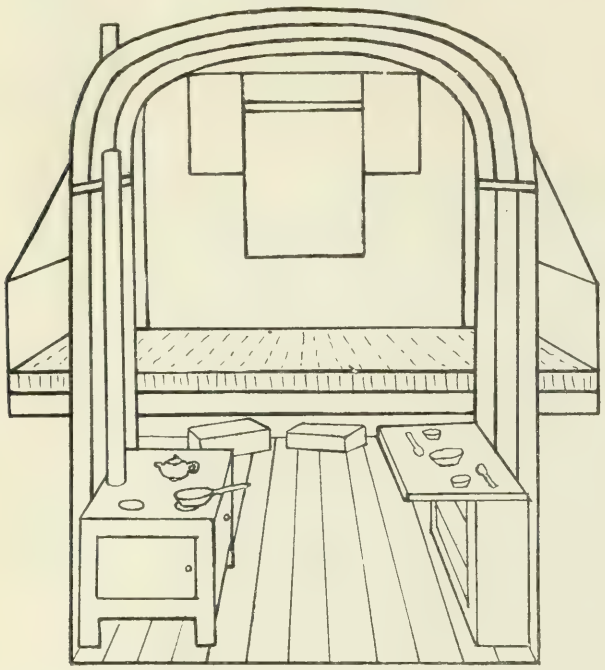
The opening at the back of the

caravan, may be closed, partially or entirely, by a canvas curtain rolling up and fastening with buttons such as are used on the side curtains of surreys. On either side of this opening, is a small stationary window of celluloid glass. One side of the wagon, near the front, may be closed by a canvas curtain rolling down and buttoning. Opposite to this is a door, of the same material, which is easier to use as a means of egress, while camping.

We can completely close the front opening by a frame containing a large sheet of celluloid glass, and held in place by wooden cupboard buttons. If forced to drive facing a storm, we put up this frame, pass the reins through a slit in the dashboard, and sit safely inside, while guiding our good horse who is protected by a rubber blanket. When not in use, this frame slips between the cupboard, shelf-table and wall. Under the roof projections, close to the top, in the center of both back and front ends, are small openings through which we can always have ventilation, without the rain driving in.

This journey of between eight and nine hundred miles, took us fifty-seven days to accomplish. Our expense account, when we reached our objective point, read thus:

Wagon top	$25.00
Camp stove	5.50
Granite household utensils	4.00
3 Maps	1.00
Food and other items	65.00
Total	$100.50



ON THE ROAD

That amount seems to us little enough, for two months' entire expenses, including journey and board for two people and a horse, especially as we were able to continue using the contents of the caravan, when we started housekeeping in our little mountain cabin. The stove and wagon top served their purpose on three such journeys.

For the sake of being sure to choose good roads, as well as the shortest way, we endeavored to purchase reliable road maps of the five States through which were to pass. We were unable, however, to find any except for Ohio and Kentucky, (published by Mendenhall, Cincinnati). In Indiana, Tennessee and Alabama, we were forced to use Rand & McNally's ordinary pocket atlas, which at least gave us the direction in which to go; but it may aid some one wishing to undertake a similar trip, if I add a rough map of our entire route, giving only the

towns and villages through which we drove.

We left home early in September, as it was necessary to accustom ourselves to sleeping out before the nights became too cold. Before leaving, we gave an itinerary of our route-to-be, to friends and relatives, who sent us newspapers and magazines as well as letters, in care of the various post offices. The first two we passed on to courteous people along our line of march, in recognition of kindly attentions from them.

CROSS SECTION OF THE GIPSIES' CARAVAN.

We made a resolution that on no account would we travel on Sunday for, apart from the religious side of the question, one day a week ought to be reserved for perfect physical rest, both for horse and owners. We adhered strictly to this rule, and we feel sure it had much to do with the fact that we were able to endure the journey so well. We averaged sixteen miles daily, without the least harm to our steed. We started early and rested during the heat of the day, especially as we approached the South.

On cold or stormy nights, if we were near a settlement, we usually stabled Dolly; and a few times, on similar occasions, we persuaded some inhabitant to give us shelter also. This, however, we resorted to only when necessary, as we came to prefer the airiness of our little house on wheels.

We always planned to reach the outskirts of cities or villages, (if we could not get to the open country before night-fall), asking permission to drive into a vacant lot, for we had no desire to be the "observed of all observers," when we pitched camp. We found, however, that the ideal camping ground was a woods, near a water supply, for the sake of the equine member of the party.

Soon after our departure we decided that "caravaning" was the most fascinating form of out-door living; and we were able to say, with George Borrow's gipsy, of the joys of the wayside traveller; "There's night and day, brother, both sweet things; sun, moon and stars, brother, all sweet things; there's likewise a wind on the heath. Life is very sweet, brother."

It is certainly the most satisfactory mode of enjoying the scenery. We were able to stop in any lovely valley which appealed to our fancy, or beside some boisterous mountain stream, or in some restful woods, which less fortunate people must steam past at sixty miles an hour!

As time advanced and we passed from one State to another, the beauty to be seen on every hand altered but did not diminish. I remember driving for miles at two different seasons, over a certain road in Kentucky. Once it was in autumn, when the brilliant foliage of the deciduous trees contrasted brightly with the dark and neighboring evergreens. Again it was in spring, when most of the trees were just bursting into leaf; the charm of the tender green, together with the pink blossoms of the "red bud," silhouetted against the same somber woods of cedar, will long be "photographically lined on the tablet of my mind." One of the most beautiful sections through which we drove, was, of course, the blue grass region of Kentucky and Tennessee. When we reached the

South, the holly and mistletoe, those holiday scarcities of the North, greeted us on all sides, and made us feel as though we were looking at a delightful and permanent Christmas card.

One's sense of humor, as well as one's sense of beauty, can find food for enjoyment at almost every turn. Once, on the outskirts of a small village, a quaint old specimen of the rustic police, a veritable dogberry of the law, accused us of being peddlers. Once in a small place in Alabama, where we stopped to buy supplies, we found all the stores closed, as if the owners were on holiday bent and we were informed that "Everybody has done gone to the berryin'." For a brief instant we had visions of a wholesale "berry picking," and then we laughed, and waited until the mourning village returned, and the shop-keepers resumed their occupations.

Among the interesting episodes in a journey like ours, is the crossing of numerous rivers in the various ways provided. The water ways near important places, were usually spanned by carriage bridges, either toll or free. On many others, we found small steam ferry boats. Besides these, we tried ferries run by gasoline, hand or horse-power, and, much to the delight of Dolly, we forded the streams. We thought the highways as a whole excellent, but we did meet a few execrable mountain roads.

On our arrival at our destination in Alabama, I took the necessary examinations at the county seat, and was given a school on Lookout Mountain. There we dismantled our caravan, after renting a small place with a cosy cabin and a barn for our faithful Dolly. While I attended to my duties as instructor of youth, my husband planted a tiny garden and raised chickens.

When we started North again, we not only felt that we had spent a delightful eight months, but we rejoiced that the invigorating mountain air and mild climate had produced the result hoped for, when we began our experiment of gypsying to the South.

Rowayton, Conn.

How Mount Holyoke Freed Itself from Secret Societies

By Elizabeth Crane Porter

At least one of the women's colleges may claim to be well on toward a solution of the secret society problem. But the problem there was still complicated enough to be interesting and serious.

The five societies of Mount Holyoke had in the twenty years or so of their existence come to be thoroly entrenched in the life of the college. They were started, when Mt. Holyoke was going thru a period of reconstruction, with the admirable motive of adding to her equipment everything then supposed to be part of a model college. Every one was very proud of them then. But partly perhaps because of their local character, they grew to have an extraordinary firm grip on everything connected with the life of the undergraduates. As the college grew, the rushing came to be a distressing perversion of normal social life. Freshmen did little but talk over so-and-so's chances for such-and-such a fraternity and their own schedule of engagements for the next few days. The rushing season was long and gave plenty of time for a promising girl to acquire either a "swelled head"—which "queered" her with her contemporaries—or a series of low grades—which "queered" her with the office and often led to her return to her puzzled and outraged family.

The rushing itself was simple enough, as it was prohibited during class hours and was limited to a certain number of engagements a week with any one society. However to the freshman's eye the life of the college was so colored by the whole business that the most casual meetings were significant and every sally forth upon the campus a new adventure.

The whole college was self-conscious. Society people could not mention their organizations to freshmen and seldom spoke of them even to their particular friends. Non-society people kept apart from all the rushing, looked on with disapproval at the treatment of the freshmen and kept silent except among themselves. The freshmen who were rushed gossiped in most of their spare time and behaved with circumspection before upper class girls, and those who were not being rushed went about miserably, stiffly or inconspicuously as their temperaments demanded.

The non-society people formed the majority of the undergraduate body, but most of the time they were too disgusted with society electioneering to oppose it and too nebulous a body to realize that they had any force of public opinion. The faculty looked on in distress at the state of affairs, tho it is to be doubted if most of them realized how things stood; it was known that they disapproved of societies but that any changes must first come from the students themselves. After a time the societies began to overreach themselves in the matter of elections, and there were several extremely disagreeable contests that hung on the society question. Societies that were known to be after offices for their members could always get them nominated, but the other societies usually opposed and the non-society girls quietly refused to vote for any society member. They took little pains with their own nominations, but they would stubbornly vote ballot after ballot and even hour after hour for the non-society candidate. The result was the really competent and fine girls from the societies did not hold office even when they were by nature amiably democratic.

Things got in such a muddle finally that a few non-society girls

began to protest in the college magazine and call for more frank discussion of the subject, more sensible treatment of the freshmen and a better mutual understanding. They claimed that the society people had no idea how bitterly the bulk of the college was opposed to them; nor did the non-society people understand that there were laudable aims and occasionally real achievement on the part of societies as such. They announced that discussion of the question would continue thruout the year. The day the paragraph appeared the oldest sorority issued cards for a tea in its hitherto quite private room. The non-society people went, and the college began to talk openly. Then all the other societies opened their rooms, and before long they announced that there would be no more rushing and that students would not be taken in before their sophomore year. Finally a society alumna attacked societies chiefly because of their effect on the girl inside—the false ideas of loyalty that make her wear herself out in inconsequential matters, her waste of nervous energy, the danger of her missing the best intellectual benefits of college and of making friends of only her own particular kind. Then came the formation of a committee of students, alumnae and faculty to weigh the whole situation.

About that time public opinion turned all the way over, like an unruly church bell. People talked plainly, the societies did some real thinking and everyone was eager to have the thing thrashed out. After about six months of fruitful discussion the president called a mass-meeting of the society members and put to them the question of abolishment as advised by the committee, the vote was strongly against perpetuation. It was a fine example of the essential fairness, open-mindedness and real democracy of the college woman, as well as the firm and tactful course of President Woolley. Many of the society alumnae could not see the effect of a few undemocratic societies on a large, well-housed college, and as their vote for disbanding was not obtainable, a faculty vote finally abrogated the charters. The effect on the college was the same, however, for the sentiment in the societies was still a conviction of their own unfitness to exist in that kind of college.

Of course while the societies are in process of discontinuing, plenty of girls, tho opposed in principle, still feel that their convictions will not suffer if they taste the apple, as the tree will shortly be taken out of everybody's reach. But everywhere in college is quiet relief that societies are going.

"You can thank your lucky stars that you are out of it all," says the one class that can remember any thing of the old system, and general opinion, now articulate and stronger than ever before, is quite against exclusive secret societies at Mount Holyoke.

The advantages of the change are beginning to be apparent already. For one thing, the entering classes have a far more natural social life. In the close life of a college with dormitories for nearly all the students, there is no danger that the freshman will not get to know upper class girls. Moreover she is not now restrained by the limits of her "crowd" as she used to be if she joined a society and can make her own friends for herself in her own class. She is more likely to be interested and broadened by contact with girls of a different type from her own than if she had been absorbed into a clique that by its collective choice had made itself into a group consisting of a single type. There is now much less of the experience that many non-society girls went thru with—a wretched conviction during their first year that because they were not rushed there was something horrible the matter with them, a bitter and neglected sophomore year and an awakening

sooner or later to the possibilities of an independent existence. Morbid girls will go through it in any case, but such a career is not now fostered among girls of the normal average type.

The regular college organizations are all gaining by the concentration now possible. There was a time when dramatic and literary organizations, for example, had difficulty in having any intercourse based entirely on their reasons for being. Society meetings, society electioneering and society friendships interfered everywhere. There are cliques now, of course, but they do not carry the prestige of a fraternity, they do not perpetuate themselves and they are not ironclad.

The final solution of the matter is likely to be found in the centralizing of the social life of the college and the closer connection of the college girl's social life with her intellectual interests. The new Student-Alumnae Building which Mount Holyoke is soon to build will be a center for all activities, both executive and social. There is already a non-exclusive social club which provides a dance and a play every week or so. With a free field it should develop well. Various schemes are afloat for providing points of contact between all returning alumnae and students such as the active chapters used to provide for a few. Student hostesses appointed at intervals would give to all the old girls the characteristic welcome that delights '59 and '99 alike.

The success of Mount Holyoke's experience in dealing with so delicate a problem was largely due to the straightforward way every one took hold of the subject. Considering the number concerned there was little quibbling or begging of the question; and in view of the feeling that any society member has for the memories connected with her college friendships, remarkably little rancor over the result. In every such situation the fairness of the students may safely be trusted, for the college woman, even in her flighty undergraduate days, has a fine sense of citizenship and of personal responsibility for the community.

New York City.

Our Canal Treaties and Tolls

By Herbert W. Bowen, M.A., LL.B.

[It is not yet too late for this Congress to rescind its action exempting American coastwise shipping from its share of the canal expenses and by such action to prevent the repudiation of our agreement with Great Britain. That we gained greatly by Great Britain's willingness to substitute the Hay-Pauncefote for the Clayton-Bulwer treaty is shown in this article by Mr. Bowen, former Minister to Persia and to Venezuela. EDITOR.]

On November 18, 1901, Mr. John Hay and Lord Pauncefote concluded a treaty, commonly called the Hay-Pauncefote treaty, which was declared to supersede the convention that had been signed April 19, 1850, by Mr. John M. Clayton and Sir Henry Lytton Bulwer, and that is known as the Clayton-Bulwer treaty.

The object the government of the United States had in view in negotiating the Hay-Pauncefote treaty was to secure the right, which it had surrendered by the Clayton-Bulwer treaty, to proceed independently of Great Britain to construct a ship canal from the Atlantic to the Pacific oceans, and to enjoy the exclusive privilege of providing for the regulation and management of it. It is to be presumed that when the Clayton-Bulwer treaty was made the governments of the United States and Great Britain each considered that it had effected with the other a satisfactory arrangement in binding each other never to "obtain or maintain for itself any exclusive control over the said ship canal," and in agreeing that neither government

should "occupy" or "exercise any dominion" over any part of Central America, or fortify the canal, or "take any advantage of any intimacy, or use any alliance . . . for the purpose of acquiring or holding, directly or indirectly, for the citizens or subjects of the one, any rights or advantages in regard to commerce or navigation thru the said canal, which shall not be offered on the same terms to the citizens or subjects of the other." In view of Great Britain's world-wide maritime interests and her colonial connections in the Western Hemisphere the Clayton-Bulwer treaty might well have been regarded as peculiarly satisfactory to her; but so far as the United States was concerned it proved to be a monument of shortsightedness, especially as it contained no provision permitting us to denounce it. Permanent treaties are permanent restrictions, and they should not be entered into by a growing, a virile, and an ambitious people unless the conditions they recognize are practically as unchangeable as moral truths are. Conditions generally change with time, and in regard to this canal question they changed with extraordinary rapidity the moment we understood that the French had abandoned their work at Panama. We realized that we could not permit the project to fail, and that we alone were in a position to execute it. But our hands were tied by the Clayton-Bulwer treaty. We could not denounce it nor ignore it, for it was as binding as any contract, public or private, could possibly be. All that we could hope, therefore, was that Great Britain would consent to make with us another treaty that should supersede it. She did consent, but on condition that the United States would give to British and all other foreign ships the same treatment that American ships would receive when the canal was opened. That condition was evidently acceptable to our government, for it was incorporated in these words in the third article of the new treaty:

> "The canal shall be free and open to the vessels of commerce and of war of *all nations** observing these rules, on terms of entire equality, so that there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic, or otherwise. Such conditions and charges of traffic shall be just and equitable."

There has been some quibbling as to the meaning of the words "all nations," but the insistent, persistent and consistent intention of Great Britain has indisputably been from the very beginning that when the canal is constructed and opened to the commerce of the world the ships of all nations must be treated alike and not simply the ships of all nations other than those of the United States. If the United States had intended at the time the third article was under consideration to secure preferential treatment for our ships and if Great Britain had been induced to consent that they might receive such treatment, the words, "All nations," would not have been used, for they mean each and every one of the nations of the earth. The truth is the idea of favoring our ships originated only after the new treaty was signed, and after the canal zone had become a part of the possessions or territory of the United States. But it was too late then for any one to try to make the plain meaning of the treaty ambiguous, and it was also too late to raise the cry that the United States, being sovereign over the canal zone, could favor our ships passing thru the canal as freely as we favor them when they are engaged in trade along our coasts. Great Britain evidently foresaw that our government might acquire sovereignty over the canal zone and that an effort might be made by us to provide for exclusive privileges for American ships: at all events the fourth article of the Hay-Pauncefote treaty provides that "No change of territorial sovereignty or of international relations of the country or countries traversed by the . . . canal shall affect the general principle of neutralization or the obli-

*The italics are mine.

gation of the high contracting parties."

It is clear, therefore, that we were, and are, bound by the Hay-Pauncefot treaty for all time to place other nations, of whatever flag, on terms of "entire equality" with ourselves "in respect of the conditions or changes of traffic."

Our natural tendency, of course, is, and always will be, to try to assert complete sovereignty over the canal; but as by our Constitution our treaties are made the supreme law of the land we must observe them until we are duly released from the obligations which they impose upon us. We can not expect Great Britain, however, to yield to us always, nor to renounce valuable treaty rights to us on demand without receiving from us any substantial *quid pro quo;* and we certainly can not honorably or legally arrogate to ourselves the right to suppress articles, provisions and stipulations of any treaty we may have with her without her consent. We should, therefore, have consulted her first before attempting to relieve our vessels engaged in the coasting trade from paying the same tolls that other ships, native and foreign, will have to pay to pass through the canal. She has good reason to feel aggrieved at the course we have pursued, and also to be surprised, for she remembers how strongly we protested against the action of Canada in rebating tolls on the Welland Canal. What was wrong in principle then is wrong in principle now, and, therefore, Great Britain is perfectly justified in now objecting to our remitting tolls to our coasting vessels, and making her ships assist in paying them. The tolls should be paid by all ships alike, and if we wish to reimburse our coasting vessels we should do so out of our public treasury. There is nothing in the treaty to prevent us from doing that. Whether we should do it or not is simply a domestic question. The canal tolls, on the contrary, constitute an international question, for we are bound by the Hay-Pauncefot treaty to make them "just and equable," and they are to be collected from "all nations" on terms of entire equality. Great Britain's contention that we must abide by an agreement in those matters is both proper and reasonable, and it is inconceivable that arbitrators, worthy of the name, could hold otherwise. For that reason those that advocate the remission of tolls for our coasting vessels are unanimously opposed to arbitration. They know perfectly well that we have nothing to arbitrate as there can be no honest difference of opinion as to what our obligations are. They are stated in the treaty. Why, then, try to avoid fulfiling them? Why attempt to repudiate our own solemn act? Our coasting vessels are well able to pay the tolls. They are known to be doing a thriving trade now, paying $4 a ton charges over the Panama railway. It is useless, therefore, to claim that when the canal is open they will not be able to pay $1.20 a ton. They want protection, but they do not need it. That being the case we should now with quickened conscience and renewed zeal turn again to our international obligations and undertake to meet them worthily and creditably so that when the canal is finished and opened to the commerce of the world our regulation and management of it will be regarded by all other nations not only as "just and equitable" but also as efficient and conducive to the greatest possible development of trade.

A nation great and strong enough to construct a waterway like the Panama Canal can not but be great and strong enough to perform its international duties fairly and fully.

Woodstock, Conn.

A Bulgarian Election

By Aleko Konstantinoff

[When Russia liberated Bulgaria from Turkish rule a little over thirty years ago no one expected that the newly established little government would be able to manage its own affairs without interference. Naturally that would be Russia's function, with possible annexation to follow. Surely a race of illiterate peasants could not govern themelves. But the expected internal turmoils did not occur. In spite of Russian intrigues Bulgaria maintained her foothold and finally sent Russia about her business. Troubles there were, but Bulgarians solved their own differences. One of the most potent influences in attracting the attention of the Bulgarians to their own shortcomings was a book written by a young Bulgarian journalist, Aleko Konstantinoff. It was a series of stories, the hero of which was Bie Ganio, a peasant shopkeeper from Shinka. He travels over Europe, sight seeing and selling attar of roses. When he comes home he applies the knowledge gained abroad to home conditions. The whole series is a bitter satire of Bulgarian manners and customs, yet it has since become the first classic of a national literature. Naturally so young a nation could not escape corruption in politics. That evil was especially flagrant in the early days, when political bosses hired bands of gipsies to terrorize voters at the polls. Konstantinoff, in his role of muckraker, did not hesitate to attack this as well as other wrongs he saw. The following condensed translation of one of the last chapters from *Bie Ganio* will show how little he allowed any false sense of national pride to stand in the way of his purpose. It has had a powerful influence in bringing about reforms, and while Bulgarian politics are to-day far from what they should be, the picture drawn by Konstantinoff is no longer a true one. It is, indeed, disillusionizing to have presented to us such an unattractive picture of Young Bulgaria which on account of its military success we had already begun to idealize, but it must be remembered that Konstantinoff is a satirist and that a foreigner would get quite as unfavorable an impression of politics from reading some of our popular stories and plays. The author was killed at the age of 35 in an election brawl similar to that he described in this story. The translation is made for us from the original Bulgarian by Natalie D. Sonnichsen.—EDITOR.]

"Don't talk so much," shouted Bie Ganio. "I tell you we've got to swing with the government."

"But we haven't the vote," replied Boocheff. "Anyway, Bie Ganio, you once said you were a Liberal."

"When did I say I was a Liberal?" growled Bie Ganio.

"Last year to the Bohemian professor."

"Well," laughed Bie Ganio, "what if I did? Words don't leave holes behind them."

"Well, let's be Conservatives then," put in Doocholu.

"But will the prefect stand by us?" persisted Boocheff.

"The prefect?" cried Bie Ganio. "Of course he's with us. And so's the sheriff. And the commission of elections; to be sure it was illegally elected, but who'll bother about that? That's ours too. And the polling committee is all ours. The municipal council lines up with us too. The mayor is against us, but—we'll soon cut his tail for him. Then there's the district councils in the villages," Bie Ganio winked, "these appointments haven't been ratified, yet. If they go against us, where will they be? Down with them. But above all, the prefect is with us."

"How about the hamalin?"* asked Boocheff, still not satisfied.

"The hamalin are with us, and the rest of the gipsies and Danko Harasin—"

"Isn't he in jail for larceny?" exclaimed Boocheff.

"You're behind the times," replied Bie Ganio. "We got him out. Didn't he fix the hamalin for us? He went to them the other day and he fixed them for two francs apiece and a night of drinking and eating before the election. He went over to the opposition and offered his services for one hundred francs and they chased him out. We got him for fifty. You'll see him Sunday—you wait. Say, go around and call in Gunio the lawyer; tell him I want him to write a proclamation."

As soon as Boocheff had left the room Bie Ganio winked and said, with a lowered voice:

"Keep quiet. We'll fool that idiot until election day by making him think we'll elect him a deputy; we'll fix up a few ballots with his name on. The regular ballots will be written out by the clerks of the municipal and district councils. Now, look here; the Minister of the Interior wants me sent to the Sobranje* without fail. Do you agree?"

"I am agreed," said Doocholu.

"So am I," added Goocholu.

"You know," said Bie Ganio, "you fellows can't go alone. The peasants

*Low caste gipsies who do chores.

*Popular Assembly.

don't like you; you've skinned them too often."

"Well, if it comes to that, Bie Ganio," replied Doocholu, "you——"

There would have been a row, but just then Gunio the lawyer came in, and the business on hand demanded precedence. Bie Ganio sent out for another round of drinks and then Gunio sat down to the task of composition. In half an hour he had produced the following:

TO THE VOTERS OF OUR DISTRICT.

Realizing the vast influence that the coming election will have on the future welfare of the country, over seven hundred of our most prominent citizens met today in the courtyard of the school in Parzal-Mahles and nominated the following candidates for deputies to the Sobranje:

Gania Balkanski, well known thruout Bulgaria.

Filio Goocholu, a prominent merchant with capital.

Tanas Doocholu, dealer in wines.

These are the same candidates that were nominated at the caucus of the National Party on August 27.

We respectfully recommend these candidates to all the voters of our district who have at heart the welfare of the agricultural working classes, the lightening of the burden on the shoulders of the taxpayers and wish to see our district represented in the national assembly with dignity.

Voters: you have had brought before you for consideration the names of other candidates; Nicola Turnovalieta, Lultcho Doctorov and Ivanitza Gramitikov, men who can never inspire our confidence. We advise you not to be inveigled by the eloquent words with which these candidates have been presented to you. Nicola Turnovalieta comes from the town of Turnova, a man who burns the blanket while looking for the flea. Lultcho Doctorov is beyond consideration: he comes from one of the trans-Danube provinces, and Ivanitza Gramaticov is not known to anybody and, note well, he is a Russian by education and therefore a traitor to our country.

Fellow citizens, again we recommend to you our candidates, men known for their patriotism and their devotion to the throne and dynasty of His Imperial Highness, Prince Ferdinand I."

"Well done, Gunio!" shouted Bie Ganio, "you are a regular Bismarck."

"Did you take me for a simpleton?" demanded Gunio, self satisfied.

"Now go to the printer and have it printed in letters as big as this."

"Where's the money?"

"Money? We don't need any money. Tell him if he wants the district and municipal contracts he'd better print it."

"Do you know," continued Bie Ganio, after Gunio had gone, "they've sent a telegram to the Minister of the Interior complaining that the sheriff is campaigning in the villages."

"Silly fools!" exclaimed Goocholu.

"Idiots!" commented Doocholu.

"The new minister knows his business. He answered that the elections must not be interfered with; they must be absolutely free. Ha, ha, ha, ha, ha! He's all right."

"Ha, ha, ha, ha, ha," echoed the others.

"Free! Free! They'll see some freedom on Sunday they'll remember all their lives. They haven't seen our elections yet. Wait till they see the gipsies with their blood-shot eyes and wait till they hear Danko's war yell from behind them!"

"Ha, ha, ha, ha, ha," roared the other two, their eyes dancing with merriment.

"Liberalism," laughed Bie Ganio. "And freedom! They swallow that telegram from the minister whole. How the sheriff and I laughed over it last night! He, for the sake of appearance had this fool telegram printed and posted in the cafes. We were sitting in the cafe last night and heard those idiots reading it out loud; 'There must be no interference by the police. The elections must be free.' The sheriff and I just sat there and kept quiet. I looked at him with one eye. He began to laugh and drank an absinthe. He felt in his pocket for the telegram and said 'no interference,' and we just laughed and laughed. Then, after closing time the boys came in and the musicians tuned up and we drank and drank; oof, my head aches yet. And this evening we'll have to be at it again."

"Aren't we beginning a little early, Bie Ganio?"

"It isn't too early. To-morrow is Saturday and they'll only have thirty-six hours left for drinking. They won't drink all the time. Some will drink for five or six hours, then they'll sleep and others will take

their turn, in relays. They'll eat, drink and sleep there. You understand?"

"We know; it isn't the first election we've seen."

"Now, go ahead, Goocholu; as you pass Gogo's tell him to get ready 300 kilos of bread; send 100 kilos to the gipsies at Parsal, 100 to the hamalin to keep 100. You, Doocholu, make the rounds of the drink shops and give the word: 'free whisky from to-night on. Tell them not to overcharge, or we'll turn them down when the time comes for settling the bills. Last year they cheated us out of about 2000 francs. Then go to the butchers and get all the odds and ends and leavings they have, put it in a big basket and distribute it among the drink shops and have them make soup. This evening the prefect and the sheriff return from the villages and they'll do the rounds with me. Later we'll have the city and county clerks make out the ballots. I've chosen blue and yellow paper. Then we'll fold them. We'll have to get hold of some of their ballots and see what kind of paper they use and how they fold them. Then we'll prepare a few hundred ballots like theirs and have our names on them.

BIE GANIO.

"Ha, ha, ha, ha! You're a good one, Bie Ganio!"

"Why is my name Ganio Balkanski, if I don't know this business? You put me into any district and tell me who you want elected. Nominate a donkey and I'll elect the donkey. Only give me the sheriff and his gendarmes and 1000 or 2000 francs. Then I'll get together forty or fifty husky boys, put them into two or three of the suburban saloons, duck their heads into buckets of whiskey and shout 'Hurrah for Bulgaria!' Then take them on a ramble thru the town when the polls open and you'll see how much opposition there'll be. Then you station the gendarmes on the outskirts of the town to keep the peasants out, surround the voting booth with forty or fifty of the boys, fill up a few ballot boxes with ballots and your donkey becomes a deputy."

"Ha, ha, ha, ha! You're alright, Bie Ganio!"

"Bring me a match," said Bie Ganio modestly. "I know the Bulgarian electorate."

* * *

The dawn was dispelling the darkness within Gogo's saloon in Parsal. About thirty chosen huskies were lying on the floor, snoring like suffocating tigers. From time to time one of them would rise with half open eyes, step across his fallen comrades, reach for the water jug and eagerly extinguish the a l c o h o l fires within. Wherever he steps foul w o r d e d exclamations arise.

Doocholu ond Goocholu are already up, drinking coffee in the Kelish Hassan cafe. It is time to awaken the sleeping army of the electorate. They have started to make the rounds and are in front of Gogo's saloon. They open the door.

* * * * *

"Who is that big fellow over there?" asks Doocholu; "do you know him?"

"Of course I know him. That's Petresk; he drowned his father in the swamp. God help anybody he gets his teeth into. Look at the knife in his sash. Do you know that fellow over there?"

"That fat one with the bandage about his leg?"

"No; that one with the crooked mouth."

"I can't just place him. Let me see; why, yes, that's Cersem Petsinoto who robbed the church."

"No; that's Petsinoto, lying near that bandit Bonchoff. This fellow is the nephew of Danko Harasin. He's an expert. Last night he stole a whole bundle of their ballots."

The army of the voters was awake. The men are already on their legs and the music approaches from the gipsy quarter. With the music in front the army approaches the center of the town. A hoarse roar rose in the morning air; a flock of birds scattered in fright from the neighboring roofs and trees. It was the cheering from the hired men, gathered together by Danko Harasin.

Behind the music march the gipsies and the hamalin. In front, carried by many hands, his mustaches curled up like bull's horns, his cap over one ear, is the Conservative candidate, Ganio Balkanski himself. But even in this triumphant moment Bie Ganio does not forget himself. He holds his hands tightly in his pockets, gripping his pocketbook.

"Hurrah for Bie Ganio, our candidate!" shouts the crowd. "Long live the Prince and Bie Ganio!"

"Good morning, boys!" shouts Bie Ganio, beaming. Then mutters, to himself, "Let them keep away—I don't want them to jostle me. There are bills in my pocketbook."

Spiro Kopoya and Topal Mustafa, who had been sent from the gipsy quarter to reconnoiter, came running into the square and whispered to Bie Ganio that about three thousand peasants were approaching the town from various directions and that the opposition was giving them ballots.

At about seven that morning Ivanitza Gramatikov, the candidate of the opposition, stood on his veranda, breathing in the cool morning air. Young, educated and something of a dreamer and an idealist, he knew little as yet of the hard realities of life. He dreamed of his coming career of usefulness to his country in the national assembly, for he was an optimist by temperament, and with a consciousness of his own motives, did not doubt his election.

His pleasant dreams were broken by the town clock striking the half hour. He took up his walking stick, but remembered that the election laws forbade anyone from entering the polls with a weapon. So he left his walking stick and went down toward the center of the town. A group of friends met him in front of the church.

"Oh, Mr. Ivanitza," they cried, "have you seen them?"

"Who?"

"The voters. There are three thousand peasants alone. We've been giving them the ballots. Everything is going on fine. Let's go on to the school."

They passed along a narrow street and entered the polling place. A crowd of voters were assembled and were quietly talking in the courtyard and in the adjoining street. The polling booth was already established in one of the school rooms. The voting began.

But one thing seemed strange to Gramatikov. Near the school yard and in the yards on the opposite side of the street were a number of gendarmes, among whom two sergeants were circulating and whispering. Did not the election laws forbid the gendarmes to assemble within a certain distance from the polling booths? Strange.

He had hardly had time to formulate these thoughts when he saw Dontcho Kokosharin arrive in breathless haste and whisper into the ear of one of the sergeants. The sergeant called a gendarme and sent him off on the run. The prefect came. Kokosharin whispered in his ear. The prefect gave a few orders to the sergeants; a few moments later gendarmes emerged from the neighboring yards leading horses. The prefect drew his sword and twenty mounted gendarmes swept into the narrow

street and began hustling the crowd of voters with their horses' breasts. There were shouts, protests, commands, the guns were drawn, sabres glistened in the early sunlight, the crowds swayed. More mounted gendarmes joined in the melee and the crowd began to give way. The Turkish voters fled. The street began to clear. Only the crowd in the school courtyard remained.

Then from down a side street came the squeaking of a clarionet, intermingling with the sounds of fiddles. There rose the murmur and roar of an approaching multitude, first the musicians, then behind them, Bie Ganio, his eyes flashing with the light of battle. Leading the crowd came Goocholu, Doocholu and Petresk, the nephew of Danko Hersisin and Spiro Kopoya and Topal Mustafa. Followed the gipsies, the hamalin, the fishermen and then Danko Hersisin himself.

"Hurrah for a respectable government!" shouted Danko's nephew, in a thin voice. "Hurrah! Hurrah!" roared the mob behind him. To Gramatikov's mind came the scenes of 1876. He thought of the hordes of bashi-bazouks and the name of Fasli Pasha came to his lips. The wild horde of drunken outcasts came streaming into the courtyard. Bie Ganio, leading his gang, which opened the way for him roughly, walked up the steps to the polling booth in the school room. He watched from the open window.

Micolo Turnovaleya, the opposition's candidate, was struggling on the steps, defending himself against a ferocious mob. Toward him, like a swooping vulture, came Danko's nephew. He caught hold of his collar and began yelling:

"Hold him! He has insulted the Prince!" Petresk and Danko Hersisin tore down on him and threw him down.

When the gendarmes returned they found Bie Ganio's army hard beset by an army of indignant voters, those who had remained in the courtyard. Petresk, with blood on his face and breast and hands, was crying like a whipped child. It was not his blood, but it would have required a calmer perception than was possible at that moment to determine that. He had cut some of the simple peasants and smeared himself with their blood. Now he climbed a heap of stones and shouted:

"Help! Police! They want to kill me. They stuck their knives into me because I shouted 'Long live the Prince!' "

The police did its part. "Sabres out!" Sabres flashed in the sunlight and whips whistled. A storm of protest arose. The police, aided by Bie Ganio's guerrillas, seized Nicola Turnovalia and his most prominent friends. The mounted gendarmes cleared the courtyard. Gramatikov was carried along the street with the crowd. He could still hear Bie Ganio's voice, shouting from the top of the stairway:

"We, too, have been abroad and we know how to conduct elections! I've been in Belgium."

He could still hear the cries of old Dad Dobre, the poor old dad, beaten and shoved about the street, the tears running down his old wrinkled cheeks either from pain or anger. He was crying, in a broken voice:

"But, Mr. Prefect, I thought—weren't we liberated—I thought we were free—a free country."

A few days later Gramatikov read in the papers a report from Sofia, a copy of a telegram to the Minister of the Interior:

"The elections passed in absolute quiet. The Nationalist candidates, Ganio Balkanski, Filio Goocholu and Tanas Doocholu were elected by a heaping majority. The opposition slumped dismally. As soon as the voters appeared with music their hired gangs disappeared. The whole town was overjoyed and democracy triumphed. Long live His Royal Highness!

"GANIO BALKANSKI."

A January Day

By E. P. Powell

That you can all have such a day in January, I do not say; yet will I set it all down as it was. The sun rose at six o'clock in the morning, and at once looked over the big pines, and down in upon us and our lake, noiselessly; as if to say, To be sure! Are you there yet, and are you yet awake? But we were already out in the garden, hoeing away the sandspurs, that like to grow overnight. And the dew was dropping from the pines in great drops and the smell of the pine knots came down to us out of the chimneys—rolling off the roof.

It is not well to wait for the sun in this land, for you could see that he hated to wake us up; as if he would say, I believe I overslept myself one minute this morning, or possibly two. But really the days are so short one had to be up and doing, and so it was we had been this half hour, that is Harry and I, hoeing our carrots and turnips, and as for myself, I was leaning on my hoe for a moment and looking at the lake, as the sun spoke up.

One's legs should always wake with a feeling that they must be on the go, and that the most absurd thing in the world is a man lying in bed after daylight. Then it belongs to the legs, with a few lively kicks to clear the deck. I have myself a lot of sympathy for boys who are not extremely active at daylight, but very noisy. It is the way of real life. With a few squeals and kicks get into your decencies as soon as possible, and let us find out what the world has been doing behind the dark. It was just that way that we had broken loose, and to tell the truth my legs and arms were already somewhat losing their ambition. Yes, I was leaning on my hoe.

The hens had begun to cackle in the left, or as they passed by, picking bugs, they looked up to us with friendly comments. Shrikes and bluejays in the orange orchard called or sung, or whistled as the whim stirred them. I think you too would have leaned on your hoe, if you could have caught the odor of loquat flowers, that slipped in between other fragrances and begged for attention. Indeed, but it is a curious tree, this loquat, for it does nothing at all but blossom for three or four months before it thinks of fruiting; then all of a sudden it begins to form yellow pears, they have a cherry flavor, and there are loads of them—even if they are afterthoughts. It is one of those fruits that Nature makes up strictly for home use, much like the northern raspberry, for it cannot be shipped, being too delicate for travel. Well, the birds like it, and there will be no waste.

Natal grass, more delicate than any other lawn maker that I have ever seen, with heavy heads of pink, bend over with a weight of infinitesimal dew drops; but the sun seeing it, is thirsty. Coming from South Africa, it refuses to grow at all until the hot days of June, but now it is giving us the second clip in January. The Lyon bean, another of the wonders among our new plant creations, begins to brown its leaves, and its clusters, that swing heavily two feet long, are beginning to ripen. It is January for sure, and somewhere away to the North there are banks of snow that may cover Christmas roses, but here chrysanthemums have not quite tired, lifting their faces sunward; and roses are displaying a full bloom of gold and crimson. Liberty and Gloire de Lyon compare their crimson and scarlet petals, and Marechal Neil overloads itself with golden buds and flowers.

It is orange season, and the earlier sorts, like Parson Brown and Satsuma are already gone and now the Rubys with the magnificent Duncan grape fruit, are being gathered, by singing bands of colored folk, all happy as they enter the groves. A

few later persimmons draw us aside to discuss Tani Nashis instead of the creams and candies offered by our northern confectioners. Mellow and sweet like custard, large as a Bellflower apple, such are these Gustatas and Tani Nashis; more miracles. We had gone to the swing under the willow oak, and as we sat there thinking much of evolution, we sipped our vegetable cream. Mother Nature is very generous, and said not a word to us about the hoe; but she laughed when she heard the breakfast call, and saw us startle with the fact that this is a world of compensations.

In Florida one can easily revert to the wild; eating only fruit and honey and nuts; and why not? It would be bad for the vendors of drugs, but have we not got a little too far with our civilization when it becomes the bond servant of the Texas steer? And there is one State at least that refuses to protect the robin as he flies over her soil because the worms that he eats are New England worms.

It is just eight o'clock. I know it not by any sun dial, but surer than this, by the passing of Currie to the turpentine woods. He is surer than any town clock, and is the fleetest on foot of any black man I ever saw. He carries a gun always, which he never fires along my property, for he knows that even Bob White must not be scared hereabouts. It is a great lesson to teach folk that the birds have rights of their own. Yet that gun is a part of a man, and I would not know them, for a certainty, apart; and behind him trots the slimmest of brown boys. He has to trot, for no boy's legs could otherwise keep up with Currie.

With gun at the same angle always, and himself at the same pace exactly, and the thin boy loping at ten feet behind, this is one of the "white man's burdens." I do not see any white man competing. He is bound for the turpentine woods, altogether a three-mile walk; and when he gets there his voice will ring out to the world as clear and resonant as Caruso; and it will come back to me, bearing to my ears the orders that he gives to his scattered workers. I have never heard anything finer; singing down the avenues of pines; a wireless telegraph ringing thru three or four miles around.

So the hours slip away while the sun is climbing the sky, and in all the clearings around, where the orange groves are half hidden, the orange boxes are filling and piling, ready for shipment. Midday and midnight are opposite poles; each the center of two spheres of life. Midday is dry and snapping with human purpose. Midnight is sprinkled with dew and the music of a million crickets signs you to slumber. Each has its own flowers, and its own odors, and its own life. On my desk there are two vases. In one of them are roses, in the other honeysuckles. The General Jacks and Jubilees greet the day, and invite the butterfly with wary perfume. The honeysuckle, which has no sweetness at noon, at night gives out its whole soul in fragrance to the moths.

Do you know what a southern afternoon can be quietly introvertive —not a thought of the world at large —just sunny and quiet and full of peace? One Gainsboro rose, with over a hundred buds and blossoms, swings into my veranda, and shakes perfume out of its petals of pearl pink. A long row of Ponderosa lemons, loaded alike with fruit and flowers, flanks the veranda to the South. So heavy is the fruit that the soft Gulf breeze barely stirs it on the limbs.

The lake that fills all the forefront is literally covered with ducks. We never allow them to be disturbed with firearms, and here they feel that they have a safe retreat, and so it is with the Bob Whites around the margin. The air is full everywhere of quiet fun. Everyone (and there are hundreds of them) flaps the water, reaches up her neck with a cronk of gossip, and then indulges in games that are quite as complex as those of school boys. As they are all black ducks we see them more readily by

the wake that follows a swimmer, or by the flash of light that follows a diver.

After all, this is a world of play, and the one universal instinct that covers animal and man alike, and every bird and butterfly as well, is sport. Your civic playgrounds and your rural schools in gardens are all one, meeting the universal demand. Yet I never saw or heard anything like this frolic of the ducks before; unless it was when, as a small boy, I was allowed to enter the room where the sewing society met. There was found just the same incessant talk and action. I do not see, however, that the ducks have a committee, or any officer, of any sort, for the quacking is curiously musical and harmonious. Those sewing societies were just that way; each one talked as anybody liked, but was balmily unruffled if no one listened.

Nature study is the effort to see twice as much, hear twice as much, and so be able to judge twice as well concerning the world about us, ducks included. It is just the old advice of the best of countrylife teachers. "He that hath eyes to see let him see," that is, let him look, and look sharp. "He that hath ears to hear let him hear," and he will hear some charming things, and get good advice where he did not expect it. Then follows the open mind, and the open disposition to be broadened out by all that we hear and see. This is the real creation that is going on all the time, that which ends in the making of men and women.

So goes the afternon of a January day in Florida. I do not say whether we are taking home fish for supper, or not. If not, there is all the more happiness where the perch and the bass are playing down out of sight of inquisitive man. At four o'clock the sun is shining, but at five o'clock it is dark. Then from five till seven are two hours that are largely lost. Even the crackle of the pine knots that we have kindled in the fireplace, do not satisfy one who has not worked out a decent day's stunt. It takes at least ten hours for a square built soul to get through a comfortable day's job. I have no sympathy with those who are constantly crying for a shorter day's work; eight hours; seven hours; and when will they be satisfied? It is such a little snip of achievement that one can get through with at the best on one of these short days. I would rather be up at four in the morning, and close at seven at night—earning a noonday's swing in the hammock.

Yet this is wonderful to sit before a pile of pine knots, that Nature was two hundred years in the making, and see the undoing of it all inside of two hours. A thousand voices crackle and croon in the pile. I imagine they are telling some of their experience in the wild old days, before axes were heard hereabout and fireplaces were built. It is a phonograph of Nature's speech, that some way got into these old pine trees; the music of the winds and the growing pains of the limbs that were trying to climb eighty feet sunward. Some time ago I sat in a dealer's parlor, and he opened a Victrola; then another, and another; and I heard the flute of one musician, the violin of another, and the voice of a third. So are the voices that the flame lets loose from these old knots. It is my Victor Victrola, full of wilderness songs and the flutes of centuries.

Country life lost its hold on the family when it gave up the fireplace. The rallying room of the old days was the kitchen, and it was around the hearth stone. It was there where the altar was reared twice a day, and God was invited to be the Father of the fold. The modern country house has no substitutes. It has no place where one warms his feet and his heart at the same time. If you build a home in the country be sure to have at least one big fireplace. Make it open with welcome, where you can pile huge sticks of hickory, or of maple, or of pine, and have unstinted flame. You need not welcome me with words in a room from which the family religion and unity have gone out.

This was the way of it, and this is the way January conducts itself here, where no boy ever slid down hill, and where not one day is ever lost to the industrious gardener. It will be cabbages in January, celery in February, carrots and lettuce all the while; and rarely a day when you may not have a bunch of roses. Does Nature therefore give to us everything out of hand? Assuredly not. You will find that nowhere is the labor law of the Fourth Commandment more strictly enforced; "Six days shalt thou labor, and do all thy work." The farmer must know what humus is, and how to make it in winter as well as in summer. He must understand summer cover crops instead of winter cover crops. He must know how to think where Nature is jogging him at the elbow constantly, altho fools may claim his ears. In New England winter is a rest period, but not so here. Things are growing all the time, altho the deciduous trees drop off their leaves for a couple of months. But if you hunt for Florida in the Everglades; well, I advise you to turn aside to the hills and the lakes.

Sorrento, Florida.

Protecting the Indian

By Grant Foreman

[All who have at heart the welfare of the Indians or the good name of our country for fair dealing should become acquainted with the facts brought out in this article in regard to the bearing of the Indian Appropriation Bill, now pending before Congress, upon the Oklahoma Indians.—EDITOR.]

Oklahoma became a State on November 16, 1907, with 1,500,000 population. Included within the borders of that State were over 100,000 Indians who only a few years ago owned every foot of that fertile domain, known as Indian Territory, secured to them by the solemn grant and covenants of our government. Oklahoma is an Indian word said to mean, "the home of the red man." The overwhelming of this Indian home by white people and its transformation into a white man's State of the Union are sufficient evidence of the fertile soil, salubrious climate and vast wealth of natural resources within this domain; a condition that thruout all our history has been regarded as justification for plundering the Indian of any land wanted by the white man.

In the very nature of things the white man's view of progress and prosperity in Oklahoma is incompatible with the Indian's enjoyment of the rights vested in him by treaties with the government. While framing legislation looking to the erection of a State upon this land, Congress undertook to establish safeguards for protection of the Indians in their new relations. In the treaties of 1898, 1901 and 1902 provisions were made to allot all these lands to the individual Indians. Having in mind their inexperience and improvidence, restrictions upon the sale of their lands were imposed in various measures. After the lapse of a fixed number of years the degree of blood was to test the Indians' capacity for making provident sales. A homestead was reserved out of each allotment which could not be sold for 21 years. As a further protection and in consideration of the Indian's agreement to the allotment of the land, certain tax exemptions were reserved to the Indian on all or part of his allotment for a limited period of time.

Not long after these agreements were made with the Indians the white people, whose presence here was a violation of a score of solemn but empty promises made by our government, discovered that these provisions made for the Indians' protection did not meet with their approval. From that time to this the

white man has waged a tireless contest to remove every measure of Indian protection that seems to stand in his way. Yielding to this pressure, restrictions against the sale of the Indians' land have been destroyed by Congress, that certain classes of Indians might be turned loose and permitted to sell their land without the counsel and protection of the Interior Department. Tax exemptions were attempted to be destroyed by another act of Congress. (May 27, 1908, 35 Stat. L, 312.)

Eight members of the House of Congress were recently elected in Oklahoma. If Oklahoma public sentiment constitutes their platform, then they are committed to the removal of all remaining restrictions on the sale of Indian land in Oklahoma and the "emancipation of eastern Oklahoma from Federal control." Since Oklahoma was first represented in Congress it has been urged that the Indian situation here should be given over to the care of the State, and that local authority could be trusted to give the Indians all the protection they need. In response to this demand Congress passed an act on May 27, 1908, declaring the status of the Indian in Oklahoma and removing the restrictions on the sale of over nine million acres of their land. This act also committed to the probate courts of Oklahoma full and complete jurisdiction over the persons and property of all minors of the Five Civilized Tribes who previously were under the protection and control of the Federal Government.

For the reason that the interests of the white people of the State of Oklahoma have nothing in common with the welfare of the Indian, the latter has but little aid in point of numbers in his unequal contest. But what he has lacked in numbers in a large measure has been compensated by the intelligence and vigor with which his cause has been championed in certain quarters. In May, 1904, President Roosevelt commissioned Mr. M. L. Mott of North Carolina to act as National Attorney for the Creek Tribe of Indians. His native State was an early witness of the perfidy of our government to the Five Civilized Tribes of Indians and that dark chapter of history made a deep impression upon Mr. Mott who has long cherished the hope of fair play if not of atonement to these unfortunate people.

Imbued with a high sense of the responsibility of our government to the weak and defenseless Indians, Mr. Mott has engaged the hostility of the white people of Oklahoma by performing lasting services of inestimable value to these wards of the government. The bringing of a large number of suits to recover for the Indians lands platted into town lots and illegally held by white people involved large property interests and engendered bitter feeling against him. Thru his efforts a measure was enacted by Congress in 1906 extending for twenty-five years the restrictions against the sale of lands of full-blood Indians of the Five Civilized Tribes, and he afterward defended this act from the assaults of land-buyers clear to the United States Supreme Court. (Marchie Tiger case 221 U. S. 286.) Afterward he formulated a line of defense for the Creek Indians and presented it to this same court in resisting the attempted destruction of their tax exemptions. (English v. Richardson 224 U. S. 680.) In both of these controversies Mr. Mott and the Indians were successful, thereby securing property rights to these Indians to be measured in the millions. The result of his efforts paved the way for the bringing of suits by the government involving 30,000 causes of action against white people for the canceling of deeds improvidently made by full-blood Indians, the most of which have been settled favorably to the Indians. The activities of Mr. Mott resulted in establishing in our courts and in the policy of government, rights and principles that shall belong to the history of the American Indian and that only the future can correctly appraise.

In opposing persistent efforts to withdraw Federal supervision and protection of these people and deliver them into the hands of State authority, Mr. Mott has contended that the Indians' interest cannot properly and adequately be protected when administered in tribunals subject entirely to local environment and influence. This well recognized fact from the beginning has been the ground upon which Federal jurisdiction has been maintained over the Indian and his affairs. It has been recogninzed by the Supreme Court of the United States from the time of Chief Justice Marshall down to the present day and this observation applies regardless of the locality or State in which the affairs are administered. Mr. Mott contended against the claim that the State of Oklahoma could be trusted to carry out the treaty agreements with the Indians, and in 1908 he tried in vain to convince the Indian Committee of the House that the Federal Government should retain supervision for a while over the estates of minor allottees of the Five Tribes.

If history has not sufficiently justified his contention Mr. Mott has exposed the fallacy of his opponents by a most astonishing argument. He has just filed with the Interior Department a report upon an investigation made by him of the administration since Statehood of minor Indian estates in the Probate Courts of the eight counties of Oklahoma comprising what was formerly the Creek Nation. The *Congressional Record* of December 13, 1912, which contains this report in full, is referred to as authority for the statements that follow.

The report shows that in the eight counties mentioned there appear on the dockets of the Probate Courts 7396 estates of minors of over one year's standing. In over 4000 of those cases complete data were not available because of missing files or because guardian's reports had not been made, so that investigation was limited to the remaining 3057 cases. These cases were divided by Mr. Mott into three classes; first, cases in which the administration has been in the hands of incompetent relatives or professional guardians (by which is meant a class of persons who make acting as guardians a business to a considerable extent); second, where the administration has been in the hands of competent relatives or business men; and third, for the purpose of comparison, the guardianships in cases where white minors only are involved. There are 2320 cases of the first class, 534 cases of the second and 203 estates of white minors.

It appears from the report that in the 2320 cases of professional or incompetent guardianships, the guardians have handled $3,896,693 belonging to their wards, at a total cost allowed by the courts of $763,483, or 19.3 per cent. of the funds handled. This enormous expense was made up of $346,095 for attorneys' fees, $138,205 for court costs and $279,182 for guardians' fees. In most cases, it is said, these expenses were for services in connection with the sale of the lands of these Indian children, and the necessary inference is that allowances against funds so derived permanently deplete their estates. This results in defeating the avowed purpose of judicial supervision, the conservation of the estates. In addition, it is said that extravagant and unwarranted allowances for maintenance and personal expenses of the wards have been made, improvident loans of the wards' money have been authorized and in many instances the bondsmen of the guardians are totally insolvent.

Comparison with the other classes is most significant. In the 534 cases of competent guardianships $1,346,523 was handled at a cost of but $53,030 or 3.1 per cent. of the whole. In the class of 203 white minors $328,536 was handled at a cost of $7755, or 2.3 per cent. of the whole.

The figures show that in the first class the funds handled averaged $1680, in the second class $2521, and in the white class $1120. It cost each

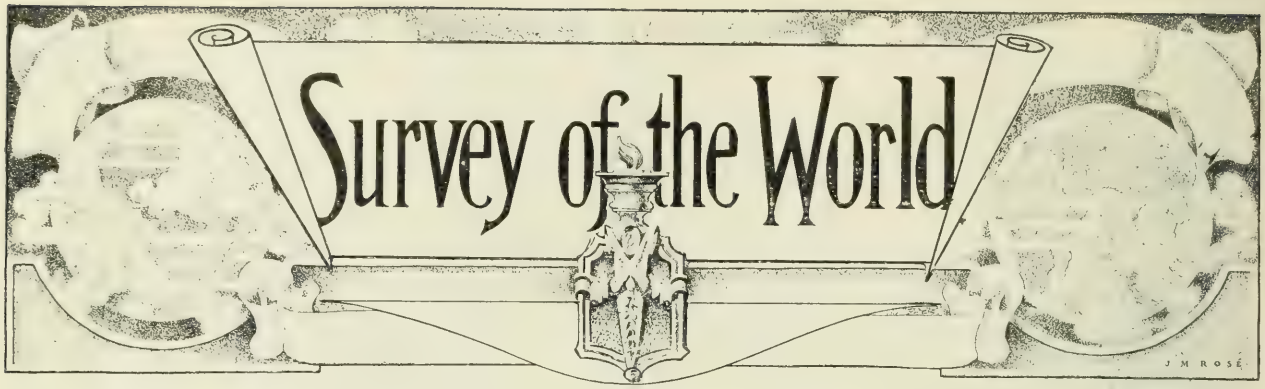
ward of the professional or incompetent guardian $336 for expenses allowed by the court, as against $78 assessed against the more fortunate ward of a guardian of the second class where nearly twice as much money was handled. The white minor's estate was administered by the same court at a cost of less than $26.

It appears from the report that conditions are substantially the same in all the eight counties, the cost of administration of the first and largest class of estates ranging from the lowest average cost of 18.2 per cent. in one county to the highest average of 24.5 per cent. in another. By way of illustrating the points made, many individual cases are mentioned where the funds handled ran from one thousand to three thousand dollars, and the expense of administration amounted to from 25 to 45 per cent. and some of them were as high as 50 and 60 per cent. and even higher. Many estates received five to ten thousand dollars and some several times the last figure and the percentage of expense was from 16 to 25 and even 35, 50, 70 and 73 per cent. was attained.

Mr. Mott filed with his report a transcript of all the 3057 cases referred to, in eight volumes—one for each county. He filed also as an exhibit a set of reports obtained by him from Probate Courts of thirty States of the Union from which it appears that the average cost of administration in those courts of minor estates does not exceed 3 per cent. of the funds handled; this is about the same as for the administration of white minor estates in Oklahoma and just a trifle less than that of the fortunate Indians placed by Mr. Mott in the second class.

As this is the only report that has ever been made of the administration of the affairs of any of the Five Civilized Tribes under the jurisdiction given the Oklahoma Courts in the Act of 1908, there is no apparent reason to suppose that conditions are any different in the other tribes from that of the Creeks. On December 13th, the day after copies of this report were furnished by the Secretary of the Interior to members of the House committee on Indian affairs, while it was under discussion Mr. Mott was characterized on the floor of the House as a carpetbagger by members of the Oklahoma delegation. Tho this evidence of their hostility was merely cumulative to that already shown, it was doubtless welcomed by Mr Mott for its pertinency to the case he was trying to make before that body.

Mr. Mott has thrown a strong light on a most important subject for the inspection of Congress and the Nation. Our stewardship of these helpless people is challenged in a manner that cannot be ignored. If 84 out of each hundred of these wards of the Courts, the most helpless ones, are assessed 19.3 per cent. of the amounts handled, while the other 16, more fortunately represented, escape with 3.1 per cent. and the white child with 2.3 per cent. as is claimed by this report, it states a situation that merits the gravest concern. It charges such an apparently unjust discrimination against these people and extravagant administration of their affairs as to call for careful investigation by our law makers.



The situation is employed by Mr. Mott not only with reference to the facts reported, but also to illuminate the whole project being urged before Congress, of surrendering the supervision of these people now exercised by the Federal Government. After pondering this report one cannot escape the conclusion that unless the facts claimed can be disproved another strong argument is established calling for an alert supervision of these Indians by a disinterested Federal Government for years to come.

Muskogee, Okla.

THE LETTER HE SENT HOME: "Dear Folks—I should like to have spent New Year's with you down in the country, but CONDITIONS here were such that I had to stay on and attend to my duties with the *city government*."

The Milk Question

That there is a milk question is one of the facts of domestic life, and too often it is a lamentable fact. It was Josh Billings, or some other of the group of professional humorists flourishing at that time, who had a lecture on "Milk," but said nothing about milk except that "the best thing on milk is cream." Back as far as that there was no milk question. It has become acute within the past few years. The milk bottle for delivery of milk to individual takers has come into general use within the past fifteen years. Since about that time it has become one of the most interesting and important of those questions of public health which have been so thoroly "threshed out."

The secret of milk is revealed in an almost unconsidered circumstance; it was never meant to see the light. That is all the trouble with milk—nearly all of the milk question. Nature meant that milk should go direct from the body that produces it into the body that needs it for nourishment. That it does not take that course, but is exposed to the baleful influence of the atmosphere and all that therein is has created the milk question. Perhaps we have not thought about this seriously enough, and considered the milk question from the point of view thus suggested. We have all these years been trying to do an unnatural thing, without considering that it is unnatural. Of course we have failed. In the good old times, when we all lived in the country, or when there was no objection to the keeping of cows north of Canal street, we got our milk so close to its fount that we were not visited with the ills we now so complainingly endure. Or, perhaps we were visited with those ills but did not know from whence they came. We never used to have appendicitis. We had inflammation of the bowels, and died of it, without knowing about the small and useless organ they now so deftly remove. We used to have fevers of sundry kinds we never now hear of, and they removed us with great facility. We did not know what ailed us, nor why. Now we trace nearly every ill to some particular bacilli, and we go after those bacilli. So milk has come within the pale of our biological perception, and we are but just realizing that we have a task of extraordinary difficulty and delicacy to placate Nature and get her to agree to the breaking of her laws.

When we did not try to transport milk such distances, but usually used it, in its raw state, when freshly milked, there was not so much of a milk question. If now we were able to have milk delivered to us before it is many hours old, there would not be much of a milk question. But we cannot hope for that. So we have got to do the best we can to produce milk nearer the consumer and get it to him quicker and in better condition. We have been too drastic in driving the cows away from the cities. They can be kept near cities without being either a menace to health or a nuisance. There's land enough within 50 miles of New York for all the cow plants needed to furnish the city with milk. There is land enough within 40 miles of Boston to serve for sanitary homes for cows enough to produce all the milk that city needs. So of other cities. This is a fascinating subject, and perfectly susceptible of believable elaboration, but space permits only of mention here. We invite our friends of the farm press to take it up.

But it will take time to overcome fear of the honest cow as a neighbor, so we must think of some other device to help us overcome Nature's repugnance of the usual milk transportation and distribution processes. It comes to the cities with reasonable speed —sometimes, but not always. It is not at all unusual for contractors to lose whole carloads in consequence of neglect by the railroads. But when it gets to the cities the muddle begins. It is parceled to innumerable distributing teams, and they go haphazard into all parts of the cities. It is always possible to find half a dozen, or more, wagons in one short street. If the contractors would agree upon some sane plan for delivering their milk it would help. Why is it not quite reasonable to require that each wagon shall have a route and deliver all the milk on that route? It would not be necessary to deliver one kind of milk only. The wagon could take the kinds of milk the people want: If in Boston, so many quarts of Hood's, so many of Whiting's, so many of Alden's, and so on. It is perfectly feasible. Some groups of department stores deliver their goods thru a clearance company that sends one wagon only into a locality, loaded with the packages from half a dozen stores.

Prof. Rosenau says in his recent admirable book,* that "The cost of distribution is more than the price of milk plus the cost of bringing it to the city." I have not figures at hand to satisfy myself upon this point, but think the statement must be taken as relative. If it were literally true, we would have to pay more than nine or ten cents a quart for our milk at our doors. But the cost of distribution is very large—very much larger than it should be. The simple expedient of cooperation among the distributing concerns would not only lower the cost but promote speed—save time, which means better milk. Our author is a bit hazy on the question of farmer cost. He uses the figures of the Census of 1900. Much has happened to the price of milk since then, and it would have been easy for him to have got the figures for 1912, which must be in the neighborhood of double those of twelve years ago; certainly for all considerable cities more than double that old average. The professor deals with the whole contractor question somewhat delicately, and assumes much that would make the knowing smile.

The New Governor of New York

Governor Dix having been rejected, William Sulzer, now a member of Congress, was nominated for Governor of New York on October 3 by the Democrats at Syracuse, in what was called "an unbiased convention," the Tammany leader having declined to indicate his choice. Mr. Sulzer, who takes the Governor's office on January 1, was born on a farm near Elizabeth, N. J., March 18, 1863. His father, a German patriot and a Presbyterian, was a friend of General Sigel and Carl Schurz. His mother was of Scotch-Irish and Dutch ancestry. The boy attended the public schools, studied law in a law office and at the Columbia Law School, and was admitted to the bar in 1884. In that year, at the age of 21, he went on the stump for Grover Cleveland. Then and in the following four years he so commended himself to the people that in 1889 he was elected to the Legislature. In 1893 he was Speaker of the New York Assembly or House. Beginning in 1894, he has been a Representative in Congress continuously from the Tenth District, in New York City's East Side. In one election he was successful in spite of the opposition of Tammany. He has been a delegate to the last five national conventions of his party. Up to the present time he has been chairman of the House Committee on Foreign Affairs. Governor Wilson says that in this office he has shown "capacity and discretion of a very fine sort." He has enjoyed the confidence of President Taft, whose Mexican policy he has upheld. He has proposed and promoted much legislation. His friends say he has been mainly responsible for a new copyright law, increased pay for letter carriers, the bill creating the Bureau of Corporations, the resolution abrogating our treaty with Russia because of the treatment of Jewish citizens bearing

THE GOVERNOR OF NEW YORK.

Who was until last month a Representative of his State in Congress. This portrait of William Sulzer is one of the most conspicuous paintings on exhibition at the National Academy in New York City.

*_The Milk Question_, by M. J. Rosenau Professor of Medicine and Hygiene, Harvard Medical School, etc., Boston; Houghton, Mifflin Company, $2.

American passports, and the bills for the Lincoln's birthday and Columbus holidays. He has also proposed and supported bills for an income tax; postal savings banks, the parcels post, direct election of Senators, a Department of Labor, and tariff revision. In 1908 he married Miss Clara Rodelheim, of Philadelphia and New York, who had been a trained nurse. "As Governor of New York," he said a few days ago, "I shall to the best of my ability endeavor to give the people of the State an honest, an efficient, an economical and a businesslike administration of public affairs. Business men can rely upon me to do my utmost to promote commercial interests. I shall be careful not to jeopardize the financial supremacy of the first city and first State in the Union." He points to his record in the Legislature and in Congress. He is confident that he has made no enemies, except those who are enemies of the people. He will take office, he says, with no one to punish, no grievance to satisfy. Seeking simplicity and economy, he decided that the customary elaborate military parade should be omitted at his inauguration. The portrait of Governor Sulzer reproduced on page 45 was painted by the young New York artist, Leo Mielziner. It is a striking canvas, fully life-size, and the pose has been described as that of "awkward sincerity." It had been stated that the portrait will be offered to the Metropolitan Museum of Art in New York.

A Prize Painting

At the Winter Exhibition of the National Academy in New York the Carnegie prize of $500, for the most meritorious oil painting by an American artist, portraits only excepted, goes to E. Irving Couse for his "Indian Making Pottery." This annual prize has been awarded in earlier years to John W. Alexander, President of the National Academy (his contribution this year is entitled "A Meadow Flower"); J. Francis Murphy; Douglas Volk; Charles C. Curran; Louis Loeb; Childe Hassam; W. T. Smedley; H. B. Fuller; Gardner Symons; W. S. Robinson, and E. H. Blashfield. It is interesting to note that every one of these painters is a resident of New York city. The composition by Mr. Couse (an Associate of the National Academy) is reproduced with this report of the award; as is the striking portrait of the new Governor of New York. This exhibition of over 500 paintings and sculptures will be open to the public until January 12, at the galleries of the Academy, 215 West 57th street, New York. The show is not a brilliant one—measuring up, however, to the general average of undistinguished efficiency attained in earlier years.

E. IRVING COUSE'S PRIZE PAINTING, "MAKING POTTERY."

Can You Answer These Questions?

Two private schools—one of them the De Lancey School in Philadelphia, the other the Nichols School in Buffalo—hold an annual examination such as other preparatory schools, and high schools, too, would do well to install. In general there are too many examinations, not too few: but the one referred to is different from the rest in stimulating and rewarding *intelligence* as opposed to diligence alone. There is no preparation for it, and no warning; and it does not search into any particular class-work, but only into the general information of the school boys, without reference to the sources of their information. Class-work, book-learning, newspaper reading, home-conversation, individual interests, curiosity and retentiveness of the young mind; these are all tested. And after the boys have wrestled with these unexpected questions, the best-rounded of them receive prizes of such books as they would naturally enjoy: the best informed of the younger and of the older boys standing forth from the mass of their fellows to receive this little distinction. How many of the following questions put in the De Lancey School general information test of the school year 1912-1913 can be answered without recourse to the encyclopedia by your pupils, by your sons and daughters, or even, dear reader, by yourself?

GENERAL INFORMATION TEST.

I

1 Name three of the political parties in the recent national election.
2 Name the President-elect and the Vice-President-elect.
3 How many electoral votes has Pennsylvania?
4 In the event of the death of the President and Vice-President, who acts as President?
5 Name the President of Mexico.
6 Name the President-elect of Cuba.
7 Name the engineer in charge of the Panama Canal.
8 Name the President of Princeton College.
9 Name the Archbishop of the Philadelphia Diocese.
10 Name the Director of Public Safety, Philadelphia.
11 Designate the chief allies in the war against Turkey.

II

Mention some event of recent or current interest associated with each of the following:

12 Dr. Sun Yat Sen. 13 Nogi. 14 Nicaragua. 15 Clarence Darrow. 16 Felix Diaz. 17 Billy Rugh, of Gary. 18 Jane Addams. 19 Adrianople. 20 Amundsen. 21 Thorpe, of Carlisle. 22 Dr. Ellis P. Oberholtzer. 23 Sir William Ramsay.

III

24 What is an artery?
25 What is a vein?
26 What are the emergency directions for a severed vein?
27 What are the emergency directions for a severed artery?
28 Name a common remedy for burns.
29 What is the normal temperature of the body?
30 What is the number of cubic inches in a gallon?
31 What is a meridian?
32 What is a parallel of latitude?
33 What is the latitude of Philadelphia?
34 Name some place in Europe of corresponding latitude.
35 What is the letter postage to Great Britain?
36 Explain these abbreviations: R. F. D.; C. O. D.; F. O. B.; R. S. V. P.
37 What three colors (signal lights) is a boat required to display at night?
38 What tack (in sailing) gives the right of way?
39 What are two advantages of the keel for a sailboat?
40 What car won the recent Vanderbilt Cup race?
41 What is the speed record for the hydroplane?
42 Why is a hydroplane faster than a displacement boat?
43 How many leaves to a stem has poison ivy? How many has Virginia Creeper?
44 Give an example of a powerful alkali.
45 What is the normal rate at which sound travels?
46 What is the best material for conducting electricity?
47 What is meant by the term, "harvest moon"?
48 Name three of the chief products of the southern States.
49 What State produces the most corn?
50 What State mines the most coal?
51 What is the value (in United States money) of a franc?
52 What is the farthest western city with which one can talk by 'phone from Philadelphia?
53 What is the height of the tide in Delaware Bay?
54 What is meant by a baritone voice?

IV

55 Who was the Shepherd King of Israel?
56 Who said, "Whither thou goest, I will go; and where thou lodgest, I will lodge"?
57 What is the meaning of the word Gospel?
58 What was the Promised Land?
59 Who was the greatest Trojan leader?
60 Who defended Thermopylæ against the Persians?
61 Who was the greatest Greek orator?
62 Who sent the message, "I came, I saw, I conquered"?

63 Who won at Actium?
64 Who founded the faith of Islam?
65 Who was called "The Scourge of God"?

V

In what way was each of these persons famous? Refer, when possible, to some special achievement (in art, literature, science, mechanical progress, exploit in war, or statesmanship):

66 Michael Angelo. 67 Galileo. 68 Robert Bruce. 69 Jenner. 70 Beethoven. 71 Watt. 72 Rembrandt. 73 Lord Nelson. 74 Bismarck. 75 Florence Nightingale. 76 Tolstoi. 77 Henri Pomcare. 78 Cervantes. 79 Gutenberg. 80 Sir Isaac Newton. 81 Cuvier. 82 Schiller. 83 Richelieu. 84 Metternich. 85 Molière. 86 Darwin. 87 Jenny Lind. 88 Cecil Rhodes. 89 Horace Howard Furness.

VI

90 Why is Pennsylvania called the "Keystone State"?
91 What was the "Walking Purchase"?
92 What is the origin of Thanksgiving Day?
93 Who drew up the Declaration of Independence?
94 Who was the first commander of the Continental Army?
95 Why were the "Blue Laws" so called?
96 Who published "Poor Richard's Almanac"?
97 When did the Constitution of the United States go into effect?
98 Who was "Old Hickory"?
99 Who invented the cotton gin?
100 Who invented the telephone?
101 Who was Hiawatha?
102 Who was Daniel Boone?
103 What was the meaning (in American history) of "Fifty-four forty or fight"?
104 Who said, "We have met the enemy and they are ours"?
105 Who were the "carpet-baggers"?
106 What was the Freedman's Bureau?
107 Who were the "Molly Maguires"?
108 Who led the charge of the Virginians at Gettysburg?
109 What was the Civil Rights Bill?
110 Who invented the reaper?
111 Who invented the mimeograph?
112 Who, lashed to the mast, led his ships in the battle of Mobile Bay?
113 Who was the American pioneer in aviation?
114 What President started the work on the Panama Canal?

VII

115 Describe briefly a painting in the Pennsylvania Academy of Fine Arts.
116 Who painted the "Mona Lisa"?
117 Who composed *Parsifal?*
118 Who composed *The Cricket on the Hearth* (opera)?

VIII

Name a work of each of these authors:

119 Milton. 120 Scott. 121 Longfellow. 122 Goldsmith. 123 Burns. 124 Hawthorne. 125 Dickens. 126 Tennyson. 127 Stevenson.

Identify by author and work the following quotations:

128 "All the world's a stage,
And all the men and women merely players:"
129 "God's in his heaven—
All's right with the world!"
130 "Mine eyes have seen the glory of the coming of the Lord:"
131 "They sing no more by the glimmer of the moon
On the bench by the old cabin door."
132 "Nail to the mast her holy flag,
Set every threadbare sail,
And give her to the god of storms
The lightning and the gale!"
133 Quote a verse from the Sermon on the Mount.

The Baconian Method Applied to the Psalms

The entire purpose of the Baconians, first devised by Miss Bacon, of New Haven, has been to deprive Shakespeare of all right to credit the world has given him as its greatest genius, and to transfer it to Lord Bacon, who wrote all the Shakespeare plays, but never acknowledged them. He did, however, hide his claim away in certain mystical numbers and covert claims which the adept can discover and recognize. We are very glad to see that the tide is turning and that equally good reason has been found to prove that, beside the plays, Shakespeare wrote the oldest and most famous and popular of all books, the Book of Psalms usually attributed to David. For this fresh and important evidence we are indebted to the *Fortnightly Review,* of St. Louis. To get the mystical number which will be the clue recall that Shakespeare wrote his name in the three following ways, "Shakespeare," "Shakespear," and "Shakspere." The number of vowels is five, four and three. The average, which may be taken as normal, is four. Write down "4." The consonants in any spelling are six. Write down "6" after the "4" and you have "46," which is the mystic key. Now turn in your old Bible to the 46th Psalm, and count the words from the beginning. The 46 is "shake." Next come from the end, and the "46th is spear"—*Shakespear.* What could be more convincing? Let the reader try it for himself, and then disbelieve if he can that Shakespeare purposely hid his name away in the Psalm. No miserable invention of those who would try to filch the fame of Shakespeare is half as conclusive as this which adds to it.

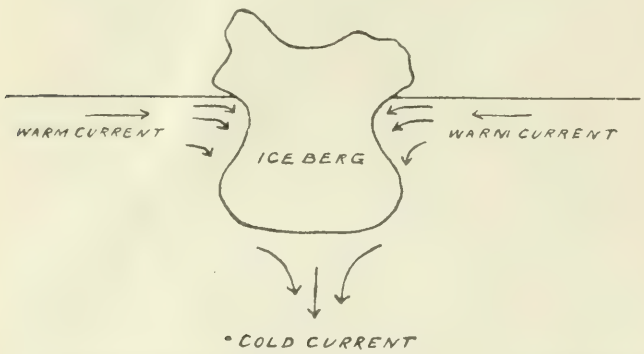
A Big Slice of Turkey

The Turkish delegates spent a bad quarter of an hour at the fifth session of the London Peace Conference on Dec. 23, when the representatives of the four allied powers placed upon the table the terms on which they were willing to make peace. The demands comprised not only all of the territory now held by the Balkan forces, but also important points which they have hitherto failed to capture, for Adrianople still holds out against the Bulgars, Skutari against the Montenegrins and Janina against the Greeks. Only the Serbs have succeeded in getting all that they went after and this is doubtless because there were no strongly fortified towns in the region traversed by their armies.

If the Balkan States have their way the Ottoman empire in Europe will be reduced to the two peninsulas of Tchataldja and Gallipoli, commanding, respectively, the straits of the Bosphorus and the Dardanelles. The western boundary line of the Turkish territory, as the allies wish to draw it, will extend from a point on the Bay of Malatpa, east of Midia on the Black Sea to a point on the Sea of Marmora, east of Rodosto. This is only about fifty miles west of Constantinople and twenty-five miles west of the Tchataldja lines, where the Bulgarian and Turkish forces now rest on their arms in opposing entrenchments during the present armistice. Bulgaria is anxious to get access to the Sea of Marmora at Rodosto, but is willing to concede the Gallipoli peninsula to Turkey. Crete and the Aegean isles are to be given to Greece and Albania become independent.

These terms the Turkish delegates declare preposterous and put forward only for the purpose of breaking off the conference. It remains to be seen how much of an abatement they will be able to secure from the victors in this short and decisive war. If the delegates of the five nations now sitting about the table in the picture gallery of St. James's palace fail to come to an agreement, "there will be trouble in the Balkans in the spring."

How an Iceberg Warms the Water



It has frequently been suggested since the *Titanic* disaster that vessels should be provided with sensitive thermometers in the water which would indicate the near approach to an iceberg by a fall of the mer-

WHAT THE BALKAN STATES DEMAND

The terms of peace proposed by the allies involve the surrender of the shaded area on the above map, that is, the whole of Turkey in Europe except a strip there in black) along the Bosphorus, Dardanelles and Sea of Marmora, which the greater powers prefer should remain in the custody of the Sultan.

cury. Like most such suggestions this takes much for granted. It is based on the assumption that the iceberg floats in a bath of its own meltings and that therefore the water in its vicinity is colder than elsewhere. But when the assumption is put to the test of

CONVECTION CURRENTS DUE TO ICEBERG MELTING

The fresh water from the melting berg is carried downward and warmer water flows in at the surface.

experiment the contrary proves to be the case. Prof. H. T. Barnes, of McGill University, using a steamship placed at his disposal by the Canadian government for experimenting in Hudson's Straits found that the temperature of the water rose nearly two degrees Centigrade as the vessel approached an iceberg from a distance of five miles off. A falling thermometer will indicate a cold current from the north whether it contains icebergs or not, but in the immediate vicinity of the berg the water is warmer. This Professor Barnes explains in *Nature* of Dec. 12 as due to the fact that the water melted from the ice and cooled by it flows downward and warmer water is drawn in from the sides to take its place as indicated in the figure below.

Clutter of Things

Mr. Nichols in his interesting book, *Through Hidden Shensi,* told me last night that in the sleeping-room of the Empress Dowager of China in her palace of exile at Sian there was nothing but a conventional Chinese bed, a bench, and a carpet. I pictured to myself a large room hung in red—or possibly yellow, the favorite color of Tsz' Hi; the walls pictureless and the wainscot furnitureless; the floor uncluttered—the whole just a nice big empty space. I thought, after all, how wise are these old Chinese: they realize how restful it is to have the eye empty, and hence the mind free from things, free to meditate great thoughts—for instance, how to represent in graphic character the soul. General Sieh hundreds of years ago meditated representation of happiness and accomplished it in a queer and wonderful ideograph.

This morning I awoke and found my eyes at once full of Things. I first saw the steam radiator—for its sizzling had roused me—the Chinese heating system is under the flagging; then a very disorderly bookcase (overflow from my study) full of paper-covered volumes, catalogs, clippings. The large mirror of my dresser caught the glow of the rising sun and so drew my gaze. From it my eyes traveled to the top of the dresser, strewn with toilet articles, a bachelor's work-basket, favored photographs. Besides these Things my room contains a bed, a dresser, a washstand, a case of filing-drawers, a trunk; and on the walls are two or three college banners and my "W"—reminders of past glory—a water-color of an amatory nature, and a girly poster. I sighed as I thought of Tsz' Hi's room; wished for rest; rolled over; and resolutely closed my eyes.

Friends of mine have in their living-room about sixty square feet of picture space, cut up into small spaces by three doors and three windows; in these spaces they have managed to hang nine pictures—three enlarged photographs of landscapes, two color-prints, a water-color, and three steel engravings of cathedrals. They have about the same wainscot wall space; this is taken up by a divan, two sets of book-shelves, a combination book-case and writing-desk, a stand on which is a chafing-dish, two tabourets, a morris-chair, and a beautiful low stool. When I go to their home and sit in the morris-chair, all these Things seem to me unrestful Beings who stretch out their arms toward me and with big, flat palms push and push. After a few minutes there I feel completely shoved together.

Usually I leave after a short visit—which, because of my affection for these good people, I should like to prolong—and rush to the home of another friend, a home in which I am not bothered by Things. It has a plain, square living-room with a bay window on one side. The walls are covered with a rich green paper which has just the suggestion of a stripe in it. The rug, in harmonizing colors, merely continues under one's feet the walls. The hangings also are green, and hang in simple straight folds. In the recess of the bay window is a tabouret supporting a plain brass bowl with a sword fern in it. As the room is not large there are only three chairs (more can be brought in from elsewhere!). In the center of the room is a mahogany table with nothing on its dull finish top but a drop lamp with a shade of rich color and simple design. Whenever I enter this room I breathe a long sigh, and settle restingly into a leather-covered chair for a worth-while conversation. Here I do not feel shoved together: I feel expansive.

Somehow or other, in the home of my friends of crowded possessions I seldom feel like indulging in anything other than chatter, and, I am ashamed to confess it, gossip. We talk about what happened to us while traveling; how we got the better of

servants who were overly hungry for tips; what grievances we have against Him and Her; how much work we have to do. Most of our talk is inconsequential; some of it is positively naughty; and none of it is either valuable or restful. The Clutter of Things tyrannizes our talk. In the other home, the severely furnished one. I find that my friend and I indulge in quiet, satisfactory conversation that seems to give rest and peace. I cannot for the life of me tell what makes up our conversation—perhaps in that inability lies proof of the worth of it. Anyhow, after my visit I leave this home calmed, refreshed, thoughtful, and rather pleased with myself.

On the mantel-piece of the living-room of a London friend I once counted sixty-seven Things—a pyramidal thermometer in crystal; a tiny pair of *sabots;* a "hunk" of ore from a Rocky Mountain mine; a lacquered Japanese tray, on end against the wall; a miniature marble model of Pisa's leaning tower; a cross-legged Buddha in a grotesquely wave-worn stone that probably came from Brighton; a chunk of coral from India's coral strands; a couch from the far Pacific coast; a small brass bowl richly chased; an ivory match-holder. . . . The room in other details was correspondingly cluttered.

In the *salon* of a Parisian friend, a man of fame among scientists, I found the walls' solid paneling enameled white. This was pleasing. So were the three or four oddly shaped mirrors on them. But the ornaments on the mantel-shelf were many and fussy; the furniture, fussily *Louis Quatorze,* was in profusion; the fussy table ornaments were too many; so were the chandeliers too elaborate and the hearth tools.

And now here I am, sitting at my cluttered desk, amid a vast profusion of Things, writing in praise of the absence of Things. On my desk alone there are three inkstands, a pile or two of books, a few bundles of films, papers, paper-weights. . . . I have in my room five sets of book-shelves and a large revolving book case full of all-sized and many-colored books; a typewriter on a stand; two small tables and a desk; a sofa; two chairs and a morris-chair; a stool; a paper-basket. (The room is nine by fifteen feet.) On the walls—there are really only two legitimate picture spaces—are eleven pictures; and there is a long shelf on one side-wall littered with brass travs, books, tobacco-jar, and a plant. The wall-paper, too—as a finishing touch—is heavily figured. I sit in this room and sigh for simplicity and severity and fewness of Things. To-morrow, if I shall get time, I will do as our Japanese brethren do, hide all Things in closets—secret closets.

Little Kikou, M. Loti tells me in *Madame Chrysanthème,* had many, many Things that she prized, and she was constantly purchasing queer and clever *objets d'art.* All these things she kept hidden. Even a Huntley and Palmer's shining tin biscuit box, which she prized above all else, she kept in a secret cupboard, safe from continual gaze. These Things were too precious to be out to view. The Oriental says, What an indignity to these precious Things to have them out where everybody can see them! What a shame even for myself to see them always! Let us put them aside, and bring them out one by one as affection calls for them. The Westerner says, What a shame to have so many nice Things and not show them! You ought to have them out where everybody can see them. And I add, groaning inwardly, Yes, out where *I* must be constantly seeing them. No, no; the Oriental is surely right: the Chinaman must meditate, so his gaze must not call his thoughts from their channel; the Japanese must only occasionally see Things, for thereby are Things kept warm in the affections. Even one's dearest possessions ought not to be constantly in one's eye; and certainly Things should not be always around in confusion and profusion. Even one's wife or one's husband should not be unfailingly in sight! And what a place one's home would be with all one's relatives (however dear) constantly within one's eye-reach!

When shall *we* learn that Clutter of Things frets, worries, hinders, tires us?

HAROLD G. MERRIAM.

The Dasheen

The world has several times been revolutionized by a new vegetable; by the potato, as it was also by corn. The Department of Agriculture, among its other exceedingly valuable importations, gave us about four years ago the dasheen, which THE INDEPENDENT noted as a probably important addition to our gardens. The hotel keepers of the Southern States begin to report that this tuber is proving to be of more worth than was anticipated. One of them writes that he has placed it on the table for his guests during two winters past, and that, baked or boiled, it has met the decided approval of his patrons, and with not a few it has been decided to be preferable to the Irish potato. Sufficient data are not at hand as yet to determine its comparative yield, but that it is several times greater than that of the common potato is certain. As compared with the sweet potato it not only outyields, but it is much more certain as to its harvesting. The sweet potato, a developed morning-glory, cannot be counted upon by the most skilful growers with certainty. But this we have, a third esculent that may be ranked with the two potatoes, as able to furnish a very large share of the common food of the common people. These three are not exactly rivals, but each one adds to the annual product from which the poor can draw their food. The question of high prices can be permanently attacked only by an increase of our reliable food products. The potato

alone has reached abnormal prices and these are not likely ever to go back to the old level of ten years ago. From another letter: "The dasheen has the advantage of being a good keeper, and there is very little waste while preparing it for the table." The Department of Agriculture is working along the right line and will solve some of our economic problems by enlarging the list of our food products.

A Vindication of the Kingbird

It is an old story that the kingbird, or bee-martin, as he is dubbed in the South, is a wolf among bees. He is so pert and saucy that he looks a very spirit of mischief. He has gone on in silence and let his reputation suffer, save for an occasional protest from some ornithologist, but at last he has been investigated by science. Dr. F. E. L. Beal has examined with tweezers and microscope no less than 665 stomachs sent to the Biological Survey from various parts of the country (not all the birds were killed for this purpose, however), and he tells us that the kingbird is by no means so black as he has been painted, and hereafter may not be shy of displaying his scarlet coronet. Such a critical study was apparently necessary, for

THE KINGBIRD

the testimony from eyesight has been most contradictory. A New-Yorker wrote, for example, that the kingbird would "hover in the air and snap up bees as rapidly as they came within reach." When the bees were swarming, he said, there was danger of losing the queen. He and his neighbors shot every one they could. An Ohio man went so far as to declare he had seen the kingbird "bring its young as soon as they could fly, and stay close to the apiary and feed exclusively on bees." That they are particularly on the watch for bees coming in laden is a constant complaint. Equally observant apiarists, on the other hand, deny any harm of this kind.

So Dr. Beal began to study these stomachs, and their evidence of actual fare, with an unbiased mind. His findings are interesting. About a tenth of the whole food disclosed is vegetable—small wild fruits and seeds. Fully half is made up of beetles, bugs, grasshoppers, flies and caterpillars, the majority being of kinds which include the worst pests to agriculture, such as cotton-boll weevils, asparagus, cucumber and potato beetles, snout-beetles, rose-bugs, squash-bugs, and various more or less harmful caterpillars. One curious fact appears in the bird's predilection for blister-beetles (Meloidæ). "These insects," as Dr. Beal informs us, "contain the drug commonly known as cantharidin, which, besides its property of blistering the skin, produces other peculiar physiological effects when taken internally. It seems hardly credible that a bird could eat without harm an insect that causes a blister when crushed upon the human skin . . . but they were found in 70 stomachs." Perhaps this flycatcher owes to this relish its remarkable liveliness and pugnacity. It seems able and willing to fight anything that flies—goes joyously to battle with crows, chivies, owls and bluejays, and turns the dignity of an eagle into ridicule. The present writer has seen one perched on the back of a big hawk, gleefully urging it to higher and swifter flight. Old John Josselyn's quaint Voyages to New England (1675) puts him down as "a small ash-colored bird . . . that falleth upon crows, mounting up in the air after them, and will beat them till they make them cry." Quite right. Another tidbit is a robber-fly, of which all kingbirds seem especially fond. This is described by one friendly beekeeper as "an insect about three times as large as the bee, which carries off honey-laden bees, kills them, and appropriates the honey. It is a hump-backed, long-tailed, spider-legged monstrosity, of rapid flight, and appears in July and August."

This leads to the main question: what proportion of the 40 per cent. of kingbird food still unaccounted for consisted of useful bees? Of the 665 stomachs examined, honey-bees were found in only 22, which together contained 61 specimens, of which 51 were drones—a percentage almost too small to calculate when one considers the total contents of the 665 stomachs, which Dr. Beal thinks might number fifteen or twenty thousand insects.

From now on, then, let beekeepers save their powder. The bee-martins are doing them far more good than harm, not counting the fun it is to watch them police the bird-neighborhood.

ERNEST INGERSOLL.

Literature

An American Poet

In his *Poems and Ballads* Hermann Hagedorn strikes a true note in a wide variety of song.* From the opening poem, "The Infidel," where the old theme, become so common today, between a faith dead and a faith alive, is treated in the light of a master passion, down to the sharp rebuke of "The Senate's Repudiation of an Honorable Compact," is a wide stretch for the imagination. Between "Laneer" and "The Cobbler of Glamorgan" is an equally wide march of dramatic action. How vivid the picture of the wreck in "Laneer":—

Like a frightened hound the craft shivered. A crashing sea
Broke on the plunging rudder, wrenched it, and wrenched it free.
Into the swirling waters thundered the boom a-lee.

Like straws the hungry deluge swept up over the side.
Fiercely up through the surf we fought. "Laneer?" I cried
Sputtering, gasping, laughing. "Aye, aye, sir!" Laneer replied.

We clung to the knife-like keel. The waters were biting cold,
And up from the windward combers and ever new combers rolled,
And pounded us, tore at us, wrenched us, fighting to loose our hold.

Laneer's flushed cheeks were pale. But she laughed and her eyes were light.
"Why this is a lark to boast of for many a day and night!"

This is dramatic play of passion, with its light and shadow well concentrated. A poem even more to our fancy is that exquisitely graceful "Monna Vita," which carries the French lightness of touch to the treatment of woman as she is treated in America — of woman as she is found in America,—a bit of the coquette and a bit of the "perfect woman nobly planned." With her lover sitting where,

In ancient thickets wonderfully sings
The holy nurse of hearts, the nightingale,
She lends him her hand. "Tell me your guess."
'Tis a Minerva's hand, a woman, hand,
Though from a helmet sprung. Your sire was Jove—
King, wizard, slipper-serf, philanderer, god.
He's dead. *Nous avons changé tout cela*—
And we have better wizards, better gods;
You only stay unchanging. Quiet, now!
Twitch not your hand. Now that I hold it thus
I'll not release it till it tells me all
A hand can tell. A hand! Could I but see
Your eyes! Booh! Hide them, then, who cares? Coquette!

* * * * * *

Somewhat you love your lovers; give, withhold,
As gods and sovereigns may, as women must,
Or lovers will grow bold, and spurn the love.—
Is it to keep the aging ardor warm
You save sometimes your kiss for funerals?

* * * * * *

You love him most who comes
Eager and passionate from the peaks of youth,
Demanding, where the frail one plead; and loves
Though you withhold, undaunted by your scorn,
Knowing that deathless love at last wakes love,
And love awakened will come forth with gifts.

* * * * * *

For him you have no anger and no spite.
You chide, you twinge his ear for some rash word;
For some too hot "I will" you give him tears,
Crush him to raise him higher. And ever yet
He loves, and loves more nobly. For you teach,
As women do, your lovers how to love.
The lust dies in their eyes, the love is born
You wake desire for music in his heart
And answer the desire
I love you thus! Madonna, kiss me now!"

Could there be a prettier wooing, of a finer maid, to a nobler end?

**Poems and Ballads*. By Hermann Hagedorn. Boston: Houghton Mifflin Co. $1.25.

William Sharp and Symbolism

William Sharp (Fiona Macleod) stands as a striking illustration of the fact that no literary movement, however localized it may appear, is ever wholly without its wider extension, corresponding to a mood more or less common to the writers of all countries at a given stage of time and culture and civilization. This point, excellently made by M. Tancrède de Visan in his recent study of modern French Symbolism, *L'Attitude du Lyrisme Contemporain,* receives reinforcement in the issue of Sharp's *Memoir,* by his wife, and *Vistas*—both in the new uniform edition of his work.* The so-called symbolistic movement in literature which started in France in 1885 has by no means been confined to that country. It has made itself felt to a greater or less degree wherever the same influences have been at work, and wherever there has been a revolt against that scientific naturalism which gained ascendency in the art of western Europe towards the middle of the nineteenth century.

These influences are too numerous to be specified here in full, but among them may be mentioned the revival of the Kantian idealism and of German metaphysics generally, together with German poetry of the romantic period, and particularly of Novalis, the theories of the unconscious promulgated by such German psychologists as von Hartmann, the closer study and better understanding of the middle ages, both in its cultivated literary expression and in its body of fables, popular poetry, and primitive folklore, the attention paid to the contemporary literatures of foreign countries, especially the Scandinavian countries and Russia, whose writers in so many instances manifested a purely spiritual inspiration of peculiar intensity; and last, but not least, in place of the Greek influence which played so important a part in the shaping of the earlier romantic mood, the extension of the eastern frontier of European thought towards the mystic and fatalistic religions and philosophies of old Asia.

When the sum of all these influences is duly considered, it will be seen clearly that symbolism is nothing more or less than the latest phase of romanticism, and that the symbolist writers to-day must be closely allied to the great romantics of the early 19th century. There are, of course, differences, for no reaction is ever quite complete, but is always modified to some extent by that against which it reacts—in the present instance by artistic naturalism and the conceptions and methods of modern evolutionary science. Yet these differences remain of degree rather than of kind, and are principally to be detected in the superior subtlety, subjectivity and refinement of expression of the symbolists, who delve more deeply into the soul than their predecessors, and seek to convey, by a more exclusive employment of imaginative suggestion, on the analogy of music, moods more fugitive, and a more obscure range of intuitions and sentiments. To realize this aim they make a wholly new use of traditional literary forms, imposing upon them burdens they were never made to bear before—or at all events after they became fixed by accepted canons of art—and even carry their stylistic refinements to the point of breaking down the old distinctions between prose and poetry for the purpose of acquiring new rhythmical resources.

Maeterlinck, in whom all these phenomena are noted, is regarded today as the modern romantic or symbolist writer par excellence. And so he is perhaps both in point of genius and in the representative character of his work—his early work, more especially—which is touched by nearly all the influences that have shaped the movement as a

**Selected Writings of William Sharp.* Uniform edition arranged by Mrs. William Sharp. Volume 5: *Vistas. The Gupsy Christ and Other Prose Imagininus. Memoir.* By Mrs. William Sharp. Two volumes. 12mo. $1.50 per volume. New York: Duffield and Co.

whole, and contains the most striking illustrations of its technical tendencies—of its peculiar and characteristic methods most successfully employed to the noblest ends. But one man, of his friend and fellow-Belgian, the late Charles van Lerberghe, author of *Les Flaireurs*. Neither the individual significance nor the immediate artistic influence

WILLIAM SHARP

Maeterlinck is by no means an isolated phenomenon, nor is he, as William Sharp pointed out in his preface to *Vistas*, even the originator of much that seems most personal in his art. Indeed, in its framework, this was rather the invention, so far as it can be attributed to any of Maeterlinck should, therefore, be too greatly emphasized in considering the modern movement. Mr. Sharp himself, for example, claimed a large measure of independent inspiration for his *Vistas*. Altho the manner and mood of these little dramas of prose poetry so inevitably suggest

both manner and mood of the Maeterlinck plays the two, *A Northern Night,* and *The Passing of Lilith,* which critics have held to be most completely Maeterlinckian, were written before the author had read *La Princesse Maleine* and *L'Intruse.*

The truth is that, in this instance, as always, the form arrived spontaneously in response to the expressive requirements of a widely distributed state of mind. Sharp was among the first to recognize and hail Maeterlinck, but this was because he had himself already arrived at the same point, if not of art, at least of artistic profession, as the Belgian writer, by pathways of his own. He, too, was a symbolist, but in the main, the product of an independent symbolistic movement in England, which is seldom taken sufficient account of as such, since it is not commonly known by that name. Rossetti, reacting against the mid-Victorian sentimentality of Tennyson, was essentially symbolistic, though we prefer to call him neo-romantic; and the whole major course of English poetry from Rossetti and Morris through Oscar Wilde down to Arthur Symons and Ernest Dowson is at least strongly touched with symbolism; while the work of such a prose writer and critic as Pater was of precisely the character to prepare the way for its appreciation.

Sharp owed much to Pater. He owed something, too, no doubt, to Matthew Arnold in that writer's celebration of the Celtic spirit towards which the magnetic needle of Sharp's own soul, long wavering, at last turned sharply when, by a supreme effort after self-realization, he succeeded in polarizing the two antagonistic elements of his singularly dual nature, and found his own true voice in the voice of Fiona Macleod. In this manner he became, as it were, the neo-Ossianic precursor of the Celtic movement, with much, as Grant Allen wrote, of the "Shadowy Ossianic Spirit," which so fascinated an earlier romantic age, and something, also, as other later Celtic writers have occasionally intimated, of the conscious literary artifice, the rhetorical exaggeration and emphasis, of a Macpherson. There is too a touch of Borrow in Sharp. In fact, he is altogether a very complex personality who is likely to keep biographers with a turn for analysis busy to the end of time, and thus preserve for the curiosity of critical experts, if for no others, a body of work, much of which might otherwise scarcely hope to survive the passing of the present mood of romance which produced it. For such future biographers and analysts, Mrs. Sharp's *Memoir* holds the basic documentary evidence as to the phases of a literary cas psychologique which, even if less puzzling than it has appeared to many ingenuous persons with their fondness for mythical androgynous hypotheses—we remember one in particular by a Miss Lillian Rae was printed in *The Critic* at the time of Sharp's death, and which, we note, finds a place in the bibliography at the back of the *Memoir*—still presents many points of real interest.

Fine Books and "Albums"

Mr. William Aspenwall Bradley's view of the modern illustrated book as less a book than an "album," which was expressed in his article on "Illustrators and Their Recent Work" in THE INDEPENDENT last month, finds support in what Mr. Alfred W. Pollard has to say on the same subject in his work on *Fine Books,* which has just appeared in *The Connoisseur's Library.** Mr. Pollard, who is a member of the British Museum Staff, and a recognized authority, speaks of the poorness of paper and print with which "modern books have too often been handicapped," and intimates "that these are really not *Fine Books*" at all, "but only books with fine pictures in them." And later on, in his introduc-

**Fine Books.* By Alfred W. Pollard. 8vo. New York: G. P. Putnam's Sons. $7.50.

tory chapter on "Collectors and Collecting," he touches upon still another phase of the subject: the perishability of the modern illustrated book brought about by the same causes and by the requirements of elaborate process work. "The new processes," he says, "necessitate the use of heavily loaded papers as a condition of their being even tolerably well printed." But these "loaded," or, as we say, "coated," papers, since they are glazed with a coating of clay, besides presenting a very unpleasant surface to the eye, rapidly disintegrate. Some of the books printed on them "can only be preserved by every plate being backed with sound paper, and a hundred years hence all this illustrated work, much of it really beautiful, which is now being produced in such quantities, very little will remain."

Mr. Pollard suggests that here is a matter to interest some Mæcenas among modern collectors who ought not only to congregate the really well-made books of the past upon his shelves, but to encourage a revival of fine book-making, and especially of fine picture-book-making, in our own day. This, we agree with him, is the only way in which collecting on a great scale can justify itself in the long run, not as mere antiquarianism, but as a stimulus to continued productivity in the fine arts. Such an ideal of collecting was that of Grolier who is, indeed, even better known as a patron of printers and of binders, than as a collector. There is a place for a modern American Grolier in this country at the present moment, and the first thing he would do would be to afford work for those admirable wood-engravers who still survive in considerable numbers, and of whom Mr. Bradley has told in previous articles in THE INDEPENDENT and elsewhere. They are the means through which the crumbling, haphazard, illustrated book of today could be effectively reformed and made once more a thing of permanence and organic beauty. America was once famous for its wood-engraving school, unique in the art of the world, and no country can lay claims to a sound and normal art life which, while cultivating so many aspirations for a national art, will wilfully or ignorantly neglect and allow to die out, one of its few really racy and original native manifestations of the creative spirit.

America might today have the finest illustrated books in the world, the joy and the envy of the collector for centuries to come, if she knew how to conserve and utilize her artistic riches instead of letting them go to waste along with so many of her other resources, physical and moral.

Meredith's Letters

"The Letters of George Meredith here brought together have been printed first and foremost for his friends," says his son in a prefatory paragraph.* And surely they will be welcomed by a host of friends, the world around, for studious readers long have been drawn in friendliness to this good and happy giant of the intellect, whose thoughts were too high for the multitude in his lifetime. They should make new friends for him also and send them to his works in prose and verse to learn more about the big-hearted and big-brained philosopher of life who repeatedly told his correspondents "the best of me is in my books." In the first place, permeated as they are by the compelling charm of a great and noble personality, these letters prove that George Meredith had a genius for making friends as well as for writing philosophical novels and poetry. Far more than an account of the writer's life, doings and sayings, the collection is a record of high and noble and enduring friendships. Always peculiarly plastic to circumstances and individuals, the letters to each friend conjure up the individuality of that friend; we share

*_Letters of George Meredith._ Collected and edited by his Son. Two volumes. New York: Charles Scribner's Sons. $4.

Meredith's interest in what his friends are doing, whither they fare and how, the books they write and the books they read, whatever befall them, whether good fortune and high honors—or accident, bereavement and pain. And we are introduced to a noble company: Leslie Stephen, John Morley, William Hardman, Admiral Maxse, J. C. Morison, Swinburne, R. L. Stevenson, J. M. Barrie, Thomas Hardy, Sidney Colvin, Watts-Dunton, Tom Taylor, James Thomson, Frederick Greenwood, the Duff Gordons, the brothers Fitzgerald, Edmund Gosse, Prof. James Sully—and many good women. Meredith was ever the chappion of woman's freedom to advance. In 1888 we find him writing to a fair reader:

> Women who read my books have much to surmount in the style, and when they have mastered it and come to the taste, I am well assured of their having discovered in me one who is much at heart with them. I have this feeling for women because, what with nature and the world, they are the most heavily burdened. I can foresee great and blessed changes for the race when they have achieved independence, for that must come of the exercise of their minds—the necessity for which is induced by their reliance on themselves for subsistence. Thus they will work out their problem.

Of ordinary autobiography, the outward facts of the writer's daily life, there is comparatively little in these letters—occasional glimpses of his travels, walks and talks; occasional apologetic references to his poor health; abundant proof of his loving solicitude for the welfare of his son Arthur; wonderfully beautiful expression of his love for her who became his wife—and poignant references to her last sickness and her death. There is much about his pleasure in good reading (and a wealth of critical appraisal of good literature, ancient and modern) and about his joy in work. Poetry was easier to him than prose composition, indeed at times was so insistent upon utterance that it could not be resisted—though there was no market for it, and he had to pay dearly out of his own pocket for publishing his poems. He does not complain of, but takes philosophically, the neglect of the populace, but we come to realize to what a great extent his large productiveness as novelist was due to the necessity for toiling incessantly to keep the wolf from his door.

While not supplying such general autobiographic detail as the curious and the lovers of gossip might wish, these letters really constitute a spiritual autobiography of surpassing value—and this is their true significance. George Meredith lived a long and an arduous life. His zest for life and his interest in humanity he kept keen to the hour of the last summons. And nothing human was ever foreign to him. By an experience of life which many would account hard and bitter, but which he welcomed bravely and cheerfully, he learned the meaning of life and the right use of life—its true value. He learned early that "in this life there is no life save in spirit." And the life of spirit is continuous:

> I do not look on death as a victory over us. Death and life are neighbors, each the cause of the other: and the task for us, under stress of deprivation, is to take our loved ones into the mind, and commune with them spirit to spirit—so will they be wedded to us faster, closer about us, than when we had the voices and eyes.

The many letters to friends bereaved by death are unique for their nobly simple expression of deep human sympathy coupled with wise and loving counsel of the acceptance of this larger view of life as including death. As he wrote of Leslie Stephen, "He has the starry philosophy—above terrestrial shocks." To another he writes:

> I have lived long enough to see that our chief agonizer and thwarter is impatience. One of the prettiest spectacles to me is a costermonger's donkey going blithely at the trot. Our maxim should be, merry in harness,—while we have to serve.

And again;

> Yes, I have the confidence, which began with hope and strengthens with experience, that humanity is gaining in the stores of mind, and that the significance of this gift of life, that we should leave a better world for our successors, is being understood.

Even at the age of eighty he wrote to Prof. Sully: "My mind is bent on the future (little for myself, as you

may imagine)." He never lost "the rapture of the forward view," which he sang so gloriously in his prime.

He did not save all his best things for his books, rich as he made them in epigrammatic wisdom, but showered wise and witty phrases lavishly on his friends. Writing to his son's wife in 1902 he says:

> You have a liking for little phrases; I send you three:—Love is the renunciation of self. Passion is noble strength on fire. Fortitude is the one thing for which we may pray, because without it we are unable to bear the truth.

But limitation of space prevents anything beyond a mere suggestion of the varied riches of these volumes. No lover of good reading can afford to miss them. There is fun and frolic in abundance, humor that can be broad and rollicking, or subtle, or sly, or dainty. There is sage comment on men and affairs (including a shrewd appraisal of Mr. Roosevelt). The little missives of the latter years to his little grandchildren are among the most sweetly charming letters in this kind ever printed. The tone thruout these hundreds of letters is unvaryingly manly and courageous, and above all helpful. They form the autobiography of a great and living soul—one of earth's noblest sons.

Training in School and College. By William Lyon Phelps. New York: The Macmillan Co. $1.

This volume is not a book on the science of teaching: it is, as Professor Phelps is careful to point out, a discussion of the art of teaching—a very different thing. The long, practical experience of the author and his remarkable success make his message worth listening to, and the clear and vigorous style in which it is presented ensures that it will receive the full attention it deserves. The author has clear and positive opinions, upon which he insists with emphasis; but he is in every case careful to support his statements with entertaining illustrations drawn from personal experience and observation. Professor Phelps believes that the colleges would be more efficient if they kept more of the rigid discipline of the lower schools, including "the daily marking of recitations and of written work," written examinations and regular attendance. As he views the matter, "the two most efficient institutions of education in the United States are the military academy at West Point and the naval academy at Annapolis." He agrees with Professor Lounsbury as to the failure of required English composition in colleges, saying: "I know of nothing in the world that illustrates more beautifully the law of diminishing returns." Any teacher will be interested in this book, for he will be sure to find in it some things that confirm his opinions and some that contradict them.

Peter Ramus and the Educational Reformation of the Sixteenth Century. By Frank Pierrepont Graves. New York: The Macmillan Co. $1.25.

Professor Graves has followed his *Great Educators of Three Centuries* by a detailed biography of *Peter Ramus* and a critical analysis of his works. Ramus had a more exciting history than falls to the lot of most college professors, as he was a Huguenot in that terrible century of civil war in France and was one of the victims of the massacre of St. Bartholomew's Day (August 26, 1572). His revolt against the teaching of Aristotle made Ramus unpopular with the scholars of his day, just as his Protestantism antagonized the ecclesiastics. He was principal of the College of Presles as well as a professor in the College of France, and a man of great beauty and dignity of character, as depicted in this admirable biography. The efforts of Ramus as a reformer were directed toward simplifying the methods of scholastic instruction: his religion was a Protestantism in advance of his day.

Great American Writers. By W. P. Trent and John Erskine. New York: Henry Holt & Co. 50 cents.

To say that a book is a worthy member of the Home University Library series is a sufficient review in itself, for it means that the book in question is interestingly written by competent authority. Of course, the literary history of America can only be outlined in such brief compass as these volumes afford. All that is given is a brief series of biographical sketches of a few of the more important writers from Benjamin Franklin to Mark Twain, together with concise bibliographies and criticisms. This much is done and well done, as might have been expected from the well-known ability of the authors, who, notwithstanding the fact that they are professors of English, know how to write.

The Soul of a Tenor. A Romance. By W. J. Henderson. New York: Henry Holt & Co. $1.35.

Mr. Henderson's venture into the realm of fiction must be pronounced a decided success. This is not to say that he has written a great novel, for it lacks breadth of conception, dramatic power and the magic touch of style. Nevertheless there are some elements of perennial interest and many more expressive of the time-spirit. The story, which is told with simple directness, is laid amid scenes with which Mr. Henderson is

well acquainted, and the characters, which bear the stamp of reality, come from musical and social circles concerning which the novel-reading public is ever eager to learn new things. Those with voracious appetites for facts or fancies about the seamy side of art life will be quite fully satisfied if not satiated with the unveiling of the quagmire of professional intrigues, petty jealousies and irregular sex relationsships sometimes, tho we trust not often, existing in the operatic world. There is so much of this highly colored surface material that there is danger lest the reader may stop here and give little or no consideration to the weightier and subtler matters relating to the influence of passion in expanding the soul and the corrupting tendency of successful musical interpretation. The latter is courageously and clearly presented by Mr. Henderson in the light of some of its most unpleasant and debasing results, but it is to be questioned whether the *Soul of a Tenor* having so far succumbed to baleful influences as did Baroni could be revived and purged thru the fires of passion, even when these were lighted and fanned into flame by so mysterious and seductive a creature as Mlle. Bosanska.

In the Amazon Jungle. By Algot Lange. New York: G. P. Putnam's Sons.

Mr. Lange spent the year 1910 on the Upper Amazon, first at Remate de Males, or "Culmination of Evils," a name amply deserved, then on a journey up the Itecoahy River, followed by a dreadful march thru the forest and a stay with the cannibal Mangeroma Indians, ending his experiences with a fight between the Mangeromas and the Peruvians. Then came a happy deliverance and a return in shattered health to North America. Wild beasts and gigantic fish, insects, snakes and a boa constrictor 42 feet long added to the interest and excitement of the adventures. The story Mr. Lange tells makes one shiver, but if a man wanders off into these dismal regions he must be prepared for what awaits him there. Mr. Lange's account of the rubber region is sufficiently vivid and depressing. The photographs which illustrate his book are excellent and truly representative of the character of the land. Those who like to think of the vast possibilities of development in South America will be given food for thought by this realistic account of the swamps, the jungle, the savagery, the unusable mass of forest, the climatic depression, the fevers of the vast areas of the Upper Amazon. The little that was possible in a year's adventures such as these shows how much remains to be done in South American exploration and the study of the interior Indian life. It is the account of Indian customs which is of chief value in Mr. Lange's interesting book, tho the reader will not want interest in any part of the remarkable tale which he survives to tell.

The Moon Endureth. By John Buchan. New York: Sturgis & Walton Co. $1.37.—*Pan's Garden.* By Algernon Blackwood. New York: The Macmillan Co. $1.50.

Two volumes of tales touching upon the supernatural have more than a superficial likeness. In each, powers of the invisible world strive with men to win and destroy them. In *The Moon Endureth,* the evil influences are the lingering deities of old religions in "The Grove of Ashtoroth," or ancestral spirits as in "The Green Glen"; in *Pan's Garden* they are the powers of Nature, struggling with man's soul, and might well have been suggested by Maeterlinck's "Blue Bird" in the scene where the trees turn against the children and seek to slay them. "The Man Whom the Trees Loved" and "The Transfer" are the most shivery of these tales, the latter having a thrill of real horror in the fancy of a bit of bare ground in the garden calling for the life of a man.

Atlantis. A novel by Gerhardt Hauptmann. Translated by Adele and Thomas Seltzer. New York: B. W. Huebsch Co. $1.50.

The recipient of the last Nobel prize award, made the subject of an article in our new novel, *Atlantis.* Frederick von Kammacher, about whose life cluster the incidents of the book, sets sail from Bremen in January, 1892. The date calls to mind Hauptmann's own visit to America: and the character suggests something of his creator's. Frederick is one of the "twilight souls" that lurked in the twilight of the late century: souls and days that seem faraway, tho Hauptmann is still their spokesman. Frederick von Kammacher is a physician; he has been Professor Koch's assistant. One false step has he made in his career of science, and his resultant ridicule has withered his ambition, as his wife's sudden madness has destroyed his hope of domestic peace. In his own words, Fate knocks at his door, he rushes to open—and catches cold. But the most striking pages of the German novel describe the wreck of Frederick's steamship. Every reader of newspapers feels that he has, individually, lived the deep-sea tragedy thru which the characters here pass. From firm land, Hauptmann has written the intimate story of a great ship's ruin. He wrote it, moreover, before the *Titanic* left the dock for her first and last voyage. Once he has recorded this overpowering event, the interest of his novel is bound to slacken, and by the time Frederick reaches land the tale is more than half told. Part II is, evidently, a vivid memory of America as it appeared to Hauptmann in 1894. Here are the Gerry Society, looming large; the Broadway cable cars; the feuds that rent City Hall in the mid-nineties. Hauptmann's hardest task he performs with dignity in dispersing the few survivors of his wreck. The dancer gathers the fruit of

her tragic celebrity; this man and that, let down without too sharp a drop from his brief heroic hour, slips into his groove. Frederick's wife having killed herself, Frederick weds a young sculptress, and studies her art—as Hauptmann yearned to do long ago. In the last chapter we find ourselves in Europe again: Frederick's wife is to bring up his three children and himself in the City of Flowers. This she will do, he naively explains, because she is "always ready to sacrifice herself in order to help artists out of every sort of difficulty." There is indication enough that she will have her hands full.

With Dante in Modern Florence. By Mary E. Lacy. 28 illustrations. New York: E. P. Dutton & Co. $1.60.

Picking up the fine threads by which the path of Dante is alone to be traced thru the modern labyrinth that Florence now is, Mrs. Mary E. Lacy restores the old city of 75,000 or 80,000 inhabitants, with a degree of success, so far as the traveler is concerned, quite above that of most of the skimmers and skippers who have their say in books about the great Tuscan poet. Like the German restorers of a Greek text, she is painstaking and honest; admits the paucity of material for a life of the real Dante, the real Beatrice, the real everybody whom Dante knew and loved or hated. All that actually is and was she manages to find, and, unlike the German Dryasdust, puts a sheen on what is, by some of the "might have beens," dear to the reader and traveler, as, for instance, on the corner where Dante might have had his first look at the little "Bice"; on the "seggia di Dante," where the "disdainful" youth might have sat watching his beloved Baptistery. The Florence of today is but a palimpsest of the old Florence, as she justly says, a writing over another writing, the new manuscript rather elegant and unpoetical; the old, rusty and irregular, hardly to be deciphered. The poet would efface the new; the statesman would efface the old. She has a little of both desires, but, with a woman's tact, gives better reasons for her conclusions than the Rev. Mr. Hare is able to assign for his. She is an intelligent lover of the old, but not a sentimentalist. In a chapter on Dante's color scheme in the world above and the world below she traces his artistic associations among the great painters of the early Renaissance. It is a very pretty picture that she gives us, among many touches showing the point of view of a woman, of Beatrice, as she appears to Dante in the earthly paradise:

> The Blessed Beatrice has a green mantle over the robe of flame color, that recalls to mind the dress of a "subdued and noble crimson," in which she first gladdened the heart of Dante on a certain May morning in Florence, so many years before, and her hair is wreathed with olive. Her eyes, those wonderful eyes, where all Heaven is reflected, are of the color of an emerald.

An altogether sensible and racy book.

The Flower of Gloster. By E. Temple Thurston. New York: Dodd, Mead & Co. $2.50.

Mr. Thurston, who is an English novelist of quaint and delicate fancy with an amount of endearing philosophy, believes in moving about the world. One day it occurred to him that no one knew anything about the canals of England, and himself least of all; so he set about hiring a barge. Its leisurely progress appealed to him: it gave a chance of seeing the lone bypaths of rural England and of getting as close to nature as one could possibly hope to nowadays. On a fine May morn the good barge, *The Flower of Gloster,* towed by the patient steed Fanny, left Oxford, her crew being Eynsham Harry, a bargee, and the author. For a month the voyagers pursued their plodding passage of three or four miles a day, and this book is the log. It is a slow-moving chronicle as is appropriate, full of fine touches, not a book of enthralling interest but one to muse over in the evening. Harry is a character with charm, a water gypsy, and his friendship with the birds and beasts of the fields will endear him to all. The author preserves a somewhat aloofish, but pleasantly philosophic outlook upon the scenes and people among which they passed, and his observations are fresh and penetrative. W. A. Dakin has contributed six drawings in color and many in black and white.

The Reef. By Edith Wharton, New York: D. Appleton & Co. $1.30.

After *Ethan Frome,* one awaits any further manifestations of Mrs. Wharton's subtle art with keenest anticipation. *The Reef,* newly published, justifies this interest without repaving it. Here we are transported as far from the barren New England of the Fromes as from the crowded cruelty of Lily Bart's New York. Paris in springtime, Middle France in all the gracious perfection of a well-kept château,—these are the scenes of a heartless conspiracy against the weak-willed characters' peace of mind.

THE "FLOWER OF GLOSTER"
One of W. R. Dakin's illustrations for E. Temple Thurston's latest book. (Dood, Mead & Co.)

Perhaps the best portrait is that of an ardent young American girl, lightly vivid and wholly courageous, who pays too dear a price for her few hours of May sunshine. When Mrs. Wharton's personages converse, they flagrantly plagiarize Henry James; but for the novelist's skilful exposition, for her rendering of shaded values and precious settings, for her felicity of expression in an age of untamed syntax, we have only praise. The tale's dependance upon improbable coincidence may be taken for granted, given the circumstance that we have it from Mrs. Wharton; but, coincidence aside, it affords no solution, little profit, less pleasure. Certainly it is not the story that avails, for the story is progressively intolerable.

Parallel Source Problems in Medieval History. By F. Duncalf and A. C. Krey. New York: Harper & Bros., $1.10.

Five episodes in history—the coronation of Charlemagne, the humiliation of Henry IV at Canossa, the capture of Jerusalem in 1099, the departure of the university from Paris, and the coronation of Rienzo—are chosen as themes for study. In each case all the documents of the time bearing on the event are given in full (in translation), as well as notes on the historical setting of each event treated and a discussion on the nature of the sources. A well chosen series of questions furnishes the basis for comparison of the different accounts with a view to training students beginning research work in the handling of materials. For elementary purposes the book is admirable.

The Mortal Gods. By Olive Tilford Dargan. New York: Chas. Scribner's Sons. $1.50.

A comedy and two plays more or less tragic form the staple of Mrs. Olive Tilford Dargan's strong and thoroly readable volume. Tho the comedy and one of the other plays are set in the very abysm of time, one of them in the backward, or Athenian age, the other in the abysmal, or chivalric period, when battle axes weighed twenty-two pounds, and tall words were at a premium, the spirit of the drama in both is essentially modern, while the play that gives title to the book is frankly modern in conditions, characters and problems. All alike are in the high-stepping dialog of some of the less acceptable passages of Shakespeare, which one takes kindly to only because they are associated in the great bard of Avon with the conception prevailing in the Elizabethan period, that kings must necessarily be represented as on stilts in their daily intercourse with one another. Being "the anointed of God," they must come to the stage lights in "thoughts that breathe and words that burn." With Mrs. Dargan the stilts are well built, and her persons look very well sometimes on them. Multi-millionaires, for instance, with their tall royalties, with kingdoms in Mexico, in Central America, South Africa and elsewhere, probably deserve the lofty verbal conveyance for their high thoughts and it may be that their lovely daughters drop epigrammatic gems and pearls from their pretty mouths when they work in the slums, or lead a rebellion in Peru, but in these days when we are getting down to the hard pan of realism in our forms of expression, it is unexpected, to say the least, except in farce, to find a couple of nobles of Goldusan in conversation with royalty, getting away from hard pan thus:

ZIRALAY: My lord,
The Assyrian prince is captured, and is held within the town.
CORDIAZ: What? Chartrien?
ZIRALAY: Yes, my lord.
CORDIAZ: Fit period to this dedicated day!
Our gentle bonds are now forged whole. The man
Who was Bolderez's hope, most luminous
Of all who drew rebellion to him, now
Is darkly fallen.
RUBIREZ: This golden aid cut off,
Bolderez stands so bare his nakedness
Will sprint to nearest cover.

Here we walk on stilts, but get a fall in sprinting, that might well "make the judicious grieve." This is in a modern theme. In the time of the later Crusades one, keeping Shakespeare at her shoulder, might conceivably say to her lover:

No prayer of mine
Shall fetter youth to bloodless vows. And you
Look not as one faith-leeched to life. Your cheek
Is sodden gray, not changeless pale. 'Tis hued
Like rebel morning pushing back the dawn
Too eager for its peace.

Very lovable and modern is the fair lady who says this, but in our day even Shakespeare would recognize the academic hat and scent the midnight oil.

The Fortunes of the Landrays. By Vaughan Kester. Indianapolis: Bobbs Merrill Co. $1.35.

At first sight this novel with nearly 500 pages of closely printed matter frightened us. It took us back to the three decker days of fiction, when novels were not to be skimmed but provided entertainment for many leisurely hours. But plunging boldly within the covers we found to our surprise that we swam buoyantly. In spite of its diffuseness, its constant change of scene, its long-winded sentences, it is a story to be marked. Not for its characters, none of whom make any lasting impression, except the drunken Gibbs, but for its vivid picture of growth and progress of the country. The story concerns the three generations of Landrays, a family of Benson, Ohio; Stephen and Bushrod, who perished on their way to the goldfields of California; Bushrod's son, Stephen, and later the young Stephen. The two characters who run thru all the pages are Virginia, wife of the first Stephen, and Jacob Benson, the family lawyer, whose love for her led him to wrong her in his conduct of the estate. It is rather he, than the Landrays, who is the central figure in this contribution to American history.

The Master of The Oaks. By Caroline Abbott Stanley. New York: Fleming H. Revell Co. $1.25.

There is nothing particularly distinctive about the title of this book, and the wooden illustrations are greatly to be deplored. Yet the story is well worth reading; for the author has told in a simple, unaffected way the tale of a man's effort to escape from his past and live the life of rectitude and "constructive sympathy" that offers itself. She has also told the way in which that effort is made useless for a while, until further discipline has tried his soul in the furnace of suffering. Perhaps the story of an escaped convict trying to begin over is not a novel one. But the reason behind his return to prison to work out the remainder of his sentence—because by doing so he can free another man who has been imprisoned for life on the charge of having murdered him—makes the plot rather unusual. Archer McLain, the hero, is a real man, with all a man's faults yet some very evident virtues. Jean Dabney, the girl who loves him, is an attractive figure, simple in faith and loyal in nature. The book is full of well-drawn characters. Mrs. Debo, particularly, is a delight with her quaint philosophy. The scene is laid in Mississippi, and a strong flavor of the South runs through it all. The talk of the population of Goose Creek is filled with the tone of the southern mountains. There is a description of a funeral among these people that is excellent, and the account of the gathering of those who neglected the dead man in life is sketched with a firm hand. Sad in parts, the story shows always a saving sense of humor, and leaves one with the feeling of hope and a more assured realization that

> . . . Men may rise on stepping stones
> Of their dead selves to better things.

Moths of the Limberlost. By Gene Stratton-Porter. With Water Color and Photographic Illustrations from Life. 8vo., pp. 310. Garden City, N. Y.: Doubleday, Page & Co.—*Injurious Insects.* How to Recognize and Control Them. By W. C. O'Kane. 12mo., pp. 414. Illustrated. New York: The Macmillan Co. $2.

Two books at hand on insect life present antipodal aspects of the subject. Mrs. Stratton-Porter's beautiful volume exhibits the beauty and poetry of the subject, as shown in the brilliant moths and their curiously interesting processes of reproduction and metamorphosis. An enthusiast in the study, she has gathered and reared many lepidopterans, watching every phase of their life-history with an intent and inquiring eye, and photographing and painting each stage with artistic sense and zeal. The result is as beautiful a volume as is conceivable on the subject, and one filled with accurate observation and suggestive thoughts. It is a model of truly scientific writing for popular comprehension, and the colored plates are extraordinary specimens of reproductive art. Professor O'Kane's book is equally commendable in another way, for it is a purely practical guide for the agriculturist and gardener to the insect pests that assail him, and the methods of controlling their mischief. It is illustrated by no less than 606 figures from photographs which it must have taken years of industry to collect—mostly made by the author. There is also an introductory part describing insects in general. The book ought to prove of great service.

Yale Book of American Verse. Edited by Thomas R. Lounsbury. New Haven: Yale University Press. $2.25.

Professor Lounsbury has here collected two hundred and fifty poems, with a leaning toward the lighter forms of verse, the authors being arranged chronologically. Bunner, Field, Hovey and Stedman are each represented by nine or ten poems, Lanier by two, Taylor by none, but a Yale book would naturally favor Stedman. We are glad the compiler refused to follow Phebe Cary's authorized version of *Nearer Home* as given in *her Hymns for all Christians,* and sorry that he did not restore Phebe Brown's lines:

> I love to steal awhile away
> From children and from care,

instead of giving Dr. Nettleton's *Village Hymns* version. The "Word About Anthologies" which prefaces the work is well worth reading.

Literary Notes

The *Bible Record,* hitherto the organ of the Bible Teachers' Training School in New York, appears with the New Year as the *Bible Magazine.* It is simply exegetical, without being critical on the one side nor obscurantist on the other. It accepts Scripture as it is without question or quarrel.

The Voice of the Garden, by Olsam Renwood Urban, is a beautifully printed, thin, square octavo volume illustrated by several unusually good half tones of garden scenes. The five chapters are on the technique of gardening—also reflections on such subjects as Art, Sentiment and Voices in the Garden. The writer goes so far as to accept the suggestion that plants have feeling and will in their own measure. (Philadelphia: Thos. Meehan & Sons.)

Carolyn Wells has prepared a characteristically whimsical and witty description of Arcady—bounded on the north by the Land of Heart's Desire, on the east by the Gulf of Time, on the west by the Mountains of Opposition and on the south by the Sea of Dreams. The book is entitled *The Lover's Baedeker and Guide to Arcady* (Stokes. $1), and describes the way in, the way out, excursions, hotels and so on, with special reference to honeymoon tours. The text is in prose and verse and Mr. R. D. Blashfield's charming illustrations add an attractive embellishment to a dainty book.

Bishop Brewster of Connecticut has put into permanent form several articles and addresses, some of which have already appeared in THE INDEPENDENT and other magazines, bearing on the general theme, *The Kingdom of God and American Life* (Whittaker; 80 cents). There are present in all the discussions an intelligent recognition of the pressing problems originating in the swiftly developing social life of our country, and a strong insistence on the necessity of a high idealism in any effective solution. Bishop Brewster finds the way out in a more energetic and fearless application of

> that gospel of the Kingdom of God which means the realization of certain ideals at once through social relations and through the highest and fullest development of personality.

Under the title *Jean-Jacques Rousseau* Bernard Bouvier publishes his lectures delivered at the University of Geneva. This solid study of the man's psychology and work is issued by Jullien of Geneva. The second centenary of the birth of the great Swiss has evoked other volumes, one of them an account of *Jean-Jacques Rousseau révolutionnaire*, by Albert Megnier (Paris: Schleicher freres), and two of them by Emile Faguet: *Rousseau penseur* and *Rousseau artiste*, of which the former has appeared (Paris: Société Française d' Imprimerie et de Librairie.) Meantime André Martin-Decaen has written an account of *le Dernier Ami de J. J. Rousseau: le Marquis Rene de Girardin* (Paris: Perrin.)

Professor Alva Agee, head of the school of agriculture of the Pennsylvania State College, has added a title to the long and lengthening list of books about the new agriculture (*Crops and Methods for Soil Improvement*, Macmillan). The book treats the whole question, lucidly and earnestly; and there are some good photographic illustrations.

A Lesson in Turkish. The London *Times* has taken pity on our perplexity and supplied us with the following list of the words which most frequently enter into the composition of the geographical names mentioned in the cables from the seat of war:

"Perhaps the one comforting feature is that most of the Turkish names, at any rate, have meanings which make them easier to remember. The traveler or reader who knows that *ak* means white and *bunar*, spring or fountain, is not likely to forget the name Ak Bunar, nor be surprised to find that there are several places of that name between the Tchataldja lines and Constantinople. The number of small Albanian colonies scattered over European Turkey sufficiently explains the number of places called Arnautkeui to anyone who remembers that an Arnaut is an Albanian and *keui* a village. Among the other most common words that occur in place-names may be mentioned *shehr*, tower; *hissar*, castle; *kale* or *kaleh*, fort; *khan* or *han*, inn; *kupru*, bridge; *liman*, harbor; *burun*, cape; *cheshmeh*, spring; *chiftlik*, farm; *kum*, sand; *agatch*, tree; *kavak*, poplar; *bagh*, park; *baghcheh*, garden; *dere* or *dereh*, valley; *su*, water or river; *irmak* or *yirmak*, river; *tepe* or *tepeh*, hill; *dagh*, mountain; *kumur*, charcoal; *kumurdji*, charcoal burner; *tash*, stone; *bash*, head; *chekmedjeh*, passage; *boghaz*, strait or pass; *fener*, *fanar*, or *phanar*, lighthouse; *geuk*, sky; *tarla*, field; *ova*, plain; *kapu*, gate; *top*, gun; *orman*, forest; *harman*, threshing floor. These are substantives. Among the most useful adjectives are *eski*, old; *yeni*, new; *kara*, black; *ak* or *beyaz*, white; *kizil*, red; *buyuk*, great; *kuchuk*, small; *uzun*, long; *kuru*, dry; *orta*, middle. From most substantives adjectives can be formed by the suffix *li*."

As if Paris were not sufficiently crowded with statues of men of letters, a committee has been formed (with Anatole France as President and Maurice Barrès a Vice-President) to see to the erection of a Flaubert monument. This is apropos of the fiftieth anniversary of the novel *Salammbô* and of the inauguration of the famous *dîners Magny*. Moreover, a notable reëdition of Flaubert's works has just been completed by the Imprimerie Nationale, and three works of criticism have just been issued with Flaubert as their subject—the authors being René Descharmes and René Dumesne (*Autour de Flaubert;* 2 volumes; Mercure de France), Louis Bertrand (*Gustave Flaubert;* ibid.), and Jules de Gaultier, author of a book entitled *le Bovaryisme*, in two essays, on *le Genie de Flaubert* (*le Mercure*, November 16 and December 1, 1912.) The first of the studies named traces the critical history of *Salammbô* and of *Madame Bovary*. Flaubert's novels were attacked in some quarters as stupid or as deficient in style—elsewhere on moral grounds. But his works have survived to be praised by Mgr. Dupanloup as "masterpieces." Probably they have never been read widely enough in this country to endanger morality—the Lafcadio Hearn found it impossible to persuade any publisher to issue his translation of the *Tentation de Saint-Antoine*, brought out not long ago by the Alice Harriman Company of New York and Seattle. The English text of last production, replete with sterile learning, was submitted to Bowdlerization, however, before its issue. It is the rewritten *Saint-Antoine* that is accessible in English. The first version, that of 1849, was only recently published in France, with the Conard imprint. Today one need not accept Brunetière's statement that Flaubert's hatred of human stupidity was "only the projection of his own inanity (*sa propre sottise*) over the things he couldn't understand," but M. de Gaultier surely overstates the case for the disillusioned romantic when he raises him to the plane of Shakespeare and of Goethe.

Advertising Affirmations

By George French.

[*In the series of articles of which this is the first it is proposed to treat this great topic in a broad and fundamental manner, showing how advertising may be employed to promote business, social, religious or ethical affairs. Mr. French, who has recently become the publisher of* THE INDEPENDENT, *has for many years been closely identified with the development of modern advertising and is the author of "The Art and Science of Advertising" and "Printing in Relation to Graphic Art."*—EDITOR]

Advertising is the art of inducing people to perform certain specified acts, or adopt certain specified policies, suggested and described in the advertisement, for the benefit or advantage of the advertiser.

The primary purpose of advertising is to create business for the advertiser. The secondary purpose is to inform the advertisee about a possible or potential source of benefit to him. The primary purpose, though obvious, is usually not specified and often inferentially denied. The secondary purpose is usually made the chief element in the advertisement. The success of the advertising depends upon the efficiency of the appeal to the self-interest of the advertisee.

It is clear that there is no more subtle and difficult problem in the whole range of man-to-man intercourse than this problem of inducing great numbers of people to do that which advertisers wish them to do.

In all other fields of psychologic appeal there is the large element of disinterestedness. The preacher, despite his zeal for the welfare of his people, realizes that his duty is fairly well done when he has made his appeal. So of the author, the scientist, the lecturer, and all who practise the arts of exposition and persuasion. For them the fruits of their labors, by their quantity or quality, do not materially affect the character or the continuity of their work. But the advertiser must persuade his readers to respond with their money, in definite proportional volume.

The advertiser cannot argue his case. He gets none of the inspirational help the reaction from personal audiences gives preachers and lecturers. He can appeal only to composite qualities, to traits common to a majority of his inert audiences. The preacher has his audience before him, prepared to listen, predisposed to accept and agree. The advertiser has only fractional attention from audiences indifferent to him and ignorant of his wishes; and he can only say a few cold words to them.

It is thus evident that the appeal in advertising must be extraordinary in character, and that its expression must be such as to force the advertising motive into indifferent minds and prompt a quick and favorable response. The advertiser's "prospect" comes within his sphere of influence for only a fleeting moment—during the fraction of a second while the eye of the reader flits over the magazine or newspaper page, intent upon its quest for information or entertainment.

The great difficulty of advertising is thus realized. The advertiser can only convey to his prospect a few definite words, the bare outline of one idea; and he can have the attention of his prospect but for one brief period of time. There is no opportunity for argument, for elaboration, for applied persuasion, for explanation.

But notwithstanding the extremely constricted sphere of its operation, advertising has become one of the most definitely known among the professions. Its processes are as sure as those of any science. Its results may be as exactly predicated as those of chemistry or medicine.

There is this extraordinary difference between advertising and all other arts, professions or sciences, that whereas each art, profession and science has its special, definite and strictly delimited field, advertising possesses, and may be operated in, every field of human interest; and in all fields it is the most potent of all influences in producing results.

Wherever it is necessary to convince and lead men and women, advertising furnishes the best method and promises the most definite and largest results. All of the power of advertising is derived from its ability to influence people. Its practitioners—those who have acquired proficiency—have learned the great art of inducing people to follow them, by long and profound study of the mind.

The proper and legitimate field for advertising is infinitely wider than the promotion of the sale of merchandise or service. It may be employed in religion, in ethics, in civics, in the promotion of great charities It may be made the means of securing industrial peace. Its usefulness to society is but just being suspected.

Misleading the Uninformed

By W. E. Underwood

There comes to our desk from an undisclosed source a copy of *The C. K. of A. Journal,* published at St. Louis in the interests of the fraternal order known as the Catholic Knights of America. Our unknown friend has blue-penciled an article bearing the caption, "Old Line Insurance Not Popular," in which the assertion is made that old line endowment insurance has declined in favor because the insurance investigations made in recent years have shown that policyholders "get beaten in the large majority of cases." By way of supporting the assertion the writer adds:

> Let us illustrate. Take the man insured on the 20-year endowment plan. The public record of both the New York Life and the Mutual Life companies shows that of the endowment policies terminated by the death of the holders a large majority had run for only ten to fourteen years.

Then follow the conclusions: the beneficiaries have received only the face of the policies, although the insured paid premiums covering death and investment; that the insured were losers and that the companies were the gainers. The alleged gains, we are told, go into the coffers of the companies; that they are free-will offerings by the insured, involving no responsibility by the company for their return. "It was just such excess money," concludes the writer, "that made up what was termed in the insurance investigations the 'irresponsible millions'."

There are other irresponsible millions—those who, to their own injury, are misled by such guides as the writer above quoted sets himself up to be. What he preaches in the guise of one having authority, that is to say, as one having knowledge of the subject, is mischievous because it is not true. Hundreds of thousands of uninformed and confiding people have been misled into wasting the insurable years of their lives in assessment schemes by plausibilities of just that sort.

We are told that the public records of two leading legal reserve companies show that of the Endowment policies terminated by the death of the holders, a large majority had run for only ten to fourteen years. There are no public records of those companies extant from which that conclusion could be derived. In order to make a point against the Endowment form of insurance, the writer states that those who carry it and die between the tenth and fourteenth year, might have had their protection cheaper under the Ordinary Life plan. They could have had it cheaper yet under the Term plan; but they didn't expect to die and they wanted a sum of money at the end of a given period of years. Had they taken term insurance and lived to old age, the Term insurance would have turned out very expensive. Again, had those who have Endowment insurance and who live to mature it, taken Term insurance instead, they would have had protection during the term, but no cash at the end.

It is not true that a large majority of the 20-year Endowments terminated by death run from ten to fourteen years only. The American Table of Mortality shows that (using age 35 for our illustration) of 81,822 persons alive at that age, 64,563 are alive at age 55—17,259 dying during the 20-year period. Of these, 7649 die during the first ten ears, 3442 die within the next succeeding four years, and 6168 die during the last six years. As, according to the American Table, only 3442 out of 17,259 die between the tenth and fourteenth year, we plainly see how utterly absurd is the assertion that a "large majority" of them die in that period.

If an intending insurant suspects that he will die early, he should secure a Term policy if he can induce any company to issue it. On the other side, those who have expectation and prospect of old age, and can afford the investment, are wise in choosing an Endowment policy. There are many plans at many prices, and each man selects that which best suits his needs and financial circumstances.

The figures quoted from the American Table indicate that nearly 99 per cent. of those alive at age 35 will be alive at age 55, about 21 per cent. dying during the twenty years. The premium charged for the 20-year Endowment takes this chance of dying and of living into account. The insured pays for what he gets. Had he taken a 20-year Term policy, he would have insured against death only during that period, and at the end of that time, if alive, he would have nothing due him. His protection against death was all he paid for, and that he received.

"The insurer was the loser," says that unreliable counsellor, "the company was the gainer." He means the insured was the loser, for the insurer is the company. He doesn't perceive that—particularly in pure mutual companies—the entity he calls the company neither loses nor gains. It simply administers.

Classification of Experience

Classification of fire insurance experience is a subject which is closely engaging the attention of managing underwriters generally, and a few Insurance Commissioners. The New York Insurance Department has evinced particular interest in it during the last half year. Most of the fire underwriters of experience are agreed that to undertake the work involved in classification would be not only difficult, tedious and expensive, but that the results would be unsatisfactory, inconclusive and impracticable. On the other hand, there is a minority composed of prominent managers who do not agree with this view of the matter. A discussion of the subject, participated in by a constantly increasing number of underwriters and supervising officials, is bound to ensue and our readers will be kept advised of its progress. Classification may point the way to a more scientific system of fire insurance rating, but as yet that fact has not been demonstrated.

Bonuses to Policyholders

Following a practice adopted some twelve or fifteen years ago, the Metropolitan Life Insurance Company has voluntarily set aside several million dollars to be used as dividends by its industrial policyholders. This company transacts what is known as a non-participating business, which means that its policy contracts do not provide that policyholders are to receive dividends. But the Metropolitan awards these additional benefits anyhow. Holders of certain industrial policies issued prior to January 1, 1907, are to receive bonuses aggregating $6,281,571, this money to be distributed in 1913, in addition to a dividend of more than a million and a half declared a month ago. The bonuses are of two kinds—premium bonuses and mortuary bonuses. The premium bonuses vary in amount from premiums for five weeks to premiums for fifty-two weeks, dependent on the particular policy and the length of time in force. The mortuary bonuses are additions to policies when they become claims and run from five per cent. to thirty per cent. of the face of the policy. This is good work in the interests of the industrial classes holding policies in the Metropolitan.

The New York Insurance Department purposes issuing a bulletin about the middle of each month, containing information about insurance matters that will be of interest and value to the public and insurance companies.

Financial

Trade and Securities

The market for securities last week was characterized by exceptional dulness. On the New York Stock Exchange only 721,055 shares were sold (the sales in the corresponding week of 1911 having been 3,159,310,) and on Thursday the number (101,080) was the smallest for a full day in the last year and a half. Price changes showed a slight decline, the losses for Reading, Union Pacific and Steel, (which supplied nearly 40 per cent. of the week's business,) ranging from ¾ to 1. New Haven's net loss was 2½, due to the indictment of President Mellen and the president of the Grand Trunk. Announcement was made of an issue of $12,000,000 of new stock, at par to shareholders, by the Lackawanna railroad company. As the stock outstanding amounts to only $30,277,000, and shares have been selling at $585, the value of the present stockholders' rights or privileges, with respect to the new issue, is about $69 for each share of $50. Money hardened during the week, rates for loans on call rising to 12 per cent. on Friday, although they fell to 1½ at the close of business on that day. The movement was regarded as a natural one, due mainly to preparations for approaching heavy dividend and interest payments and to the mercantile demands of an active holiday season.

The year was closing with highly favorable reports as to general trade and the leading industries. Continued activity at the steel mills prevented any holiday suspension of work except upon Christmas and New Year's days. The companies were to begin the new year with an unprecedented number of unfilled orders. The *Iron Trade Review* said:

> Pressure for deliveries continues very strong, and prices are firm. Buyers in the market for prompt delivery do not hesitate at all to pay premiums. Mills in Eastern Pennsylvania are able to charge high prices for shapes and plates and to ship them hundreds of miles, passing mills of the Central West that are unable to make deliveries until far into next year. In finished materials, some companies have sold large tonnages for delivery during the last half of the new year. One company, which opened its books a few days ago for last half delivery, quickly placed all the tonnage it had to sell, and retired from the market.

Notice of a forthcoming increase of wages was given by the Steel Corporation. In general trade the holiday retail sales have been very large. *Bradstreet's* says: "What is described in most sections of the country as a record holiday trade has crowned a year which has had few equals and fewer superiors in nearly every line of human endeavor." In the Northeast, at the close of the year there was some talk about the need of caution, owing to impending tariff revision and the high price of raw materials, but it was generally expected that the activity of the last few months would not be checked, and that the prevailing prosperity would continue.

The profit on the share capital of 74 Lancashire cotton spinning companies in the year ending with November last was 12¾ per cent., against only 1 per cent. in the year immediately preceding.

The foreign commerce of the United States in 1912 broke all previous records. Imports were about $1,800,000,000, against $1,563,000,000, the "record," in 1910, and exports were about $2,400,000,000, against the previous "record" total of $2,093,000,000 in 1911. There was a gain (in ten months) of $100,000,000 in imports of manufacturers' raw materials, and the exports of cotton, (for eleven months,) exceeded those of 1911 by $91,000,000.

The number of miles of new railroad main track constructed in 1912 was 2997, which may be compared with 3066 in 1911, and 4122 in 1910. The new cars built were 155,489 in 1912 and 76,407 in 1911.

The Steel Corporation will offer stock to its employees this month at 66 for common shares and 109 for preferred. In 1912 subscriptions were received from 36,946 employees for 30,619 shares of preferred, at 110, and 30,735 shares of common, at 65.

Imports of diamonds and other precious stones at New York in 1912 amounted to about $40,500,000. Prices advanced about 25 per cent. during the year.

Alaska's commerce with the States and with foreign countries in 1912 has been the largest in the territory's history, amounting to nearly $63,000,000. The leading exports were: gold, $17,200,000; copper ore, $5,000,000; canned salmon, $13,200,000; other fish, $1,100,000. In the canning industry 14,800 persons are employed.

The number of beef cattle received at the Chicago stock yards this year was less by 281,298 than the number received in 1911, but $3,282,736 more was paid for them.

In its annual report the Mergenthaler Linotype Company, speaking of its export trade, says that "owing to our higher wages, lack of a merchant marine, lack of foreign banks to finance machine purchases, and weakness in the consular service, foreign competitors, particularly in Germany and England, have a great advantage."

The Comptroller of the Currency has issued an order to all national bank examiners, and a notice to directors of such banks, that bank directors will be held personally liable for losses on loans made in excess of the limit prescribed by law.

Mr. Taft's Two Speeches

Saturday was a heavy day for President Taft. Besides attending Ambassador Reid's funeral, he was present at a lunch given by the Peace Forum, and in the evening at a dinner given by Union League and Republican clubs at which fifteen hundred were present, and at each meeting he made important addresses.

It is not strange that people have a kindly, even affectionate, feeling for Mr. Taft. They may not like his policy or his friends, but they like him. The cheeriness with which he takes his overwhelming defeat is charming. He could joke over it, saying that Mr. Bryan had prophesied that he would be unanimously rejected, and that only Vermont and Utah prevented the prophecy from coming true, and in fact Mr. Bryan was nearer right than he had ever been before in his life. Mr. Taft, unlike some others we might mention, is a good loser.

But his defense of his administration was not the most notable part of his speech to the Republicans who had supported him. Much more serious and weighty was his criticism of the policy of those who would relax the restraints of the Constitution. This is well said:

> It is said that we distrust the people if we assume that the majority will ever do injustice. In other words, the contention is that the vote of the majority is always right. Well, as the majority, in passing upon a given question, determines sometimes one way and sometimes another, in which case is it right? If the wisdom of our fathers and of the long line of able men who have fought for popular government has led to the introduction into every scheme of government of restraints to prevent injustice by the majority in the minority and the individual, what is there that has happened in recent years to make us feel that a change has come over the character of majorities so that they may not exercise the tyranny that they have exercised in the past?

If President Taft means that he objects to the right of a majority, perhaps temporary, at any whiff of sudden pleasure to annul our constitutions and to reverse the decisions of courts, then we agree with him, tho we do believe the time has come to make the government more amenable to permanent popular will.

Quite as important was the President's address to the smaller company of the Peace Forum. Very strongly he exprest his disappointment that the Senate refused to approve the arbitration treaties he had negotiated with Great Britain and France. It was a very great misfortune, and it relegated the United States to the rear in the peace movement; for it fixt for the time the rule that the United States cannot bind itself to arbitrate on every question, and it laid down the rule that on every case of difference as it might arise the Senate must intervene and decide whether it will arbitrate or not. This puts us in the rear of the nations. But that is past history. Present and future history concern us more. We are very glad that the President can give us hope that the Canal difficulty with Great Britain may be referred to arbitration before his term ends. That would be a great achievement, and in a measure an atonement for the error the Presi-

dent made in signing the act which discriminates in favor of American shipping. Why he should have done that we cannot understand; but now that he yielded to the faithless blunder of Congress, it is something that he should now shut the stable door. Perhaps the horse may be recovered. He knows very well that the reason why some legislators will object to referring the difference to arbitration is because they fear they will be beaten. Said he:

> You must expect sometimes to get beaten. A sure thing among gentlemen who bet even is not regarded as the most honorable standard for making bets. The cause of peace is one that is bound to grow and its influence will work even upon that rock ribbed body, the Senate of the United States.

Italy did not refer its difficulty with Turkey to arbitration because it knew it could not get what it wanted. The Balkan states knew that arbitration would not give them what they wanted, and they sought no arbitration. If the Senate is wilful and is determined to have its way, right or wrong, then it will not arbitrate; but we agree with President Taft that the people have too much sense of justice to allow the Senate to repeal its blunder of the two arbitration treaties.

One-Man Commission Government

Fort Kent is a little town in Maine which three years ago found itself $21,000 in debt. As the town raised only about $25,000 a year in taxes it was felt that something was wrong, as this deficit had been created within a few years. One Jean O. Michaud was asked to take the chairmanship of the Board of Selectmen and try to get the town out of debt. He, however, refused to take it unless they would elect him as well to the position of road commissioner, overseer of the poor, school commissioner, and whatever other administrative offices the town charter called for. His proposition was accepted, and he was elected to these various offices, the only other two officers of importance in the town being two selectmen who worked with him. At the end of two years' time the town was entirely out of debt, and this year it expects to have some surplus money to put into permanent improvements, this all being done without raising any more taxes than formerly. The success was due to better management and closer supervision of expenditures.

Direct Action as a Weapon

We would not have our readers understand that we accept either Mr. Tridon's philosophy of labor or his statement of facts in reference to the Lawrence strike. Various statements made by him in his article in this issue would require correction or interpretation. It is true, as he says in his first paragraph, that Congress has past no anti-injunction bill, but the Supreme Court in its procedure has given important relief. In the second paragraph he says that the two labor leaders arrested for murder in the labor riot at Lawrence were liberated on a threat by Haywood of a repetition of the Haymarket incident. That is far from true—Haywood was regarded by the authorities almost as a joke, and they did not fear him. Mr. Tridon speaks of the Cœur d'Alene and the McKees Rocks strikes as the longest in the history of modern labor. But the Harriman strike and the Westmoreland strike lasted a year, and the West Virginia strike nine months. The benefits he claims for direct action strikes are just the same as for any labor strike, the education of it, the unification of laborers, the publicity, etc.

But it is the philosophy of direct action, or of syndicalism, that is most to be considered, and we are glad that Mr. Tridon has put it plainly in all its hideousness. He says:

> The mere bettering of living conditions is not an aim, but a means to an end; the end being the ousting of the employers as such, and the taking over of their industries by the workers.

To accomplish this any device of war is right. No agreement is to be made with employees. The laborer will take what he can get by a strike, and make no truce. He will strike, he will spoil the goods and machinery without striking, while pretending to work, all with the aim of making business so unprofitable that he can take to himself the factories.

Now this is simple robbery and dishonor. It is no wonder that the great Federation of Labor under Mr. Gompers has officially condemned sabotage in all its forms, and will make no terms with syndicalism. So the Socialist party condemns it. But that makes no difference to the men whom Mr. Tridon assumes to represent, for they do not care to wait to secure a majority; a minority can stir up mischief and destroy the security of society.

Mr. Tridon tells how to do it. Coal can be set on fire in the pockets; explosives can be put in boilers; acids can be used to corrode boiler tubes, or emery put in the oil-cups; and dynamos and transformers can be managed by short circuits and inversions of poles. Such acts are, of course, criminal, but direct action knows nothing of statute law nor of the obsolete Ten Commandments, quite out of date. They "fight unhampered by any of yesterday's ethical considerations." Syndicalism has no use for Christianity or religion, which, we take it, were invented by rulers and capitalists to keep the common people under.

We do not believe that the direct action is likely to work a revolution. Mr. Tridon is utterly wrong when he says of the Lawrence strike: "This was another victory for syndicalism or Industrialism," meaning the I. W. W. The success of the strike, so far as it was a success in an agreement reached between the workmen and the employers, was not achieved by syndicalist methods led by Haywood and Ettor, but in an utterly different way. It is the very essence of the syndicalist philosophy to throw overboard the ordinary machinery of politics and use violence. So long as this was done the strike was a dismal failure. But at last they appealed to Congress for an investigation, and a very spectacular display they made before the committee. They sent down fifteen little children to be an exhibit in the case. When it looked as if Congress would send a committee to make investigation the corporations got frightened and agreed to a compromise. So it was not direct action, but the very reverse of its principles, political action, that gained success, and Haywood himself went down to Washington to help the appeal.

What is surprising is not so much that untrained foreign workmen should be taken captive by leaders who tell them that the world belongs to them; but that well-educated literary writers, men who never did a stroke of industrial work, should in their emotionalism and their utter absence of any basis of fine ethics, be carried away by the rough, lawless force of a policy which recks not of God or man. It seems beautiful to them. They follow Haywood much as a bench of giggling girls go wild over the physical prowess of a quarterback. Their naive, childlike faith in the new policy is queer to see. These direct actionists in the field of labor expect to be the leaders of a violent revolution in industry, but the future is not with them. It is rather with the sane forces of labor which know the difference between right and wrong, and which do not desire to force and terrorize their associates, as if it were the right of the minority to rule the majority.

Vaccination Against Typhoid Fever

The announcement by Surgeon-General Stokes of the United States Navy before the Committee on Naval Affairs of the National House of Representatives proclaims a great new advance in the prevention of disease that the public ought to be familiar with. Surgeon-General Stokes declared that since the introduction

of vaccination against typhoid fever some eleven months ago not a single case of the disease has occurred among the 64,000 enlisted men in the navy. As typhoid fever is one of the diseases which are almost constantly present among large bodies of men, especially when they have to wander around and are likely to partake of water in many parts of the world, this announcement represents a proclamation of the virtual control of one of the most important epidemic diseases of modern times.

Similar reports have come from the army of the United States and indeed the preservation of the health of the United States army when mobilized on the Mexican border some time ago made a record in military hygiene, especially in the matter of fevers due to intestinal causes and the great improvement in the health of the men when thus gathered in a large body was considered by those in a position to know to be entirely attributable to the fact that anti-typhoid vaccinations had been freely employed and proved protective. Similar reports have come from armies in many countries in recent years. The English armies in Egypt, in Cyprus, in Malta, in Gibraltar and in South Africa have all been almost marvelously protected against this disease which is so common among large bodies of men. In the English army in India anti-typhoid vaccination tho entirely voluntary has become so popular that practically all the soldiers asked to be vaccinated and in many regiments the proportion of those voluntarily vaccinated against typhoid fever is over ninety per cent. Indeed in some regiments every soldier has submitted to it. In the Japanese army some 30,000 soldiers have been vaccinated against typhoid fever with excellent results and the Russians have adopted the same practice.

French experience with the anti-typhoid vaccination has been particularly satisfactory and is reviewed by Professor Grasset of Montpellier in a recent number of the *Revue des Deux Mondes* (November 15th, 1912). One very serious test of the immunizing power of this form of vaccination was made in North Africa. In the month of August, 1911, a large number of vaccinations against typhoid were made in conditions that could not but seem very unfavorable. There was an epidemic of the disease in full swing, the men were very much fatigued by the campaign and by the almost deadly temperature which reigns at this time of the year and all the condition for facile infection, by drinking water, by flies, by contagion directly from those affected with the disease because of the intimacy of the intercourse among the men, were present. In spite of these unfavorable conditions not a single one of those vaccinated acquired the disease. There was not even a case of gastro-intestinal disturbance accompanied by fever among them. The vaccine material is so prepared that it protects not only against genuine typhoid fever, but against paratyphoid fever and other fevers due to infection in the gastro-intestinal tract.

The immediate effects of anti-typhoid vaccination are in general quite insignificant. Prof. Grasset mentions that he has seen a number of persons continue their ordinary occupations without having to interrupt them in any way even for a few hours. This is indeed not at all unusual. Something less than ten per cent. of those who are in good health at the time of vaccination suffer from slight fever, a little headache and some light disturbance of the gastro-intestinal tract for a few hours. All the symptoms noted are much less marked than those which have been most often observed after vaccination for smallpox among individuals who are being vaccinated for the first time. Altogether there has not so far in the world experience with typhoid vaccination been a single serious accident. Anti-typhoid vaccine then is quite inoffensive and now after more than three years of wide military ex-

perience with it, in the armies of every civilized country, it is clear beyond all doubt that it is quite efficacious. In the English armies some 150,000 men have been vaccinated and there is no doubt left at all of its complete harmlessness yet thorough immunizing power.

Prof. Grasset insists then that for France anti-typhoid vaccination should be made compulsory. He points out that if vaccination against smallpox had been made compulsory in France many, many thousands of lives would have been saved. Napoleon recognized this and introduced vaccination into the army in his time with excellent results. Even with the rather lax methods in vogue as regards vaccination for the disease, while smallpox used to attack ninety-five out of every hundred persons during the eighteenth century only five out of every hundred persons have suffered from it during the nineteenth century. As the average annual number of deaths in France from typhoid fever is 6000 it can be readily understood that it would be most satisfactory if some sure means of preventing this could be secured. Prof. Grasset advises that Jennerian vaccination should be done at three periods in life, at birth, at the eleventh and at the twenty-first year and that anti-typhoid vaccination should be done at the age of seven, and at eighteen and finally at twenty-eight years of age. Young children very seldom contract typhoid fever and after the age of forty it is rare because the glands, which are particularly attacked by the typhoid bacilli are gradually disappearing at this time.

To many people it will seem that the enforcement of a second form of vaccination must be entirely out of the question since even the attempt to enforce one form leads to protests of all kinds. It is probable, however, that the public can be gradually educated to realize the benefit that would flow from national immunization against typhoid fever. Many thousands of precious lives would be saved every year and an immense amount of time and expense would be saved in the care that has to be devoted to typhoid fever patients. Only about one in ten of those attacked die, but the remaining nine have to be nursed through the fever itself and the long convalescence for months and in the meantime are themselves of course a burden instead of a help to the community. The eradication of typhoid fever would mean the saving of millions of dollars every year and an immense amount of human suffering, solicitude and anxiety. The disease takes away particularly those in the prime of life and does not spare even the most robust. Indeed many an athlete has met his fate in the early twenties from typhoid fever. If then vaccination will protect against it surely the sooner we begin to think like Professor Grasset that vaccination for it should be compulsory the better it will be for this country in every way.

Railroad Crossings at Grade

Our State Legislatures and Railroad Commissions might well pay more attention to the grade-crossing problem. Every week there are reports in the press of loss of life at unguarded railway crossings. In every State there are such crossings with long records of fatalities. These are brought to mind and enumerated whenever an addition to the dreadful list is made, but rarely is there any attempt to take the protective measures which the successive fatal accidents suggest. The two reports which follow were printed last week:

BELLEVILLE, Kan., January 1.—Wilson James, his wife and two children were killed near here by a passenger train which struck the buggy in which they were driving. Laird, the engineman, said he did not know his train had killed anyone till he reached here. The little girl's head, with a bit of blue ribbon tied to the hair, was found when the engine was being oiled at the terminal. Soon afterward there came the news that the buggy had been struck. A switch engine was sent back and it picked up the bodies. The mother, a two-months-

old baby and a three-year-old girl, were killed instantly. The father was breathing when picked up, but died shortly afterward.

DENNISON, Ia., January 4.—Five persons were killed and two probably fatally injured when a Chicago & Northwestern train struck a carriage one mile from here shortly before last midnight. The dead are John Evers and his six-year-old son; John Reimers, his wife, and five-months-old baby. The injured, John Reimers, aged six, and Minnie Reimers, aged fourteen, were taken to a local hospital, where it is stated neither can recover. A sharp curve at a point just east of the crossing made it impossible for the engineer to see the carriage until too late.

There are more than 3000 grade-crossings in New Jersey, where a bill requiring the companies to eliminate one each year for every thirty miles of road was vetoed several months ago. In their annual report the State's Public Utility Commissioners, last week, asserted that "to require the carriers annually to eliminate a certain number of grade-crossings per mile might easily bankrupt several of the smaller roads." They recommend an equitable distribution of the cost among the companies, the municipalities and the State. In every State there should be a settled policy, enforced by legislation, concerning the gradual removal of such crossings and the protection of life at those which remain in use.

The Federal Offices

A large majority of the Democratic party's rank and file desire, we think, that the party, having an exceptional opportunity, shall commend itself to the American people by wise action with respect to important questions, such as revision of the tariff, improvement of currency laws and the Trust problem. It will also be judged by the attitude of its leaders toward the Federal offices, and that attitude, so far as it is indicated by prominent and active Senators and Representatives at Washington, is not what it should be. There is evidence of a consuming desire to obtain control of these offices. It appears in the public criticism of Mr. Taft because he placed 36,000 postmasters under the merit rules of the classified civil service; in the avowed determination to prevent confirmation of nearly all of the appointments recently sent by him to the Senate; in the opposition to his intended nomination of Colonel Goethals to be Civil Governor of the Panama Canal Zone, and in a project, reported to be under consideration, for the enactment of a law that would end on July 1 next the terms of all civil officers —such as postmasters of the highest class, collectors of customs and internal revenue and marshals—who are appointed by the President. Thus far there is no indication that those who are responsible for what has been said and done with respect to the offices have the sympathy and approval of Governor Wilson.

The embodiment in legislation of the principles of civil service reform was a long step forward. Mr. Taft has largely increased the number of those Federal officers and employees who are protected, in the public interest, by the merit rules. During his term, and before the defeat of his party at the recent election could be foreseen, he urged Congress so to amend the law that all postmasters, collectors, marshals and certain other officers now appointed by the President should be covered by it. He would have had all these placed in the competitive and protected civil service, taking their offices out of politics. The latest national platform of his party says:

> We reaffirm our adherence to the principle of appointment to public office based on proved fitness and tenure during good behavior and efficiency. The Republican party stands committed to the maintenance, extension and enforcement of the Civil Service Law, and it favors the passage of legislation empowering the President to extend the competitive service so far as practicable.

Congress did not honor his recommendations by legislation in accord with them, but he did what he could. There are Democrats in the Senate or the House who now seem to have forgotten the following words in

their party's latest national platform, the platform adopted when Governor Wilson was nominated:

> The law pertaining to the civil service should be honestly and rigidly enforced, to the end that *merit and ability* should be the standard of appointment and promotion, *rather than service rendered to a political party.*

Mr. Taft has sent nominations to the Senate. If the Democrats there stand by their own platform they should ask whether the nominees are commended by "merit and ability," and should not prevent confirmation simply because of the nominees' political affiliations. He was authorized by the Panama Canal Bill, passed some months ago, to organize a civil government for the Canal Zone. It has been his purpose to nominate Colonel Goethals for Civil Governor. But the nomination is not to be made. By inquiry, as well as from the public assertions of Democrats, he has ascertained that confirmation would be prevented. The passage of the Canal bill was urged some months ago on the ground that prompt action was required. Democratic legislators said then that authority for organization of the civil government should be granted without delay. But now the Senator who leads the movement against the President's pending nominations says it would presumptuous for Mr. Taft to name a Governor several months before such an officer will be needed, and the Representative who had charge of the bill in the House expresses a hope that, if the nomination be made, action upon it will be prevented. "The talk about honoring Colonel Goethals," he says, "is not a sufficient pretext to justify premature action. We all wish to honor Colonel Goethals. We are proud of him." Why, then, should his appointment be opposed? Is it not in order that some other man may be brought forward for the place, after March 4? We are confident, however, that President Wilson will not exclude Colonel Goethals.

It is asserted that the project for a law to end the terms of Federal officers on July 1 next, in order that their places may be filled by Democratic nominations, will be laid before the Senate's Democratic caucus this week by a committee to which the subject was referred. We hope that no such proposition will be considered or brought forward. There are Federal officers, appointed by the President, whose terms will extend through a considerable part of the term of President Wilson. If these officers are competent and honest, and if they have made no improper use of their official influence, they should not be disturbed, but when the term of any one of them ends he should be reappointed. Such action would be in accord with the Democratic platform. The party cannot afford even to consider any project for the legislation of competent and faithful officers out of their places in order that other men, known to be Democrats, may be named to succeed them.

We do not believe that those who are thus seeking the offices as spoils have the support of Woodrow Wilson. The record of his life and of his public utterances warrants an assumption that he is true to the principles of what is known as civil service reform. If these Senators and Representatives expect his sympathy and aid, we think they will be disappointed. And his power and authority will be needed for the success of their project. He is familiar with the platform adopted in the Baltimore convention. He may find it expedient to remind them of what it says about the civil service.

Scientific Management in Reading

Slowly the methods of economy and efficiency which nowadays go by the name of "scientific management" are spreading from the shop to all departments of our activity. In the matter of reading it is particularly needed because, owing to the impetus given to the production of literature by wood pulp and advertising,

most people have more books to read than they have time to read. Books that once were chained to desks or sold at the price of a slave or a wife are to-day to be had for a song; in fact, a song of Caruso's would stock a Carnegie library with the world's best literature. For five cents on a Sunday one can buy enough reading matter, such as it is, to serve as an excuse for skipping both morning and evening service. Whenever we pass a newsstand a score of magazines shriek at us in red and yellow voices to be bought. In the old days it was necessary to save up reading matter, like apples, to last thru the winter under penalty of having to borrow of the neighbors if the supply ran out before spring. Now we have to look out lest we get overstocked and cannot unload upon our neighbors fast enough to keep the house clear.

The reason we bring this up here is because THE INDEPENDENT is designed to meet just this difficulty. It is intended as a time saver, not a time consumer. It is the busy man's magazine, giving him in condensed form and readable shape what is most important to be known of what the world is doing and thinking. Nobody is too busy to read THE INDEPENDENT, because the less time they have the more they need it.

Our aim is really more modest than our language would indicate. To be frank about it, THE INDEPENDENT does not expect to stand first in the estimation of its subscribers. It is content to be regarded as an indispensable second. The most important periodical of a man who is doing things is that dealing with his profession or trade. But man is more than a machine, so he wants to know something about what is being done outside his field of labor, and that is what we try to tell him. The medical article in this week's issue is not intended primarily for doctors. It is designed for lawyers and clergymen. The well-read physician will have learned from his medical journal all about the parasites of disease, so he will naturally skip this article and read something else that may be trite to the lawyer or clergyman, but is news to him. We publish much on country life and we hope it is useful to those living in the country, but if a man does not know any more about farming than he can learn from THE INDEPENDENT he is not likely to get rich at it.

If a man has leisure enough to read the *Congressional Record* thru every day he will have no use for our brief discussion of the doings of Congress. If he has kept up faithfully with the daily allowance of four or five columns of news and surmises from the seat of war he will not care to read what we say about it at the end of the week. But the man who cannot afford to give more than ten or fifteen minutes a week to the disorders in the Balkans or in Congress will find what he needs in the few pages we devote to these topics.

It is because it is necessary to provide for the needs of many men of many minds and women with as many more that we touch so briefly on so great a variety of subjects. We are always calling upon our contributors to boil down their articles. If we get a 5000-word contribution that we like we send it back with a letter saying how delighted we should be to publish it in 2500 words. If the article is 500 words we are likely politely to inquire of the contributor if he could not say the same thing in 250. The grieved or incensed author sometimes charges us with an unworthy motive, assuming that it is due to the fact that we pay at space rates and forgetting that what we do not pay him we shall have to pay somebody else. No, it is not to save our own money, but the reader's time, that we are so insistent upon boiling down. And what does "boiling down" mean? It means simply evaporating off the surplus water while retaining all the essential ingredients. Really it is surprising how far you can boil down the ordinary article before it gets dry or begins to taste burnt. There is a law against watering milk and there is likely to be a law against

watering stock, but the prevalent deplorable practice of watering literature has no check except the editor's regard for the interests of the reader.

We should like to write two pages more on this subject, but no, we will take our own medicine and stop short right here.

Fraud Practiced by Mail

The Post Office Department continues its pursuit of those who make a fraudulent use of the mails for the sale of worthless stock, bonds, corner swamp lots and the like, and it has been notably successful, having procured the conviction and punishment of 452 of these rascals in the year which ended with June last. But this was not done in time to prevent the swindling of thousands of deluded investors, for these scoundrels robbed the people of $120,000,000 in that year.

They should be attacked by the local county or municipal authorities in the places where they occupy offices, in which their fraudulent plans are laid and from which their deceptive prospectuses and invitations are sent. It is not creditable to the people and the official prosecutors of the county and city of New York, for example, that rascals having offices in that city should be able, unmolested for months and even for years, to draw money fraudulently from the pockets of persons living near at hand as well from those of residents of distant States, and that punishment should be inflicted only by the Federal postal authorities, usually when the fraudulent work has been almost completed.

Cassandra and Hobson

There is a difference between Cassandra and Hobson. Cassandra was a good prophet, but nobody believed her. Hobson is a poor prophet, and nobody believes him.

It was on February 20, 1911, that Mr. Richmond P. Hobson, Member of Congress from Alabama, made a memorable speech of warning. He solemnly assured his fellow-members that we were on the eve of war with Japan, a sudden war which Japan would spring upon us unprepared, and he set the date as twenty months, within which time we should be attacked. Hear him:

> It is high time to consider what we should do when this Nation is struck—Members may differ with me as to when that day may come—I will tell you frankly that, in my judgment, you can count almost on the fingers of your two hands twice around the number of months. In my judgment it will come before the Panama Canal is completed. But whether you accept my opinion or not, whether we agree as to the date, that time is going to come. This Nation is not going to prepare and the day is going to come when it will be struck by a nation that is prepared.

A member asked Congressman Hobson if he meant to say that war would come within twenty months; and he answered, "Yes." What nation did he mean would make war on us? and he answered, plainly, "Japan."

> Ever since this Nation went into the Hawaiian Islands, the Japanese nation served notice that they would never acquiesce; ever since 1898, when we went into the Philippines, and Japan asked us to let her go in there with us and we refused; ever since her citizens have come to this country in great numbers and our people, following the natural law of segregation of races, have not given them the treatment they thought they ought to have, they have been preparing for war. Preparations have gone on in every department. If the gentleman will take the pains to look at it, whether for the army or the navy, whether for the merchant marine and the transportation, whether for the finances or diplomacy, he will find the war is already prepared for and has been for a number of months.

We have waited anxiously for the twenty months to pass. They have elapsed now. On the twentieth of October last the dread period ended. We have waited since over two months to allow full time for the prophecy to come true, but not a keel of war has left the navy-yards of Japan. Hawaii is still safe; the Philippines are undisturbed. Japan keeps up the pretense of amity. What will Hobson do? What

shall we do with Hobson? When the prophets of the end of the world missed a date they put the day forward a year or two; why should not Hobson do the same? And we will believe him, just as much as we do the succession of Millerites.

Richmond P. Hobson is a national nuisance, a breeder of mischief, a stirrer of war. As a prophet he is proved ridiculously false. The country should pay attention "Nevermore," to this croaking raven, prophet of evil that does not come. Even so Wali Dad "carried the curse of unstanched speech" to the Red Chief Gholum Hyder, and cried, "The Russ is upon us!" And the Red Chief put him up a peach tree with a score of bayonets under it to watch till the Russians came, or to fall on the bayonets' points. It would not be courteous for Congressmen to point Hobson to a Washington peach tree.

In Brief

See how great a matter a little fire kindleth. A girl in the Chicago high school reported to her Sunday School teacher that a teacher had said that the Church of England was founded by Henry VIII, which is not very far from the truth. The Sunday School teacher complained to Mrs. Young, Superintendent of Schools, who summoned the high school teacher before her, who denied she had said such a thing, for she knew her history better. Then Mrs. Young wrote a circular letter to all the teachers of history and literature, admonishing to be very careful not to make such statements as this about Henry VIII.

No great honor attaches to the United States, as far as the public can see, for not allowing ex-President Castro, of Venezuela, to visit the United States. He is not an imbecile, not likely to become a public charge, nor suffering from any infectious disease. The only reason that would seem to justify his detention at Ellis Island and his deportation is the fear that he might try to stir up a revolution in Venezuela, but he could be watched and arrested if engaged in any overt act.

For one reason we should not at all regret to see Mr. Bryan Secretary of State, and that is his devotion to the cause of international peace. We believe that it would be his main purpose in position, to make a great peace record for the Administration.

While we cannot yet rejoice in the termination of the Balkan war, it appears almost certain that the end of the week will see Turkey urged and forced by the powers of Europe to consent to the terms insisted on by the four nations. The cost has been terrible on both sides, and many years will be needed to repair the losses, but the result will doubtless be good even for Turkey, even as her defeat was the rehabilitation of Spain.

In the report which Congressman Jones, of Virginia, presented to the House of Representatives in favor of giving independence to the Philippines, there appears this extraordinary statement: "There are many different dialects spoken in Siam, and yet this non-Christian country, with no standing army, has never fallen a victim to any land-grabbing nation." He forgot that a few years ago France took a piece of Siam on the east and Great Britain another slice on the west.

Many times has cholera been disseminated from Mecca by the pilgrims who assemble there. In the four days that ended with December 27 the disease caused 1714 deaths at that place, where more than 10,000 pilgrims had recently arrived. It would be profitable for the civilized world to procure the careful sanitary supervision of Mecca and its wells and pilgrims by means of an international commission.

The resignation of Senator Bailey, of Texas, need not be deplored as any great loss to the Senate. He has had very bitter fights with his fellow Democrats in Texas, and after a victory a few years ago declared in a public speech that he would never forgive his foes, and would bequeath to his children eternal war against them.

By universal consent the sentences inflicted on the dynamiters at Indianapolis were light, considering the crime, but perhaps they were not too light considering the offense for which they were tried. Under State law for a more serious crime they would have received heavier punishment.

Senator Bacon, who is no tyro in statecraft, has introduced a bill for the recognition of the republic of China. It is time this was granted, and we wish that the United States might be the first to welcome the youngest and greatest of republics.

Mrs. Anna H. Shaw says that the British suffragists are praying for the success of their cause. We presume so; but not the suffragets.

The Workers' Only Hope: Direct Action

By Andre Tridon

[The rise of syndicalism or, as it is called in America, "industrial unionism," is the most portentous movement of the times in the labor world. It attacks on the one hand the establisht order of society and on the other the state of socialism which the social democrats have been advocating as a substitute for the present regime. Its plan is ceaseless class warfare without regard to the humanitarian rules of war which serve to ameliorate the strife between nations and to protect non-combatants and their property. Its weapon is "direct action," a euphemistic term which has been used to cover all sorts of violence. We have frequently discussed syndicalism in our editorial columns (Vol. LXXII, p. 419, 844, 850, etc.), but on account of the importance of an understanding of the movement our readers will want also to hear the other side by an authoritative exponent and sympathizer. Mr. Tridon has published many articles on various phases of industrialism in this country and in Europe and has reported several important strikes led by the Industrial Workers of the World for a great metropolitan publication. He is the American correspondent of the largest French syndicalist paper, *La Bataille Syndicaliste*. The results of his study of the subject will be publisht next spring in book-form. The following article has been passed upon by leaders of the movement in America, W. D. Haywood, Frank Bohn and Joseph Ettor.—EDITOR.]

Twenty-three years ago the workers of this country came to the conclusion that the power of injunction should be restrained. The fight which cost over a million and a half began in 1889 when Congressman Gardner introduced in the House an anti-injunction bill. To this day the fighters have had nothing to show for all their fighting.

Last January two labor agitators were arrested in Lawrence, Mass., and indicted for murder. They were like the Haymarket anarchists "accessories before the deed." They were kept in jail long beyond the six months limit provided by the Massachusetts statutes. Then Haywood gave the authorities a strong warning. A date was set at once for their trial. When it became evident that the world would witness a repetition of the Haymarket incident, another warning reached the court, Ettor and Giovanitti were freed.

When a group of American workingmen come to the conclusion that certain conditions are no longer bearable there are two courses open to them: they may express their desires in the form of a bill which will be introduced into Congress by a friendly representative; they may then trust to their good luck to have the bill passed by the lower House; after which it may or may never emerge from the files of the relevant Senate committee; it may in due time, and after much editing and trimming, become a law, but it has still to run the gauntlet of the supreme court, arbiter of things constitutional.

The process may be repeated for many years without a conclusion, positive or negative, ever being reached. Behold the efforts made by labor unions to have an anti-injunction bill passed. Three times since 1889 an anti-injunction bill has been voted upon favorably by the Representatives, but never has it become a law. The Senate committee on the judiciary to which it was referred never took any action upon it. The majority of the men who 23 years ago decided to take steps to limit the power of injunctions are now old men; many have died without even a gleam of hope that their wishes would be some day inscribed on the statute books.

The publicity and lobby work without which neither the public nor the house would realize the importance of a bill consume a good deal of the workingman's cash. Also when a case drags out for 23 years and is not nearer solution in 1912 than it was in 1889, the workingman's mind harbors a suspicion that the representative, a man of a different class, the press agent, an "intellectual," the lobbyist, a journalist or lawyer, are not as energetic and aggressive as the case would require them to be.

The expense account or as slang has it the "swindle sheet" of the various lobby "workers" is apt to be questioned by simple men who are innocent of taxicab rides and unfamiliar with the drink checks issued in fashionable bars. The judgment of those who once suggested the legis-

lative campaign or had a part in appointing the "workers" comes in for a good deal of hard criticism.

Behold on the other hand the longest strikes in the history of modern labor, the Cœur d'Alene, the McKees Rocks, and more recently the Lawrence strike. It is only a question of weeks or months. Whether a strike ends in victory or defeat, the suspense is soon over; furthermore the strikers themselves are caring for their own interests; the strike is an education for them, as it affords them more leisure to discuss conditions from every point of view. In the meeting hall they become better acquainted with one another; in certain cases, as in the Lawrence strike or in the cooks' and waiters' strike, the public is apprised of facts which could not have been exposed through any other procedure. At the end of the conflict the men, beaten or victorious, are better united for having fought together shoulder to shoulder.

This is, roughly speaking, the difference between parliamentary action and direct action. Direct action, however, should not for a minute be construed as synonymous with strike. Direct action is a new and elaborate weapon, the most formidable which the working classes have ever used; it is so formidable in fact that trade unions and Socialists are quite afraid of using it and the latter have passed a motion disqualifying any member of the party who advocates direct action.

Direct action admits of strikes, but not the kind of strike with which the public is familiar. If the unionized typesetters demand an increase in wages of $1 a week they may leave the shops until the increase is granted, after which they will sign with their employers an agreement by which they bind themselves to work at the new rate for 2 or 3 years.

A successful strike like the Lawrence strike on the other hand may assure the workers certain advantages, but it gives the employers no guarantee of peace. The fact that the satisfied mill hands returned to work did not imply the settlement, even temporary, of a labor dispute. It was a mere truce during which the attacking forces planned to recuperate and fit themselves for a renewed attack on an enemy with whom no treaty shall be signed and who must finally either destroy the workers or be destroyed by them.

During the periods of apparent peace intervening between strikes, direct actionists keep up the hostilities — tho in a different manner. Defeat or victory are preceded and followed by sabotage. Sabotage, at least in the opinion of many French syndicalists, is an essential of direct action. Strikes are mere tests of strength and part of the training which the workers must undergo in order to be ready for the general strike.

It may be mentioned before going any further that American syndicalists prefer to be spoken of as industrialists. This for two reasons: It is only recently that the French word "syndicalisme" has acquired its present connotation ("syndicat" meaning simply union). Furthermore certain anarchist groups in this country wish to be known as "syndicalist circles," with which the Industrial Workers of the World repudiate all affiliation. The practical matter of fact is, scientific industrialists of America have nothing in common with the erratic visions of the anarchists, nor have syndicalists or direct actionists anything in common with either Socialists or unionists. The Socialist pins his faith to a propaganda which may some day result in a Socialist victory at the polls, after which a Socialist majority will do its best to introduce socialistic institutions in the land.

Unionists recognize the existence of two classes, laborers on one side, employers on the other. While labor wishes to receive a fair wage for a fair day's work, it does not deny employers the right to exist as such.

Syndicalists scorn the idea of a "campaign of education." They want results, immediate results, secured

with the least expenditure of cash and energy. Secondly, they do not recognize the employer's right to live any more than a physician recognizes the right of typhoid bacilli to thrive at the expense of a patient, the patient merely keeping alive.

Finally, while both unionists and conservative socialists believe in action by a decided majority, syndicalists contend that direct action by a live minority is more productive of results than the grouping around of a sluggish majority. Pouget writes:

> Syndicalist action has nothing to do with government or majorities. If we obey the will of the majority, we allow ourselves to be led by the spineless ones, by the stand-patters who are always willing to be exploited. Keep your eyes open and you will soon notice that only the men of strong will, the rebels, those who are impervious to the influence of a mob-like majority, are doing work that counts."

Majorities are too inarticulate to express their wishes in legal or parliamentary parlance. When they succeed, now and then, in expressing a wish and vote into Parliament a "friend of labor" his morals are very soon corrupted by political dickering and entanglements.

The example of Briand, once an uncompromising anti-militarist and direct actionist, compelled much against his desire to wield the militarist club above strikers and beat them into submission, will for many years supply syndicalist orators and pamphleteers with evidence as to the uselessness of Parliamentary action. If a President du Conseil, the most powerful temporary ruler in Europe, supported by a solid majority, was unable to carry out any socialist measures and had to abandon the workers' cause for fear of national and international complications, what inducement is there for the workingman to finance electoral and educational campaigns of long duration or a continued propaganda?

Syndicalists hold that propaganda is a mere matter of expenditure in which the workers find themselves at a disadvantage. Also Yvetot points out the fact that a considerable increase in the socialist vote in a community merely brings about a coalition of the other parties which postpones the advent of a socialist majority until a more distant future.

The Milwaukee case illustrates fairly well the truth of the French leader's statement. Socialists won easily as long as Republicans and Democrats fought their battles separately. As soon as both parties combined Milwaukee was lost to the Socialist rule and the conservative propaganda, unhampered by the financial difficulties which beset radical organizations, will speedily offset what was gained in pre-Seidel days.

"The best form of popular propaganda," Haywood once said to the writer, "is quick results." And he added:

> It is easier to lead men away from the mill than to the ballot box. And what does the crowd care for a restricted ballot when, by the mere act of striking against certain abuses or for certain advantages, every human being, native or foreigner, man or woman, child or negro, is given the franchise and a hand in legislation, provided that human being is a producer?

A strike according to the syndicalist formula is quite a different thing from a strike according to the labor union or socialist formula. As William Trautman points out in his pamphlet, *Why Strikes Are Lost,* successful direct action demands two conditions without which strikes are most likely to end in defeat: the workers must be able to strike at the very time when mill and factories are rushed with orders and are least able to stand a sudden cessation of production; secondly, they must close not only one part of a mill or factory but the whole plant. Therefore no agreement binding either the whole working force or one craft must ever be entered into with the employers.

All crafts must be ready to stop work simultaneously at any time. The mere bettering of living conditions is not an aim but a means to an end; the end being the ousting of the employers as such, and the taking over of their industries by the

workers. This will be brought about by the general strike ior which, according to Griffuehles, former secretary of the French General Federation of Labor, "the workers must keep themselves in training, a training more rigorous every day."

By that daily training we must understand the practice of sabotage. Strikes may gain certain advantages for the workers, but sabotage well conducted is sure to bring about the employer's discomfiture. According to direct actionists, sabotage should be as far as possible beneficial to the ultimate consumer who, in the majority of cases is a workingman. Workers in the wine and packing industries who refuse to "wet" wines or who throw away harmful chemicals destined to preserve ephemeral liquids or embalm doubtful meat, cooks who waste so much margarine that this substitute for butter becomes as expensive as the original article, store clerks who refuse to sell a worthless "just as good article," insist on giving full weight, substitute truthful labels for those used on "sale days," painters who apply the specified coating of paint, etc., are engaged in beneficial sabotage.

Another kind of sabotage aims at ruining the retailer's trade: bakers may produce bread and cakes unfit for consumption or containing foreign substances; clerks may refuse to show certain goods or call the customer's attention to their defects.

Individual sabotage may assume a more aggressive form. Sebastien Faure and Pouget delivered recently on the subject of technical instruction as revolution's handmaid an address from which we quote the following extracts:

> The electrical industry is one of the most important industries, as an interruption in the current means a lack of light and power in factories; it also means a reduction in the means of transportation and a stoppage of the telegraph and telephone systems.
>
> How can the power be cut off? By curtailing in the mine the output of the coal necessary for feeding the machinery or stopping the coal cars on their way to the electrical plants. If the fuel reaches its destination what is simpler than to set the pockets on fire and have the coal burn in the yards instead of the furnaces? It is child's play to put out of work the elevators and other automatic devices which carry coal to the fireroom.
>
> To put boilers out of order use explosives or silicates or a plain glass bottle which thrown on the glowing coals hinders the combustion and clogs up the smoke exhausts. You can also use acids to corrode boiler tubes; acid fumes will ruin cylinders and piston rods. A small quantity of some corrosive substance, a handful of emery will be the end of oil cups. When it comes to dynamos or transformers, short circuits and inversions of poles can be easily managed. Underground cables can be destroyed by fire, water, plyers or explosives, etc., etc.

Such is the daily individual training to which Griffuehles alluded in his book. This is to be supplemented by strikes whose purpose is, as we stated before, not so much to wrest a small increase in wages from the employers, but to accustom the workers to concerted mass action. Of strikes there is many a kind: the sympathetic strike; the white strike, in which the laborers fold their arms and do nothing for an hour or a day, resuming work the very minute strike-breakers have been hired; the bumper strike invented by Griffuehles. Out of say five mills one is closed and the operatives of the other four pay one-fifth of their salary to the strikers; then the second mill closes, the operatives of the first one return to work, and so on.

Whatever category the strike may belong to, it must be of short duration. Frequent strikes, lasting only a few days, can inflict heavy losses upon the industry they disorganize without impoverishing the strikers. In France, where the organization of unskilled laborers is most perfect, the long strike is a thing of the past. To win or to lose within a week or two weeks while keeping the organization intact is now the aim of French syndicalist leaders.

In this fight syndicalists do not even pretend to observe the rules of civilized warfare. The flag of truce does not protect emissaries.

In one of his pamphlets, Yvetot, the great anti-military organizer, describes what took place in the course

of a strike among the Cette dockers. Representatives of the strikers, having been invited to meet the employers in the latter's office, locked the doors and windows, lighted their pipes and howled *l'Internationale* until their adversaries, half deaf and partly asphyxiated, signed a one-sided agreement prepared by the strikers. The fight unhampered by any of yesterday's ethical considerations is to continue until the leaders judge the syndicalist minority is strong enough to carry away the masses.

For a national aristocracy of labor, the skilled union men, syndicalism would substitute an aristocracy of activity and efficiency.

Unless the employers devise some very radical means to check the growth of the syndicalism army, the fight is likely to be rather uneven. Skilled labor is no longer a factor in the struggle between capital and labor; labor unions are not growing, nor have they any desire to grow; they are erecting around themselves high walls of prohibitive entrance fees; the green glass bottle blowers for instance paying $500 to join their aristocratic union, which keeps applicants three years on the waiting list; it is easier and cheaper for a café musician to become a member of a high class club than to be admitted into the ranks of the musicians' union. Moreover, no concerted action is possible on the part of the unions affiliated with the American Federation of Labor. There are at present some 27,000 distinct agreements between employers and unions, expiring on as many minutes in the year. For these reasons unionized labor is now as difficult to sway as the middle class.

In their plans for the future syndicalists disregard skilled laborers. The advance in specialized mechanical devices which enables a man to master in a few days the working of some simple and powerful machine will, syndicalists think, make the unskilled laborer the arbiter of the industrial world's destinies.

The syndicate, whose membership is open to any human being without distinction of race, sex or nationality, performing any kind of labor whatever, the "one big union" with its system of nominal fees and dues, employing no lobbyists, wasting neither time nor money in "campaigns," is bound to become the most gigantic factor in the industrial life of tomorrow.

In this country in particular where the ranks of unskilled labors are filled with many foreigners whose interests are totally disregarded by vote-seeking parliamentarians industrialism holds out irresistible inducements to the unnaturalized masses whom our politicians do not care to see naturalized.

Unless its leaders, however, adopt the tactics familiar to some of the spectacular French agitators, thereby keeping alive a little longer the dying spirit of leader worship, direct action may soon defeat its own purposes. Daring, unruly minorities may compromise the final results by engaging in sporadic, anarchistic action. Last spring two strikes of unskilled laborers were started without the help or even the knowledge of professional agitators and organizers, and were won. We can easily see what a few similar successes might lead to. Mr. Balfour said recently:

> It is a pathetic fact that many of the most earnest men of Europe regard the representative system as almost played out. It is pathetic when you think with what high hopes each successive development of the representative system has started out.

More than the capitalist and professional classes, the working class has suffered bitter disappointment at the hands of its "representatives." This is why it is forsaking more and more the mysterious ballot box for the more concrete process of direct action. It may be, however, that the growing distrust of parliamentary action noticed by Mr. Balfour may lead to a somewhat erratic and anarchistic distrust of all leaders.

From this thought the adversaries of syndicalism may derive a great deal of positive comfort.

New York City.

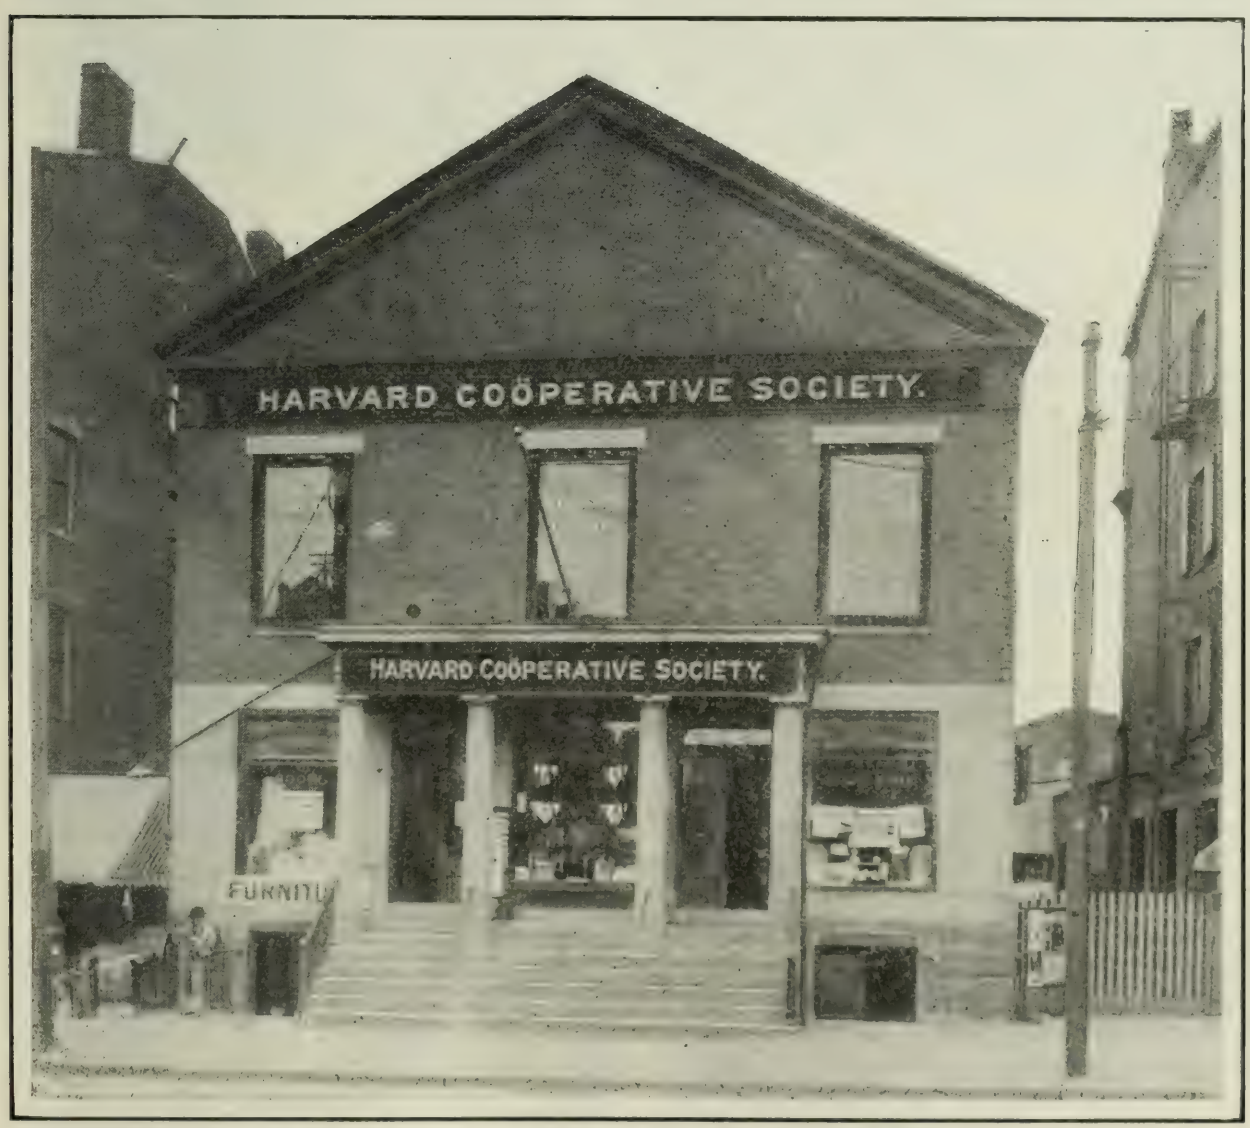
Coöperative Shopkeeping by Students

By William Bennett Munro

[Harvard men thruout the country are familiar with "The Coop," as the Students' Coöperative Store in Cambridge is commonly called. This institution represents a highly interesting experiment in retail coöperation and its success is attracting a good deal of attention at other American universities. What college instructors and students have done in the way of eliminating the middleman's profit and thereby lowering the cost of living is something which any other group of citizens ought to be able to do. The author is Professor of Government in Harvard University.—EDITOR.]

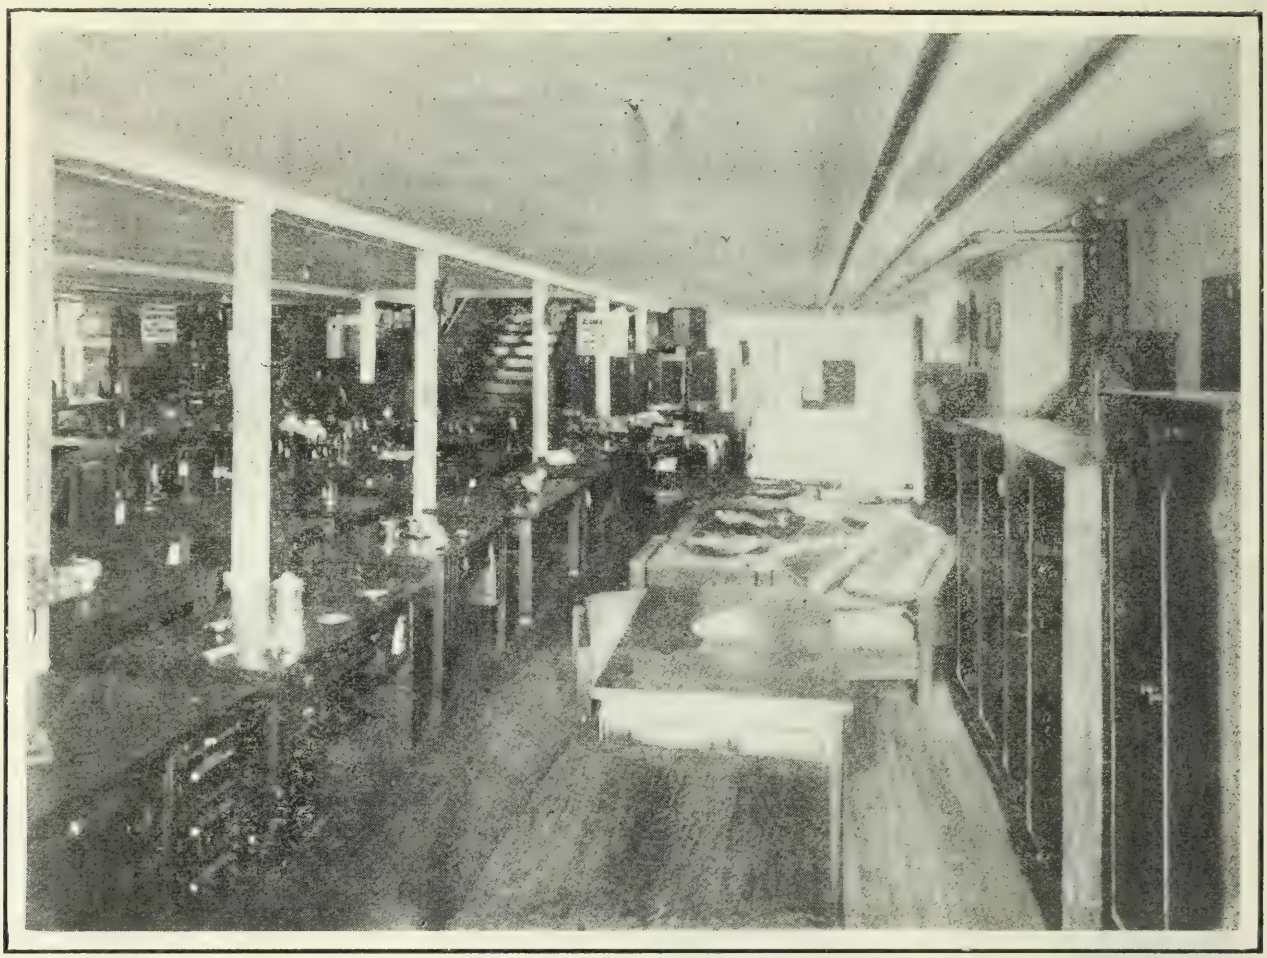
If there is any one idea that may be depended upon to find a firm lodgment in the mind of a college undergraduate it is the notion that those local merchants who depend for their business upon student patronage are a very predatory species of highway robbers. That such a conviction should exist is not surprising. Prices is a college neighborhood are usually high, for the reason that the haberdasher, the stationer, the bookseller and even the indispensable tobacco man, must provide for the running expenses of a long summer vacation out of profits made during the remaining months of the year. Likewise they must make liberal provision in their scale of prices for a goodly annual crop of uncollectable accounts, and for the other vicissitudes of trade in and about academic precincts. No ordinary advance on cost, therefore, will suffice to put a balance on the right side of the ledger under such conditions.

A little over thirty years ago, in the spring of 1882, a couple of Harvard students with an eye to the earning of honest dollars, decided that this was a situation which might be turned to profitable account. Accordingly, when college opened one autumn, they stocked their room with notebooks, stationery and other articles and proceeded to demonstrate one way by which the high cost of living might be reduced. The venture succeeded, and as others desired to share in the profits of the enterprise, a coöperative society was organized. The original membership was small; but in the course of a few years business operations were extended and more students were admitted. Once on its feet the society began to make progress and soon outgrew the capacity of a dormitory room. Larger quarters were then secured in Dane Hall and for nearly twenty years the Harvard Coöperative Society conducted its steadily increasing business there.



In the earlier years of its existence the society had no capital and was able to buy on limited credit in small quantities only. But as time went on a portion of each year's profits was set aside for the purchase of goods. New departments of business were added, regular clerks were engaged to take the place of the student help formerly employed, a delivery service was established, and the general direction of the business was entrusted to a paid superintendent under the supervision of a board of directors elected each year by the members of the society. Once again, however, the trade outgrew its quarters and in 1903 the officers of the society purchased the four-story building in Harvard Square, commonly known as Lyceum Hall. Lyceum Hall is one of the oldest buildings in Cambridge, and it is not a handsome one by any means. But the officers of the society have not deemed it prudent to spend much money upon improvements, for it is expected that, within a few years this structure will give place to a new one. In the same year the members secured a charter of incorporation.

Altho only members receive dividends, trade is carried on with students who are not members, and with the general public. Prices are the same to all, but each member, on joining the society, is given a num-



ber, and whenever a purchase is made this number is recorded. At the end of each year these are totaled up and it is upon this total that a dividend is paid to him. For the last three years the annual dividend has been nine per cent. on all purchases and the total amount paid in dividends during this period has been about $55,000. The society's membership is now a little less than three thousand and its total volume of business for the last twelve months was $393,121.19, of which a little more than half was with members.

The Harvard Coöperative Society maintains two stores, a main store in Harvard Square and a branch store on Massachusetts avenue. There are seven departments of business at the main store, books, stationery, men's furnishings, tailoring, athletic goods, furniture and fuel. The branch store carries stationery and periodicals only. The largest department of the Coöperative's business is the book department with an annual turnover of about $100,000, which means the handling of about 80,000 volumes per year. The stationery and men's furnishings departments come next in volume of business, each having annual sales amounting to about $80,000. The stock-on-hand averages about $100,000, and the number of employees in the two stores is now seventy-five. Each department is in charge of an expert, who does the buying for his department and who also controls the selling end of it.

A notable feature of the society's operations is its unusually low ratio of expenses to sales. Last year the total expenses of conducting business,

THE MAIN STORE OF THE HARVARD COÖPERATIVE SOCIETY
The building is that of the old Cambridge Lyceum, and stands in Harvard Square. On the right appears the side-wall of College House, one of the older university dormitories.

AN ACTIVE DEPARTMENT; STUDENTS' FURNITURE

Everything from a Match-safe to a Book-case in many sections is on show here, and if the Coöperative Store hasn't what the purchaser is looking for, he receives an order on a wholesale establishment in Boston, from which he picks his article and has it charged on his "Coop" bill.

including all the usual allowances for depreciation amounted to less than $60,000, or a little more than fifteen per cent. of total sales. The gross profit was a little over twenty-one per cent. of sales, so that even with a very moderate advance on cost there was a good margin of net profit. This low expense ratio is due in part to the policy of rigid economy pursued by the directors, but in part also to the small expenditures for advertising and the insignificant losses thru bad debts. The society advertises only in the college publications and the entire annual outlay for this does not exceed $2000. For the past year, in a business of nearly $400,000 only $38.34 was written off the books as uncollectable. This is because all student accounts are protected by bonds.

Modern methods of scientific management, including central control of merchandising, the use of departmental expense budgets, and the other arrangements that make for economy and efficiency in retail trading, are used in every branch of the business. Two years ago the university authorities appointed the Coöperative Society their general purchasing agent. All routine university supplies are now purchased in this way and as a result marked economies have been secured not only in the way of reduced prices, but by a standardization of the paper and other supplies annually used in large quantities by the college.

In the scope of its operation the Coöperative Society has become much the largest retail concern in the vicinity of Harvard Square and probably the largest in Cambridge, a city of over 100,000 population. Its growth has not prevented the increase of ordinary retail stores in

the neighborhood; these are much more numerous now than they were three decades ago. At the same time it has rendered a useful service in keeping the general level of prices within proper bounds and thereby protecting thousands of Harvard students against that régime of shopkeepers' extortion which usually characterizes life in a college community. The fact that nearly half its business is done with customers who are not members, and who therefore are not attracted to its counters by the expectation of dividends, is a sufficient proof that the coöperative stores manage to hold their own with competitors in the matter of regular prices and service. On the other hand, these stores have never pursued a policy of selling goods at cost or at an inadequate rate of profit. With the exception of the special markdown sales to which every business house must at times resort to clear off old stock, no merchandise is ever put on sale except at prices which suffice to cover both expenses and dividends. But by buying in large quantities at favorable turns in the market these selling prices can often be placed at a rock-bottom point. Indeed, it is the aim of the society not only to give its own members the usual retailer's profit in the form of dividends, but by combining the whole purchasing power of the student body to secure all their supplies for them at a lower initial cost. This is, and ought to be, the real goal of coöperative distribution. Its endeavor should be not only to eliminate all the price additions which mark the progress of merchandise from producer to ultimate consumer, but also to secure, thru a policy of placing large orders directly with the manufacturer, a reduced cost of production.

Coöperative stores, following more or less closely the Harvard plan, have been established at several other American universities, including Yale, Princeton, Wisconsin and California. In none of these institutions, however, has the volume of sales developed to anything like such large proportions and in none of them has the business been so thoroly organized on a scientific basis. All of them, however, have proved distinctly successful and their success affords presumptive evidence that retail business on the coöperative plan can probably be conducted, under tolerably favorable conditions. quite as well in this country as in Great Britain, where the policy of coöperative mercantile distribution has, up to the present time, found a much wider place in public favor. Two of three important things must be looked out for, however, if a retail coöperative enterprise expects to keep out of the hands of a receiver. In the first place, as the experience of the Harvard Coöperative Society has proved, no mercantile establishment of whatever organization or purpose can carry on a large trade without some capital. This does not mean, of course, that capital must be subscribed at the outset. But the coöperative business which pays out all its annual profits in dividends and neglects to hold back a fair reserve each year is reasonably certain to reach the end of its tether in a very short time. Distributive coöperation is business, not philanthropy, and to be successful it must observe the recognized rules of every-day business. In the second place, there must be continuity of policy. If the customers of a coöperative store are permitted to reconstruct the board of directors and change the management every time they feel dissatisfied with any feature of the business, there will be no development of sound mercantile traditions and, in the end, no dividends for anybody. If it is to be efficient and successful, coöperative trading must borrow two features from joint stock organization, namely the creation and maintenance of an adequate capital or reserve, and the policy of continuity in management. The Harvard Coöperative Society owes its success to a recognition of these principles.

Cambridge, Mass.

Microscopically Invisible Parasites of Disease

By Leonard Keene Hirshberg, A.B., M.A., M.D.

A generation has grown to manhood, since Pasteur, Koch, and the other pioneers of bacteriology, first brought to bear what has since become conclusive proof that the many infectious and contagious ailments that afflict man and brute are due to those ubiquitous, microscopic plants called bacteria.

The discoveries of germ after germ in the early eighties of the last century followed like the rain of shot and shell upon the Turks by the Bulgarians, so rapidly in fact that the last strongholds of benighted prejudice and misguided opposition were soon beaten down before the indisputable proof of that disease was in great part due to microbes.

First the causes of anthrax, then typhoid, and in turn tuberculosis, pneumonia, glanders, erysipelas, and most of the commoner maladies yielded to the tireless industry and painstaking researches of the indefatigable and practical laboratory workers. Like the murdering mists of the rock bound coasts, which disappear in the light of the noonday sun, just as the electric glare of the street lamp eliminates the footpad and the highwayman, so the gloomy dungeons of disease were penetrated and exposed to the light of reason, as one bacterium after another was brought before the gaze of the scientific world.

Time passed, however, and the bacteriologists were soon brought to a pause. The stone wall of human and animal ailments, caused by other than plant microbes, seemed to bring the savants up quite abruptly. No matter what they did or how they turned; no matter how many gelatin flasks or test tubes of blood serum were inoculated with suspicious material from malaria, tropical dysenteries, miner's anemia, relapsing fever, and many other acute and chronic infectious troubles, no further progress could be made.

From about 1895—the period that inaugurated the birth of such boons as the antitoxin of diphtheria and lockjaw—bacteriologists of marvelous skill became numerous in every town and village of the civilized world, yet their further contributions to the new knowledge, the microbic causes of disease, were sporadic, that is few and far between. Instead of hearing the name of a new bacillus every week, it came to be a noteworthy thing for newspaper attention if one was hurled in the teeth of the scientific world in a month, a season, or a year.

True enough, Dr. Laveran, a French Army surgeon, had already in 1880 observed certain non-bacterial parasites in the red-blood corpuscles of malarial soldiers in Algiers, but his recognition of them as non-vegetable or animal parasites induced few investigators to seek for similar causes of other little understood maladies.

The lull or hiatus in this fertile and untrod field of virgin territory lasted, however, but a moment. Soon discovery followed discovery with kangaroo strides. Seven-leagued boots could carry us scarcely faster than the laboratory investigator has conducted us since Roux and von Behring delivered us from the bondage of fatal croup—diphtheria—in 1895 with their discovery of the antitoxins. Ross and Manson's discovery of the embryonic stages of the malaria parasite in the female mosquitoes of the anpheles species; the Reed, Carrol, Lazear, and Agrimonte' demonstration of the mosquito as the source of all yellow fever; the proof by Vaughn, Hamilton and others of the rôle of the housefly in the spread of typhoid; the production by Flexner of an anti-meningitis serum; the sweeping find of Sir Almoth E. Wright that the dead bacteria of typhoid, erysipelas, pneumonia, blood-poisoning, and other common infec-

tions can be made into a preventive vaccine as efficacious as the vaccination for smallpox: these and dozens of other revolutionary blessings to mankind have followed thick and fast in the past fifteen years.

The average span of human life has, thru the scientific method, that is to say by the toil and persistence of the usually unknown, unheralded, and unsung laboratory mechanic —for the scientific investigator is a mechanic who never gets into an unthinking rut—been increased by half as much again as it was before 1895. In fact as far as infectious diseases are concerned it may be safely and conservatively maintained without fear of refutation that the man who had a probable chance a decade and a half ago of reaching thirty years of age, has a far greater chance today of reaching forty-five.

Follows now, tho, another obstacle to progress. The bacteriologist, or if you will, the microscopist of the laboratory, who was brought up pat fifteen years ago by exhausting all the yawning chasms of disease as far as the microscope—which magnifies germs 2000 times—could bring before him, was compelled to turn back a bit and seek another path to the ultra-visible by focusing a calcium light into a dark, microscopic field. At once a new vista loomed large before him. A dozen new fauna were unmasked. The spirochaete of a loathsome contagious disease was brought into the light of day, and another demon from the realm of darkness was exposed in its wicked nakedness. But much that remained hidden could not be held up in dramatic concreteness to the scorn of the otherwise doubting Thomases of a complacent world. What to do? How could the further advances be made thru the jungle of concealed miasmas and tropical pitfalls of dire and dread suffering?

Then it was that professor Loeffler in 1898—one of the great pioneers whose name will be forever linked with the discovery of the bacillus of diphtheria—in snooping about, like an Indian guide for a new trail, for an unbeaten plan of attack upon those diseases which everyone knew to be contagious, but the germs of which baffled all investigators, then it was, I say, that Professor Loeffler hit upon a method that has at last nailed the guilty germs to the mast of nearly-seen things.

On a search for the cause of the highly contagious cattle disease, known as the foot and mouth infection, Professor Loeffler gathered some of the diseased matter, serum, lymph, and pus, placed it while warm in a porcelain or earthenware cylinder, and by a pump forced the clear fluid to filter thru the unglazed ware. At once, he found that the filtrate or clear portion would cause foot and mouth disease in healthy cattle. Disappointed tho all microscopic searchers had been in their efforts to see the germs, they were confirmed by Professor Loeffler's work in the certainty that the microbes were present; but so infinitesimally small that they were far removed from all possibility of sight even when every known aid was brought to the assistance of the microscope.

This important discovery cannot be overestimated, for by this porcelain filter-plan, many maladies hitherto unfathomable have, like the little mouse in Alice in Wonderland, been brought under control. Eighteen diseases are known to be caused by these ultra-minute organisms far beyond the present threshold of microscopic visibility. Moreover, there is one—the micro-organism that causes pleuro-pneumonia in cattle — that proves the case for the prosecution. This parasite is just beyond the frontier of dark-field illumination and a 3000 time magnification of the microscope. How is this known? Well it is all very simple.

After the clear watery fluid containing these invisible organisms is pumped thru the white, unglazed porcelain filters, some of it is poured into sterilized serum-gelatin. Evidently this serum-gelatin suits the pleuropneumonia parasite as candy

does a child, for lo and behold, within several days' time, you will see a tiny speck of matter flourishing like a green bay tree, right in the midst of the gelatin. This is a growing colony of the invisible germs, which by themselves unseen, have now bunched together their descendants so Ghetto-like, that a skilled observer easily sees them. It is much the same as sweeping from a mountain-top the distant foothills in search for an approaching army in time of war. With a strong binocular, you will fail utterly in finding the single scout, the half-dozen skirmishers, or even a small cavalcade. But the moment the huge, moving mass of a vast army arises above the horizon, your eyes cannot fail to remark them. So it is with these invisible microbes, in small numbers so far beyond the border zones of the best optical apparatus.

Unhappily, the scientist's technique has not yet reached such perfection that all of these may be developed upon a suitable pabulum to be seen like little regiments. For the present we must remain content with the ability to transport, manipulate, and study them in their invisible solutions. The various methods of artificial cultivation need to be worked out. Until then patience must not surrender to skepticism, nor cease to be one of the scientists' greatest virtues.

The almost fabulous power of some of these unseen germs is so tremendous that one fifteen thousandth of a drop of a filtrate of a two and one-half per cent solution of the virus of infantile paralysis will cause the disease in a very small monkey. Even much less lymph from a diseased cow will cause an epidemic of foot and mouth disease in the finest cattle kept under the cleanest and most sanitary conditions. The blood of a rooster that has been taken sick with chicken plague may be diluted and weakened one million times with water and yet produce the plague in the finest and strongest of Plymouth Rocks.

There are five human affections whose germs or viruses—a name used to mean undiscovered parasites—are out of the scientists' visual bounds. These are rabies or hydrophobia, yellow fever, dengue fever, typhus—not typhoid, the commoner ailment—and infantile paralysis or poliomyelitis. Fourteen others are infections of domestic animals which also occasionally infect man. Only one disease with a filterable virus has been uncovered in plants. It is a malady of the tobacco plant called the "mosiac malady."

The causes of foot and mouth disease, rabies, horse-sickness, cattle-plague, cow-pox, sheep-pox, hog-cholera, chicken-plague, and the others may be finally assigned to either or both the bacteria or the animal germs, but only this much is now probable, to wit, the parasite of pleuro-pneumonia of cattle leans toward the vegetable microbes, while that of yellow fever acts in a way analogous to the protozoan animalcules of malaria. Like the latter it lives its infant cycle of existence in the blood of the mosquito, hence it may be finally expected to take its place near that group of micro-organisms.

Finally the little group of genii, who work their magic within the secret portals of the Rockefeller Institute laboratories, namely Drs. Reyton Rous, Rufus I. Cole, Simon Flexner, I. Murphy, and Alexis Carrel, have succeeded in finding that many malignant tumors of chickens and mice, vicious growths that play the same fatal rôle with these animals that cancer does in the human species, those patient seekers after unknown truths have found that when such cancers are squeezed thru porcelain filters, the watery filtrate is equally capable of becoming the fountain head of a similar fatal tumor. In other words, Dr. Peyton Rous and his coworkers have succeeded in showing that there is a filterable virus which originates fowl and rodent cancers.

Very often the approximate relations of the various sizes of these unknown germs, may be roughly es-

timated by the degree of permeability of the earthenware pores, thru which they are filtered. Those that pass thru thick, coarse filters are of course larger than the ones that slip easily thru the invisible pores of finer texture. The bacillus of influenza and the bacterium of Mediterranean fever are among the smallest visible parasites, and these are undoubtedly visible with the dark-field and ultra-violet ray microscopes, but barely to be seen with the microscopes that multiply objects two thousand diameters.

Thus it may be seen that these strange and tantilizing yet ultramicroscopic demons may flourish by the millions in the saliva, blood and stomachs of mosquitoes, bed-bugs, fleas, ticks, flies, and practically any sort of insect. The only bright spot that they leave upon the horrible picture of terror and destruction that is wrought in their depredations, is the coldly comforting fact that if you are ever so unfortunate as to be attacked and recover from the ravages of their infections, these ultra-microscopic parasites leave you forever immune to any similar trouble. That is, all but hydrophobia, and if this is not anticipated by the Pasteur preventive vaccine, you do not live to be immune, for rabies kills exactly one hundred in every hundred who are attacked.

Baltimore, Md.

Men We Are Watching

By a Washington Journalist

Brigadier-General McIntyre

The more one regretted the transfer of General Edwards from his position at the head of the Insular Bureau the better pleased he was with the announcement that the post would be filled by Col. Frank McIntyre, who was promoted to the rank of Brigadier General. Everyone says the best for which he can find words of General McIntyre. He is a big-hearted, broad-minded, clean man, a thoro gentleman and a brave soldier. He has been well tested in every capacity and has not been found wanting. No one who knows him wonders that everyone likes him.

General McIntyre's training has been an ideal preparation for his new position as military head of our insular affairs. He was born in Alabama forty-seven years ago and entered the Military Academy in 1882. When he graduated he was assigned to the 19th Infantry at Fort Brown, Texas. He is also a graduate of the Infantry and Calvary School in the class of 1889. From boyhood he was an almost instinctive mathematician, which held so good later on that he was for some time (from 1890 to 1894) instructor in mathematics at West Point. During the Spanish war he was with the 19th Infantry, in the Porto Rican campaign; and on the signing of the protocol he was detailed to the staff of General Henry, as Inspector General. Afterward he acted as Adjutant General in the Department of Porto Rico and performed various other duties connected with the government of Porto Rico, while it was under military jurisdiction. Later he went with his regiment to the Philippine Islands, serving there from 1899 to 1902. He was Adjutant General of the Island of Cebu, remaining there till the final surrender of the insurgent forces. In 1903 he was made a member of the General Staff and in 1905 assigned to duty under General Edwards in the Bureau of Insular Affairs.

His intimate acquaintance with the islands and the eminently satisfactory way in which he performed the duties of his last office (as second only to General Edwards) make his appointment as head of the Bureau most acceptable not only to the people of the islands but to all who have their best welfare at heart.

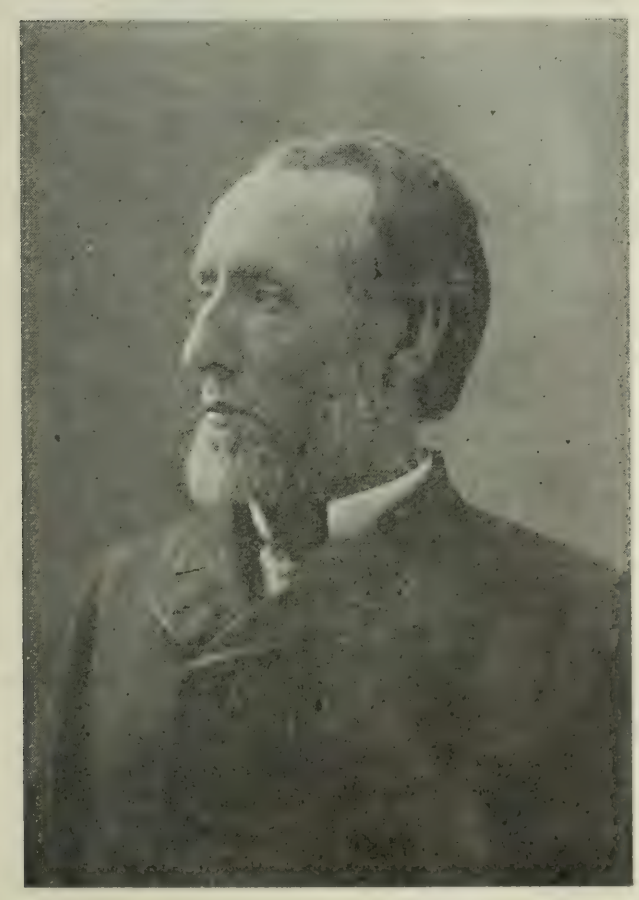
General McIntyre carries his years and honors lightly. He is too emphati-

FRANK McINTYRE
Brigadier-General, U. S. A.

cally modest for one who is his friend to venture to say all that one would of him, personally; but every one who meets him realizes a most agreeable companion, democratically cordial, always approachable, never autocratic. Those who know him better know an entertaining conversationalist and a thoroly honest man, sincere in his friendships and fair in any opposition. Those who know him best find a big-hearted, sympathetic, loyal friend.

His executive and administrative ability have already been thoroly tested and we may congratulate our Insular Possessions that in losing General Edwards they have gained General McIntyre, while we all wish him long continuance at the post.

Senator Cullom



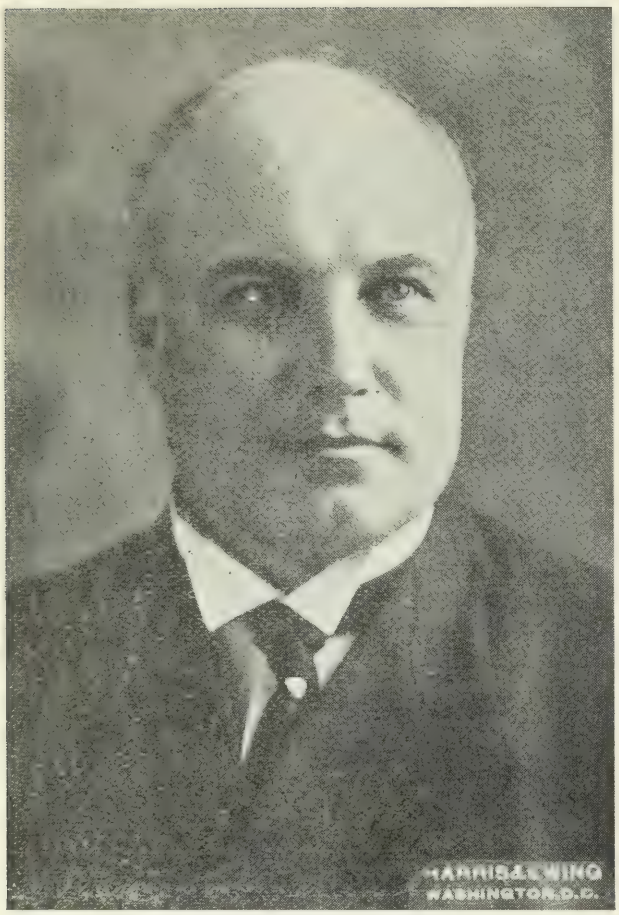
The undisputed veteran of the Senate, Shelby M. Cullom, is a man from whom we cannot easily take our eyes. Not today, but before these lines are printed—on the twenty-second of December—he will pass his eighty-third birthday. He is still *in* the Senate—not simply a member of it. Not a man there is more punctual, constant and devoted in attendance. Not a Senator is better informed in public matters or a more earnest advocate of measures for the public good. One may well wonder if Illinois does not already regret that in, perhaps, a thoughtless moment, she turned him down and that his final term expires next March. The Nation regrets it.

Senator Cullom entered Congress when President Lincoln entered the White House. They were firm friends in advance. Lincoln read law with Cullom's father. Excepting the time he was Governor of Illinois, Cullom has been in Congress ever since. With the close of his term, next March, he will have served his country constantly for sixty years; far outrunning the record of any other man in our history. That he has served faithfully is evident not only in his record, leaving his name without one blot, but in these days of "perquisites" it is forcefully indorsed by the fact that while he came to Congress with a small fortune, collected in the practice of the law, he goes out as poor as the proverbial church mouse; after sixty years of "opportunities" such as have not often tempted even successful politicians. Not a loyal American but will say "Well done, good and faithful servant," and perhaps that is all that Cullom cares for. He will find us saying it yet more earnestly when he is out and we realize the power for good which he still is, in spite of his weight of years.

The cause of universal peace and international arbitration never had a more earnest advocate and few men have done more to further it than Cullom in his position as chairman of the Foreign Relations Committee of the Senate. He will be more missed from that position than from any other. The cause of real arbitration will suffer a severe blow when

Cullom has to quit his post. Eight years ago, long before President Taft's broad views of arbitration were broached, Senator Cullom said, publicly:

"I do not consider it visionary or too long a look ahead, to say that the time is coming when not only civilized nations but *all* nations will be in a compact to take not only judicial questions to the supreme court of nations for settlement and to abide by the verdict. It will not infringe upon national rights and policies any more than our individual rights are now infringed upon. It will not weaken and obliterate the nation any more than it weakens and obliterates the man. But wars will cease unto the ends of the earth and the nations will remember the advent of the arbitration treaty as the final blow to the relic of barbarism bequeathed to us by our ancestors." But for the short-sighted opposition of two Republicans Senator Cullom would have accomplished the ratification of the first two ideal arbitration treaties (with France and England) during the last session of Congress.



SHELBY M. CULLOM
Retiring United States Senator from Illinois.

Though eighty-three years old Senator Cullom is as clear, clean-cut and shrewd a political leader as can be found in the Senate and one of the most delightful men to meet who ever emerged from the Chamber. In face and figure, mind and bearing he strikingly resembles President Lincoln, even to his way of speaking and his quick wit and responsive anecdote. His unconventional courtesy and ever ready sympathy are all in keeping with that ideal. He is tall and slender, with white hair and beard, showing his age in body but not in mind. It will be a great loss to the Senate and the Nation when he is forced to retire.

Commissioner F. K. Lane

When the Interstate Commerce Commission was established there was considerable opposition and more speculation, and for a time its duties were so restricted and its powers so limited that it failed to make the most favorable impression as an aggressive institution. But the men behind the guns—the commissioners—were not there as figure-heads. They took every bull which they could reach by the horns and instigated Congress to give them a wider reach. When Congress took the hint, and saw how effectively each enlargement of scope or power was utilized, it changed its policy and has almost overwhelmed the Commission with duties and responsibilities. It is not to Congress, however, but to the commissioners themselves that we owe the powerful hand which to-day curbs the avaricious tendencies of interstate commercial agencies. It would have been much easier to have allowed the Commission to remain in innocuous desuetude. It is such men as Commissioner Lane and his comrades who render government by the people effective.

Commissioner Lane is an excep-

FRANKLIN K. LANE
Member of the Interstate Commerce Commission.

tional man from any viewpoint. As a boy he was counted a prodigy and he has never outgrown it. He is distinctively of the kind that pushes—he sets his mind on the desired end and then attains it. Obstructions only mean to him a better chance for exercise. He was born in Prince Edward Island, some forty-seven years ago but—aggressive from birth — he learned to walk in California; and he has been a stalwart Californian ever since. California is particularly proud of him, with good reason. He is a lifelong Democrat, but was appointed to the commissionership by President Roosevelt when he determined to make the commission a force which should be felt, by placing on it men who could push. He made a good selection in Commissioner Lane, and has been reported to have said that he considered it the best appointment of his administration.

Barring religious views, which have nothing to do with the case, the Commissioner is very strongly of the Bob Ingersoll type, mentally, physically, and characteristically. He has the same big, healthy, vigorous body; the same big head, with intelligence standing out all over it; the same bold forehead and square jaws; the same keen, quick clear eyes and firm mouth, set in a face that is readier to smile than frown, but capable of either if the case demands. He has friends everywhere because every one who knows him is his friend—sometimes in spite of vigorous antagonism; for he is a hard but a fair fighter. He tells a mighty good story and appreciates a good one when he hears it. But his concentration, his persistent scrutiny, and ability to solve intricate problems and qualities which have rendered him an ideal man for the position which he holds. His shrewd insight combined with an unswerving inclination to be fair have rendered him one of the best feared as well as best respected among men. He is doing great work on the Interstate Commerce Commission, appreciated as much by the carriers and by the carried.

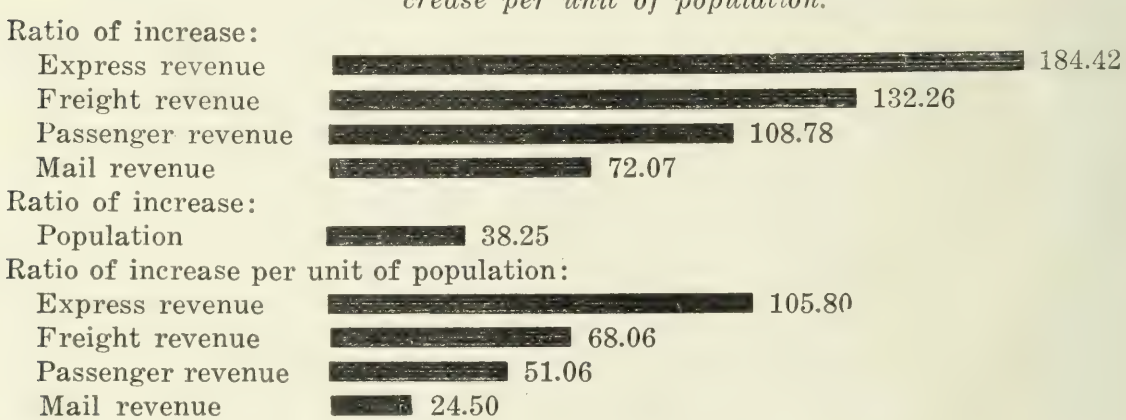
The Federal Hand On Express Business

By Franklin K. Lane

Commissioner of Interstate Commerce

The Hepburn Act, of 1906, brought the express companies of the United States under the jurisdiction of the Interstate Commerce Commission, and since that time the Commission has made a most exhaustive investigation into the rates, rules, and practices of the companies.

The magnitude of this work can scarcely be imagined. There are thirteen express companies doing an interstate business in the United States. The more important of these are the Adams, American, Wells Fargo & Co., United States, National, Southern, Great Northern, Western, Globe. Last year they transported over three hundred million packages. They operated over 218,013 miles of steam railway in this country, over 18,385 miles of steamship lines, and 6,665 miles of electric lines. They paid to carriers for transportation $69,730,895, and their own expenses, so far as could be ascertained, arising out of their immediate functions as express companies, amounted to $64,305,590. This will suggest something of the task laid upon the Commission when it is remembered that now, for the first time, the express companies were brought under Federal attention and that, with the exception of a few States, their immediate business had never been the subject of direct governmental attention. Neither should it be forgotten that there is little in the way of foreign experiment to act as a guide; for the express business is an American invention. Nowhere but on this continent does the express company, as we know it, exist.



In other countries the railroads cover the transportation, leaving to what is called forwarders to collect and distribute the packages. In America the express business began with one man carrying a carpet bag, paying his railroad fare between Boston and New York, accepting personal responsibility for the transportation and delivery of such small packages of unusual value as he could conveniently carry. From this beginning, with no great outlay of initial expense, as a rule, there has developed the gigantic system; an institution of great importance to the country, but living by the grace of the railroads, with an existence which is only justifiable to the extent that the service rendered is more efficient and more reasonable than that which would be given by the railroads themselves.

The great companies which have developed from the man with the carpet bag are separate legal entities, but it is of interest to regard the fact that by stock membership and otherwise they are so interlaced, intertwined, and interlocked that it is with difficulty that we can trace any one of the companies as either wholly independent in its management or as the agency of a single railroad system. The Adams and the Southern are very closely affiliated. The American Express Company is the second largest stockholder in the Wells Fargo and Company. The largest stockholder in Wells Fargo & Company is also the largest stockholder in the United States Express Co. An interesting genealogical tree might be drawn showing a common ancestry of all the larger companies. Many names may be used to designate these companies, but it is within the facts to say that aside from the operations of minor, distinctively railroad express companies, the express business of America is managed by not more than three groups of interests.

While the companies operate separately, and compete with each other for traffic, the express business may nevertheless be said to be almost a family affair. For many years the country was parceled out between the

great companies. There was, for instance, an understanding that Wells Fargo & Company should not extend its business east of the Mississippi, while the eastern companies should leave that territory to the Wells Fargo & Co. The New England States, to-day, roughly, the territory of the Adams and American companies, etc. Thus affording an opportunity for great variation in rates and regulations and making thoro investigation and adjustment the more difficult. Nor was it a matter open to consideration from any arbitrary standpoint. The institution was of too great importance to the whole country, as is shown in the following diagrammatic chart giving the results obtained by a comparison of the revenues of the railroads from freight, passenger, mail, and express service between the years 1893 and 1910, and further comparison of the increases of revenues for the respective services with the increase in population during the same period:

Percentage of increase of revenue received by railroads from transportation of express, freight, passengers and mail from year 1910 over 1893; also increase per unit of population.

This is further illustrated by the fact that since the Civil War, so far as our researches have extended, no express company in the United States has been forced into bankruptcy. Express companies have risen and fallen in this period, but evidence tends to justify the conclusion that the death of an express company has always been the result of a change in policy by a railroad.

A careful study of the express situation in this country brings us to the conclusion that there is but one proper view to take of the matter. The act to regulate commerce imposes obligations upon all railroad carriers. The rule applies to parcels as to car loads. The act also by name recognizes the express company as a carrier subject to the jurisdiction of the Interstate Commerce Commission. We must regard these great forwarding companies as agencies created by the railroads and recognized by law for the conduct of a certain kind of freight business, to which these agencies have added a service that is distinctly and peculiarly their own. The traffic which they move should flow with the greatest possible celerity between all portions of our country, and whatever artificial barriers have been raised by the existence of separate express companies should be broken down, and the rates made and the practices followed should neither rest upon the foundation of a railroad's preference or of an express company's opportunity.

Numberless complaints were lodged with the Commission against various features of the business, but were finally grouped in eleven classes as the foundation for investigation. These evils were so fundamental that it was necessary not only to criticise and correct existing rates, but to build up from the very bottom by outlining a national system of stating rates, a national classification of ex-

press freight, and even to enter into the minutia of the billing, routing, and other details. Complaints came from all parts of the country alike. The same evils apparently existed everywhere. It would be impossible to go into all of the details of the investigation and of the ways and means to obviate the different evils, but among the most important measures was the unification of the method of stating rates. In this, especially, simplicity is the ultimate essential.

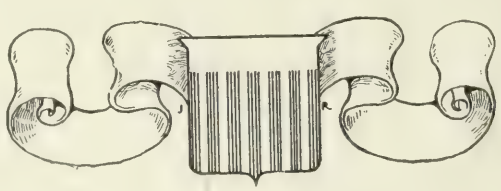
Instead of becoming more and more involved in classification, rules, and rates, as has been the tendency with the increasing business, there must be a complete reversal of policy if the express company is to avail itself of its opportunities. Neither shippers nor expressmen know the express rates of the country. Not even experts can be certain that the rates they quote are the lawful rates, so many are the conflicting rules, and routes and scales in operation. We must have a simpler method of stating rates; one that is understandable; one that will prevent the discrimination which is certain to exist so long as there is indefiniteness and ignorance.

There are some 35,000 express stations in the United States and the complicated methods required over six hundred million statements of rates to cover them. The ordinary express agent was lost in an effort to find a rate. With files of all the tariffs of all the express companies at hand the trained clerks of the Commission find it difficult to determine the legal rates applicable to shipments moving between two points, especially when there are several possible routes and transfers. It is small wonder that many over charges and under charges and discriminations result. The loss of time, the loss of revenue, the lack of efficiency resulting from the present system are incalculable, in addition to all of the causes for complaint which have occurred.

For these six hundred million rates we propose to substitute a rate system based upon a division of the country into 950 blocks, each block the square formed by one degree of latitude and longitude. Each block will be numbered and the numbers applied in such a way that the tens in the numbers indicate the perpendicular line and the hundreds indicate the horizontal line in which the block is to be found. For example, 1724 is at the crossing of the seventeenth horizontal and the twenty-fourth perpendicular lines of blocks. We propose to require that the carriers publish schedules to apply from each block to every other block; so that an agent located in any block need only to find in which block a point of destination is located to turn at once to his schedule, reduced from six hundred million to 830 statements of rates to learn exact tariff to the point desired.

The application of this would obviously be unjust in two adjoining blocks, as the points of origin and destination might be close together only across the line; so that between adjoining blocks another schedule is prepared, each block being divided into smaller blocks, on the same system. In another schedule the rates will be prepared in respect to weight, so that by a moment's study any shipper can discover for himself precisely what the rate will be for his particular package to any point desired.

After careful study this seems the best and the only means of arriving at some established and universal system. If we are to base a rate upon the value of property used (and certainly this is a primary consideration) we must consider not alone the express company's property but the property of the railroad which is used in giving the greater part of the service; and once this is done it is evident that all of the estimates of the monumental earnings of the express companies based upon their investment in property are misleading. The real asset of an express company is the contract which it enjoys with a railroad company. It has the monopoly in the carrying of small packages on the passenger trains of the railroad, but it



has no more of a monopoly than the railroad itself has. It has no right to impose unreasonable rates by reason of the exclusive contract which it enjoys with the railroad. It must be treated as the railroad itself would be treated.

The railroads of the United States might do all of this work without adding so much as a million dollars to the value of their equipment. Indeed many of the express companies themselves have no inconsiderable portion of their local service rendered by local transfer companies, so that the investment or property owned may not be regarded as a basis for lowering express rates. The carpet bag has evolved into an express car and that into solid trains of express cars with the expenditure of an inconsiderable amount of money on the part of the expressman. Outside of the money which has been made in the express business a million dollars would doubtless cover the original capital of them all. The companies have bought their office buildings, stocks, and bonds out of the profits which they have made.

When we realize that this branch of the railroad business has been conducted practically without regulation for half a century and that its business is of such vast proportions that the additional charge of one cent per package would today yield the companies a revenue of three million dollars a year the opportunities which they have had to grow in wealth are manifest. The profits of an express company depend largely upon the contract which a shrewd agent is able to make with the railroad. There can properly be no relationship whatsoever between the capitalization of an express company and its rates. A just and reasonable rate must include a return to the express company which will compensate it with a profit for the expense of the service which it gives including the proper charge which it may reasonably make for the service rendered by the railroad.

There is no doubt but that the express company can expand by the utilization of its organization into a still more useful agency than it is today. It can absorb more or less of the heavier freight business of the railroad to the advantage of the public. It can effect a combination of the freight and express service giving a lower rate than the express rate and a faster service than the freight. The test of the express company as a public utility is at hand. It is not deniable that the express company has, to no slight degree, lost the confidence of the people it serves. That the institution is of great service is abundantly evident. That grave wrongs have crept into the system became immediately apparent the moment the Commission began investigation of the complaints which reached it. There must be many changes made before the institution becomes what it should. There must be unity, simplicity and efficiency. But there appears no valid reason why the express companies should not accomplish this and become an invaluable resource in American industries.

Washington, D. C.

Uncle's Gift

By Elizabeth Abbey Everett

The day I was twenty-one my Uncle Sam offered me a farm for a birthday present. I had not finished my education and I didn't think much about the gift then, especially as he said the offer would hold good until I married.

Uncle Sam is my uncle on my father's side. He has never shown much confidence in my mother's business management, nor, in fact, in any of us women folk.

After I had taught a few years, I got rather tired of the confinement of the schoolroom and began to realize, as most teachers do at some time or other, that though teaching looks, at a distance, very profitable, in reality it does not give much opportunity to secure a competence for one's later years. Then I began to think with interest of Uncle's offer.

He is generous in a way, but he has some frugal ideas. He always told us frankly that he was not giving us the land to speculate with, and he seemed afraid that we would not appreciate the value of the gift. So the chief condition he made was that we should live on the land for five years and improve it, before he would give us our deeds to it. I should have said before that he had made the same offer to all his nieces and nephews, except that he said nothing to the boys about withdrawing the offer when they married. But that is quite in accord with Uncle's ideas.

Sometimes Uncle is better than his word. When Cousin Jack came back after three years' service in the Philippines, he accepted Uncle's offer. But he had lived on the farm he selected only two years when he received a deed to it. Uncle likes to encourage patriotism, and he said that anyone who was brave and devoted enough to fight for his country ought to be encouraged. So he deducted the term of Jack's service from the five years he required of the rest of us. He offered to do the same for Cousin Jerry if he would serve in the navy, but Jerry preferred to stay on land.

It happened that brother and Cousin Caroline had chosen adjoining farms. They got pretty well acquainted, and thought a good deal of each other. Brother didn't enjoy doing his own housework, and Caroline didn't like to split kindling, so they decided to marry and continue improving their farms together. But when they spoke to Uncle Sam about it he said he was willing, only they would be one family then, and would need only one farm. They might choose either one they wished, but they could have only one. They decided to wait and not marry until they both had their farms, but they seemed to feel a little hurt and thought that Uncle Sam was rather parsimonious.

And really, you know, he does seem that way sometimes. He has let the people who work for him bamboozle him most shamefully, and some of his prosperous relatives have worked him to a finish. Every once in a while he seems to wake up to the fact that he is being tricked. That makes him suspicious of the others, and he imposes very hampering restrictions on some of his poor relations, often on those who are trying hardest to please him. I will say for Uncle Sam that I think he is better to his poor relations than anyone else I know of, and he is very generous about adopting anyone who asks, and he tries to give them all an equal chance, but he is too lenient, and lets selfish people abuse his generosity; then he turns severe, and it isn't always the guilty ones who suffer. He is fair-minded, tho, in this way: to those of us who did follow out the rules he laid down for us he gave the farms he had promised willingly, but you know it is a little irritating to have to conform to a lot of pernickety regulations when you see other people disregarding real essentials and getting the same benefits.

Of course these criticisms are all in the family. I notice that a good deal of the grumbling about Uncle Sam that is indulged in is just a sort of mild enjoyment of a family privilege. I must admit, tho, that it is rather bad manners.

Personally I've found Uncle a very pleasant old gentleman. I've got pretty well acquainted with him thru trying to understand what he wanted me to do. He is always interested in education, and very generous in helping it on. He is public-spirited, too, and he has given a good deal of land and money at different times to induce companies to build railroads into unsettled parts of the country. Sometimes, it is true, his benefactions have seemed rather ill-advised, but he meant them well.

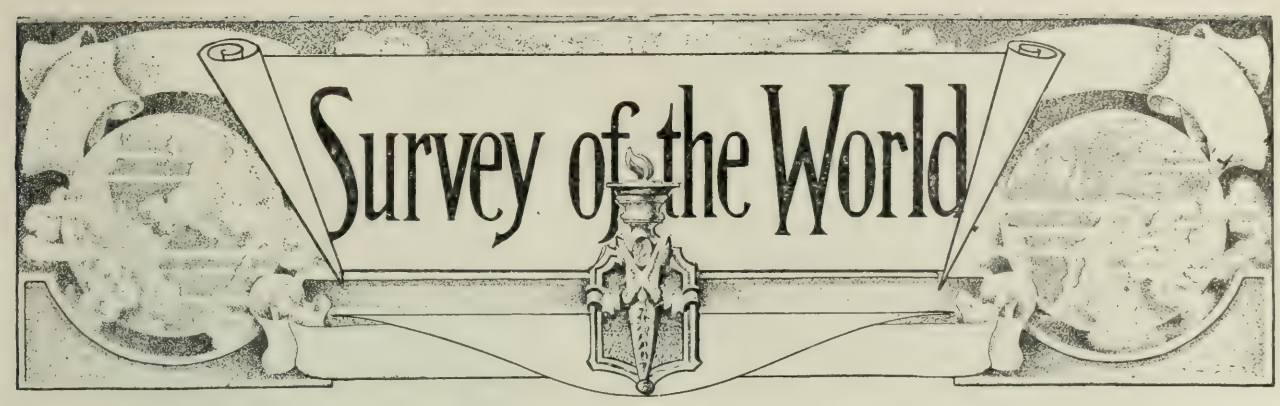
He is very fond of trees, too, and has planted a good many in different parts of his estate, and works very hard to prevent fires among them. He is planning to do a lot more planting, and he told us when we choose our farms that if he decided to turn that part of the estate into woodland he wanted to reserve the right to do so; but, in that case, he would let us pick out a farm somewhere else in exchange for ours. There are some of his nephews who have used this generous offer really to swindle—well, I won't criticize, since it is all in the family. He used to be very free about making gifts of valuable timber lands, but I guess he is learning a thing or two.

He has always been very careful about giving away mining land; when he gives any of his relatives a present he always mentions that he is giving it to them to encourage an interest in farming, and if they find gold or any other mineral on it before he has actually given them the deed to it he expects them to tell him and give the land back. But that is fair enough.

In fact Uncle Sam is fair and generous; at least I have found him so. And, while we are talking about it, it occurs to me that my Uncle Sam is your Uncle Sam, too. Why don't *you* ask him for a farm?

Berkeley, Cal.

A Voice in the Night



By Frieda R. Grieder

Oft in the midnight watches
  A voice comes, seeming to say—
"My daughter, my daughter, why standest thou
  So heedless here by the way?

My children cry from the city,
  My children cry from the plain,
My daughter, my daughter, why standest thou
  Deaf to the great world's pain?

My children moan 'neath their burdens,
  They fall 'neath their weight of care.
My daughter, my daughter, why standest thou
  Unwilling their burdens to share?"

Dubuque, Iowa.

Non-Inflammable Films

The chief reason why the cinematograph has hitherto failed to take its destined place as an amusement in the home and a means of instruction in the school-room is the inflammability of the strip of celluloid from which the photographs are projected. Upon this film is focussed the light from a powerful electric arc and if it is by any chance stopped for a few seconds it may be set on fire by the intense heat and burn with almost explosive violence. The reason of this is that celluloid is composed of gun cotton and camphor, and contains sufficient oxygen of its own to support combustion so it will continue to burn in an atmosphere of carbon dioxide or when water is thrown on it.

As now made celluloid is much less dangerous than formerly, and it is likely to be replaced at least for the "movies" by a new compound, acetyl celluloid. This contains the acetyl instead of the nitro group and is made by the action of acetic anhydride, the most concentrated form of the vinegar acid, instead of nitric acid, upon cellulose, that is the fiber of cotton, paper and wood. Most of our explosives, nitro-glycerine, gun cotton and smokeless powder, are nitro compounds, but the corresponding acetyl compounds of cellulose are not explosive and rather less combustible than wood or paper. It is said to be equally suitable for photographic films and not much more expensive.

The Sanity of Farmers' Wives

It has been the fashion to say that farm life was so burdensome and so lacking in social relief that the farm wives were crowding our insane asylums. We have recent reports from two of these asylums, one at Binghamton, New York, and the other from Orange County, and here are the figures. Between January first, 1903, and April first, 1910, out of five hundred and forty-three patients fifty-five per cent. came from three large towns and less than forty-five per cent. from all the villages and hamlets and farm sections together. Out of a total of sixty-four committed for delirium tremens there were two farmers and two farm laborers. Dr. Woodman says that the pathetic accounts concerning farmers' wives driven by hard life to insanity or suicide are imaginary. Only two farmers wives are found in a group of thirty-seven, and in both of these cases farming had been given up some time previous, and the women with their families were living in villages. We hardly need to record the fact that farm life at the present time has less of isolation and less of unrelieved labor than any town or city occupation. The free mail delivery and the rural telephone unite to brighten the most hidden homestead, and to bring into social relations the most scattered populations. Our farmers buy and sell by telephone; and our farmers' wives visit by telephone. The country is lonesome only to those who do not know anything about vegetable life or animal life, and this can easily be acquired by mothers and daughters. The herd instinct belongs only to the very cheapest class of untrained minds.

Opium Prohibition in China

The systematic suppression of the foreign opium trade in China has resulted in the accumulation of large stocks of the drug which have been mortgaged to eleven banks in Shanghai. Indications of the complete stop of opium trade in China are evident. The alarmed English traders have asked their government to compel China to admit the drug, and in consequence the British minister has warned China that unless the Chinese Republic intends to observe the agreement of 1911 providing for the total prohibition of cultivation and a diminishing import, he will advise his government to take some definite measures. Theodore C. Taylor, a member of the House of Commons, protested against this as unreasonable and remarked: "We have tried to persuade ourselves, but we shall not succeed in persuading either China or the rest of the

world that we are helping her to get rid of the opium curse by forcing it upon her." On account of the surveillance of the Chinese government, the English opium traders have had to smuggle the drug into China from India. Dr. George Berlotte, a French correspondent who had been in the Chino-Indian frontier for several months, said that regular pitched battles were fought between the volunteers of the Chinese republic and a large number of hired coolies who have assisted the opium smugglers for many years. He also said that the customs officers under the British authorities were aiding the smugglers and were fighting the Chinese troops. Poppy cultivation in China is decreasing, altho not altogether abolished. Dr. Paul L. Corbin, a missionary for many years in Shensi, the largest poppy-cultivation province, said that he was surprised at the wonderful decrease of the poppy cultivation in that province, and that much of the land has been used for wheat raising. It is to be hoped that the injustice of the Opium War of 1839-1842 may not be repeated, and that England now will aid China in removing this curse of humanity instead of forcing it upon her for the benefit of the revenues of India.

The Spiny Anteater

The Zoological Society of London has just received living specimens of one of the most curious and primitive mammals in the world, the Papuan spiny anteater or echidna. The common Australian echidna is well known, and may be seen in the Bronx Park Zoological Gardens, New York. It, with the duckbill, represents the lowest type of mammals, the Prototheria, whose young are born within eggs, speedily hatched. The echidnas are small creatures, not larger than rabbits, have long, flexible snouts, and many stiff spines scattered thru the coarse, blackish hair of the coat. The New Guinea form, however, presents several distinctive peculiarities. It stands upon relatively tall legs, much bowed, and has a nose longer than the head, which together give it a comical likeness to a diminutive elephant. A large number of the spines are white, mottling the coat most curiously. An especial peculiarity is the fact that the toes vary in number in different individuals, from three to five, and those of the hind foot are long claws. These hind legs are so strangely jointed that the creature can scratch not only its head and forequarters, but along its spine even to the root of the tail! This tail, by the way, is triangular and long enough to be habitually used as a support for the body. The animal's gait is more like a turtle's than a mammal's, and many features of its structure are reptilian. The mouth is a small slit at the end of the "trunk," and the principal food is

THE PAPUAN ECHIDNA

earthworms, but one having been caught must be moved about until it can be seized by the end, when it is suddenly drawn in by a kind of suction. The echidnas are burrowers, which explains the absence of external ears and the minute eyes.

Electricity at Cost

The government of the Grand Duchy of Baden, the most progressive of German states, has just advertised for bids for the construction of an electric power plant which will furnish electricity at cost price practically in all parts of the state. The power will be drawn from the Murg River, well known for the romantic beauty of its valley to all tourists of the Black Forest. It sheds its waters into the Rhine below the city of Rastatt. As electricity is needed for the illumination of the stations of the state railways as well as by the Upper Rhine Railroad Company in Mannheim a sufficient demand is assured from the start to place the enterprise on a paying basis. The initial expense of installation will not exceed $2,500,000. It is expected that especially the smaller workshops and home industries, as well as the farmers, will avail themselves of the advantageous opportunity of obtaining cheap electricity. It has been shown already by practical experience that, by bringing cheap motive power to every single home, even in remote villages, domestic industries which were already at the point of being stamped out by the competition of the large manufacturers have been wonderfully revived. The social value of this result for the preserving of an independent middle class and for counteracting the tendency to

leave country life for the large cities is easily seen. To meet the danger of bureaucratic management ever present, especially in Germany, the state officials will divide the control of the enterprise into a board of directors composed of representatives of the great construction concerns of industry, commerce, the technical professions and agriculture.

The Aeroplane in War

It is an unfortunate feature of our civilization that a new invention is not likely to receive encouragement from governments except for military purposes. Mankind is slow to pick up a new tool unless it can also be used as a weapon. The conquest of the air has been undertaken almost solely with an aim to the conquest of the land. There has been much speculation as to the possibilities of using flying machines in war, but 1912 is the date of the first actual employment of the "Fifth Arm." It has so far proved itself an eye rather than an arm. Except for the Italian aviator who scared the Arabs in Tripoli by swooping over them and the Greek aviator who rained bombs out of heaven on the streets of Janina, no material harm seems to have been done to the Ottoman cause. But three aviators on the side of the allies have lost their lives during "The Thirty Days' War" in the Balkans. A Bulgarian lieutenant in trying to reconnoiter Adrianople was killed by the failure of his monoplane, and later a Russian aviator lost his life because his machine took fire while in the air. But the most remarkable flight was that of Dr. Constantin, a Frenchman, who was fired upon while taking photographs of the Turkish fortifications from above. His biplane was riddled with bullets and he received a fatal wound, but kept his hand upon the wheel until he landed inside the Bulgarian lines dead.

The usefulness of the aeroplane for scouting purposes has been demonstrated in the Balkan war and indeed is evident to a layman on inspection of the accompanying

PHOTOGRAPHED FROM AN AEROPLANE

View of the railroad yards at Mustafa Pasha, the first station beyond the Bulgarian border on the line to Adrianople.

THE LONDON PEACE CONFERENCE

This photograph of the representatives of Turkey and the Balkan States was taken at Stafford House, London, where they were entertained before the conference Seated from left to right: Venezelos (Greece); Nikolitch (Servia); Novakovitch (Servia); Mioutchkovitch (Montenegro); Daneff (Bulgaria); Madjaroff (Bulgaria); Reshid Pasha (Turkey); Popovitch (Montenegro); Vesnitch (Servia). Standing to the left of the center row Skouloudis (Greece); second man in the center row on the left Lord Haldane; center of center row Germadius (Greece); next is Sir Edward Grey; then Premier Asquith, who stands on the right of the center row, with Mrs. Asquith on his left.

photograph taken above Mustafa Pasha, the first Turkish town captured by the Bulgars. The view shows the switching arrangements of the Bulgarian transportation system, the great V which serves as a turntable for the trains, and the plains stretching toward Adrianople with sufficient clearness to dispose any body of troops in the vicinity. It would be hard to steal a march upon a general who has eyes so far above his head.

The Peace-Makers

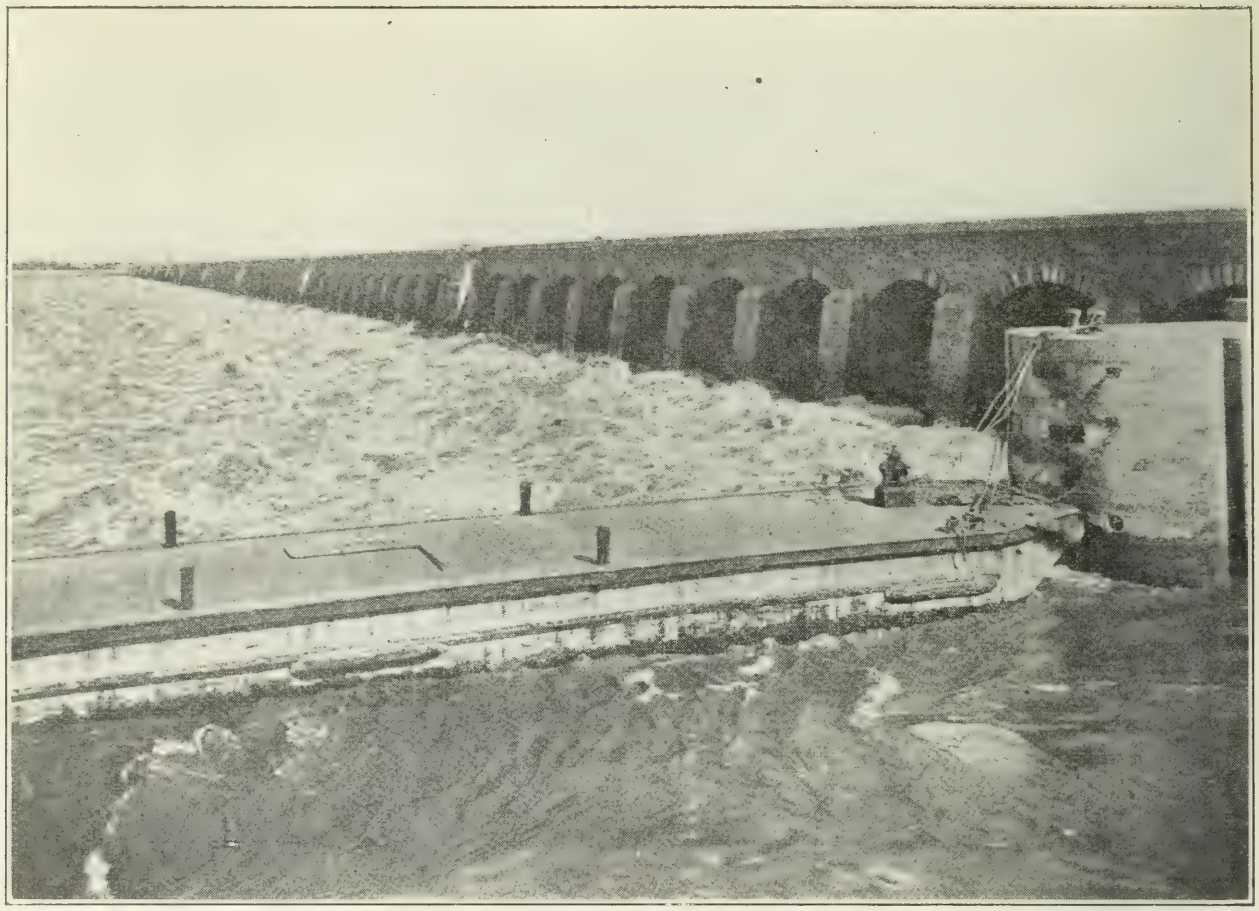
If the plenipotentiaries now meeting to arrange terms of peace do not accomplish anything it will be because of lack of personal ability, for the Porte and the four allied Balkan kingdoms have sent to London their most competent men. The Greek delegation is headed by Eleutherios Venezelos, who is credited with having accomplished the supposedly impossible task of bringing the rival Balkan States into agreement and coöperation. He was born in 1864 and is descended from an old Athenian family, one of whose members, St. Philothea Venezela, was beaten to death by the Turks in 1589 and buried in the Cathedral of Athens. He had been for ten years one of the leading men of Crete, when he was in 1910 called to Athens to become Prime Minister of Greece. Joannes Gennadius is 65 years old and has had a long diplomatic experience beginning with an appointment as attaché at Washington in 1871 and continued at Constantinople, Vienna and London. He is married to an English lady and has received honorary doctorates from Oxford and St. Andrews. Mr. Skouloudis was formerly a banker in Constantinople and in 1897 as Minister for Foreign Affairs negotiated the terms of peace with victorious Turkey. The fourth member of the Greek delegation is George Streit, of German descent, a member of The Hague Court of Arbitration and Minister to Vienna.

The chairman of the Bulgarian delegation is Dr. Daneff, President of the Sobranye or National Assembly. He is professor of international law in the University of Sofia and a member of The Hague Court. General Paprikoff was assistant to the chief of staff in the war with Servia in 1886. He has been Minister to Russia and has held the portfolios of War and Foreign Affairs in the Bulgarian cabinet. Michael Madjaroff was educated at Robert College, Constantinople. He has been editor of the *Mir* and is now Minister to England.

Servia is represented by Stoyan Novakovitch, a veteran statesman and diplomat. He entered the cabinet in 1881, became Prime Minister in 1895 and has represented Servia at Constantinople and St. Petersburg. The other Servian delegates are: Andra Nikolitch, who has been in the Government, off and on, since 1890 and is now President of the Skupshtina or National Assembly; Dr. Milerko Vesnitch, Servian Minister at Paris and a member of The Hague Court.

The Montenegin delegation consists of Lazar Mioutchkovitch, formerly consul at Skutari and in 1905 first Prime Minister under the new constitution; Mr. Popovitch,

Chargé d' Affaires at Constantinople, and Count Voinovitch, private secretary to King Nicholas.



Opposing the above mentioned is the Turkish delegation headed by Mustafa Reshid Pasha, who conducted the peace negotiations with Italy at the Ouchy conference last fall. He has in the last twenty years been in the diplomatic service at the capitals of Bulgaria, Rumania, Italy and Austria. General Salih Pasha is a cavalry officer who very curiously is serving as Minister of Marine. In 1906 he was Vali of Skutari, the town now besieged by the Montenegrins. The third member, Osman Nizami Pasha, is partly of German origin and has been since 1908 Ambassador to Berlin, where he has been received with marked favor by the Kaiser.

Sweet Clover

A good illustration of the progress of evolution in our fields, changing worthless weeds over to the list of valuable plants, is seen in the very recent discovery that sweet clover, the old New England pest, too bitter for cattle to eat, and hard to eradicate where it had a hold, has almost suddenly become one of the most highly valued of all our legumes. One of the Agricultural College reports states it strongly that there is not one clover in our fields of more value for hay, nor any other so good to turn under for green manure. It comes next to alfalfa for feed and as a pasture is way ahead. On poor land it shows its most valuable characteristic. Where there is almost no humus sweet clover will make a good stand of pasture, and if taken with other grasses will constitute as good a pasture as can be had by the fourth year. The bitter taste, while at first objectionable to cattle, indicates the presence of cumarin, which is a preventative for bloating. Here we have one of our most troublesome weeds, not only lifted out of the rank of pests, but transferred by careful experimentation, which constitutes the new farming, into one of our most valuable foods and fertilizers. It is a good New Year's note. It looks now as if Nature were a book with only a few leaves open.

A BY-PRODUCT OF WAR
A Turkish Cholera Camp in the Field.

THE ASSUAN DAM

On December 23 Lord Kitchener inaugurated the new dam at Assuan which by raising the level of the storage reservoir doubles the area of land to be brought under cultivation by the waters of the Nile collected at this point. In this way it is hoped to relieve the fellahin of the burden of labor and want which they have borne since the days when they were forced to erect, in honor of their oppressors, the monuments at Philae now covered by these beneficent waters.

Philae and the Assuan Dam

The great Assuan dam over the Nile, 350 miles from Cairo and just north of the first cataract, was completed a decade ago according to the original plans. Its utility in conserving and distributing the waters of the Nile was at once evident and the great prosperity of Egypt in recent years has largely been due to that undertaking, the greatest of its kind in the history of the world. The original dam was an immense wall of masonry 130 feet high and about one and a quarter miles long. An army of toilers had been at work at it for years and it was completed at a cost of about $7,500,000 even in that land of cheap labor. But with the utility of the original dam so apparent it was natural that an attempt should be made to increase its efficiency by adding to the height of the dam and accordingly 26 additional feet of masonry have been added to the structure, making the barrier to the waters of the Nile about the same height as the falls of Niagara and increasing the capacity of the reservoir about two and a half times and enabling the Egyptian Government to irrigate an additional 1,000,000 acres of desert land and make it blossom as the rose. As the climate of the Nile valley permits two or three crops a year, with moisture now assured and the power of regulating at will the waters of the great river to which Egypt owes its fertility, the future of this historic land agriculturally will probably surpass its past of two thousand or more years ago when Egypt was the granary of the world. That such an improvement is the legacy of Lord Cromer's rule in Egypt is certainly a matter upon which England and the world in general may be congratulated.

But there is a serious drawback to this great undertaking and to the satisfaction with which it is contemplated as one of the modern wonder of our utilitarian age. That drawback is the practical submergence of Philae and its wonderful ruins of ancient Egypt. This, in part at least, was foreseen at the beginning of the great enterprise and called forth vigorous protests on the part of the lovers of antiquity. But it was pointed out at the time that the ruins, while they might be damaged to a slight extent and the beauty of their setting somewhat impaired, would not be submerged except at their base, and as the utility of the irrigation plans was so obvious the protests of the lovers of antiquity were disregarded. In his book *La Mort de Philae* Pierre Loti, in particular, with his characteristic vividness and wonderful charm of style deplored

the ruin that was being wrought in the name of progress at the beautiful island of Philae, crowned with its nine temples devoted to Isis. Until the flooding consequent upon the completion of the dam in 1902 these temples were regarded as the most beautiful and inspiring relics of Egyptian art and architecture. George Birdwood in a letter to the London *Times* last October bewailing the approaching submergence of Philae wrote as follows:

The Parthenon, Philae, and the Taj Mahal, taken with their surroundings, are the three most enchanting "beauty spots" in the world. * * * There is not much in the architecture of the Temple of Isis and less in its paintings; but that palm-tufted Dfgiret el Bisbe and its grouped columns of the Greek and Roman periods, set like an emerald in the golden silence of the most spiritual and spiritualizing stretch of scenery in the whole length of the Nile within its historical course, would not permit me to prize the Parthenon before it, and certainly not the Taj Mahal. But to engineers nothing is sacred.

The first result of the flooding of 1903 was to destroy at once this view of such surpassing loveliness and historic and spiritual charm. The palms were the first to disappear at once and forever, for they were killed by the action of the water upon them. As the impounded waters crept up the walls one after another of the ruins disappeared or left only here and there a column or some highest part of the structure alone to indicate where the temple had stood. Now that the great dam has been completed by a great addition to its height nothing will remain above the waters except, perhaps, the roof of the main temple, the upper halves of its two pylms and the highest part of "Pharaoh's Bed." Philae, in short, will be buried under the waters of the Nile and only in the latter part of the summer, at a time when few tourists ever visit this part of Egypt, will the lowness of the water in the reservoir again permit the temporary emergence of the ruins covered with silt and slime. The beauty of the famed landscape and the still more famous ruins will shortly and forever disappear.

Some years ago when the additions to the dam which have since been added, were proposed and the final ruin of Philae was clearly foreseen, Richard Croker suggested that New Yorkers buy them and transfer them to Central Park, but there was no response to a proposal which involved innumerable difficulties and an expense which could not be calculated closely enough to bring the scheme within the realm of the practicable. It is possible that had the engineers been duly impressed at first with the importance of preserving the ruins they might have done so at considerable trouble and additional expense. But, unfortunately, ruins were simply ruins to the engineers and not to be considered in comparison with the convenience to be obtained by ignoring them. This is to be regretted, but regrets are unavailing and Philae as it has been known to civilization for centuries may now be considered as buried beneath the waters of the Nile. It stood in the way of the needs of the present and of modern progress and it was inevitable the latter should triumph. H. F. SUDDUTH.

The Color of Children's Eyes

The eye colors of man fall in two main classes—blue and brown. Blue eyes are without brown pigment in the outer surface of the iris. Scattered thruout blue eyes are small granules which reflect the light just as the motes in the atmosphere reflect light. This reflected light appears blue to us both in the eye and in the air. In addition there occurs in some, if not in most eyes, a varying amount of fat pigment in the form of yellow specks. This yellow mixed with blue gives the green or green-gray eyes. Other eyes are flecked with fine brown pigment so diffusely as to give the hazel color. When this flecking is more intense and the pigment occurs in patches the eyes appear mottled. There are three main types of mottled eyes. The mottling may take the form of a ray or fan spread out from the pupil to the outer edge of the iris on one or both eyes. Or the blotching may occur in a ring pattern surrounding the pupil and covering a variable surface of the iris. This pattern, too, may occur in one or both eyes. Finally the blotching may take the form of larger or smaller spots situated anywhere on the iris. This blotching occurs not only on blue or gray eyes, but may appear even on brown eyes; the pattern being made of a different, usually darker, shade of brown.

When the whole iris is pigmented the eye is brown or black, depending on the density of the pigment.

Now those various conditions of eye color have definite behaviors in heredity; a fact that we have discovered only in the last five or six years. We have long known that we cannot make something out of nothing, but we did not know that the rule held in regard to the eye color of our children. Hence blue eyed parents have often hoped, in vain, for brown-eyed children. Since blue and probably gray eyed parents have no brown pigment in the outer surface of the iris they cannot transmit brown to that portion of their children's eyes. This absent characteristic may be one that has been lost or it

may never have been acquired. It is known in hereditary language as a recessive. Hence, to repeat, two recessives produce in their offspring only their recessive condition.

The hereditary behavior of brown eye color, however, is very different. In brown eyes actual pigment occurs in the iris. Here there is something accumulated to hand on down to subsequent generations. The amount that can be transmitted, however, depends on one's own hereditary history as well as that of one's consort. If both of Smith's parents belong to brown eyed strains then Smith can have only brown eyes. And since Smith has been given, as it were, a double dose of brown his eyes will be dark brown. Smith will have, in his turn, only brown-eyed children whatever may be the color of his wife's eyes. In the language of heredity Smith's brown eye-color dominates over blue or gray. When Smith's brown eye-color has been derived from one parent only, then his own eyes will tend to be lighter in color and only half of his germ-cells will have the potentiality for making brown eyes. Hence, if he marries a blue or gray eyed wife, only half of his children will have brown eyes—and a light brown, too, because of two generations of dilution. In case Smith's wife, also, has brown eyes derived from one of her parents only, then three out of four of their children will have brown eyes; but only one of the three will get a double dose for brown; hence Smith's brown-eyed children will not all transmit brown in the same degree.

Thus it is possible for a brown-eyed parent to have one-half or one-quarter of his children blue or gray eyed. But it is never possible for two blue or gray-eyed parents to have brown-eyed children. The exceptions that are sometimes brought forward to this rule concerning blue or gray occur only when one of the parents, at least, has mottled eyes. In other words, the dominance is so imperfectly expressed that the judge has put the eye in the wrong category. In such cases the true nature of the eye is best demonstrated by its hereditary behavior. We do not know enough yet about the behavior of mottled eyes, whether rayed, ringed or blotched, to make very definite statements concerning them; but the evidence so far gained seems to show that the brown spottedness dominates, even over uniform brown, when the spots are of a darker shade than the ground color of the iris. Concerning the behavior of differently colored eyes, for example, one brown and one blue or gray, we know little more than that the trait is handed down in some families.

Literature

The New Realism

A little over two years ago, six teachers of philosophy at Harvard, Columbia, Princeton and Rutgers joined in issuing thru the medium of the *Journal of Philosophy and Psychology* a manifesto in behalf of a coöperative method of philosophizing, and of a philosophic creed of Realism as against Idealism. The present volume*, written by the same gentlemen, is the first fruits of fulfilment of the original brief "Program and Platform." No one, whatever his own bias in philosophy, is likely to deny that the volume "makes good" as evidence of the value of coöperative discussion and writing by a group of like minded thinkers. It is not to disparage any one of the six writers to say that the present volume is probably both more interesting and more weighty than would have been a volume of the same size written by any one of the six alone. The various contributors have their distinctive aims and prepossessions, and each has written *con amore* and succinctly of that which is closest to his own interest. The reader gets the advantage of condensation and of freshness of point of view and theme as he passes from one essay to another. The underlying unity of thought distributed thru the variety of treatments makes for a definite reinforcement and solidity of conclusion. Probably the rather unusual clarity of style—in view of the technical difficulty of many of the points discussed — owes something also to the mutual exchange and criticism of ideas involved in such an undertaking.

**The New Realism, Coöperative Studies in Philosophy.* By Edwin B. Holt, Walter T. Marvin, William Pepperell Montague, Ralph Barton Perry, Walter B. Pitkin, and Edward Gleason Spaulding, New York: The Macmillan Co. Pp. xii, 491.

It must also be said that the authors have been very successful in avoiding the chief pitfalls of the enterprise. In advance one would fear a tendency to slip too easily over debatable points, lest some serious disagreement be revealed by minute consideration; and a tendency to forced agreement for sectarian reasons. The individuality and candor of the authors have amply protected them from both these dangers. They have even set forth in a brief appendix some of their divergencies of position regarding one of the most fundamental points in a realistic theory, the nature of consciousness.

Judgments as to the success of the book with respect to the other matter at stake, the exposition of a coherently Realistic philosophy, will naturally vary with the philosophic standpoint of the critic. The standpoint must have become a very fixed bias, however, if it entail inability to recognize that the volume clarifies the points at issue and gives the most authoritative statement of the New Realism that has anywhere yet appeared. The book is certainly likely to remain for some time to come the point of departure for all discussions of realism *versus* idealism.

Earlier in the history of this movement, the present writer in common with some others, queried how far the New Realism was to be more than an anti-idealism — just what would remain as its positive content, for example, if its assault on idealism were so successful as to wipe out that philosophy. The present volume sets that query at rest. In dealing with certain difficulties that present themselves in developing their method of constructive statement, the various writers have advanced sundry hypotheses which are well worth discussion on their own account when one puts the idealistic controversy out of mind. There can

be no doubt of the right of the group to call their philosophy a *New* Realism. It varies radically from the Scotch common sense realism, and markedly, tho less radically, from the metaphysical realisms that branched off from Leibniz's monadism. It has resolutely t u r n e d its back on all representative theories of knowledge—those which hold that we know things only thru the intervention of sensations and ideas as direct objects of knowledge, and is making a valiant attempt to account for theories of error on the basis that all knowledge is a direct presentation of objects. It avoids the pit into which most realisms have fallen — the separation of things-in-themselves from phenomena. It approaches Platonic Idealism (as is frankly recognized) in attributing "full ontological status to the things of thought as well as to the things of sense, to logical entities as well as physical entities," ascribing even physical efficiency to mathematical-geometrical characters like planes, angles, numbers, ratios, etc., which the older realists are generally content to describe as conceptual abstractions.

So far as method is concerned, nothing is more striking in the book than the use of the newer mathematical logic, sometimes called logistics —tho not of course of its technical refinements and vocabulary. This leads the writers to a pluralism, approaching metaphysical atomism, which would certainly provide a fundamental issue to be discussed even if all philosophers were converted to some form of realism. The supposition of a Universe of Being of entities and relations within which the physical and the pyschical world are simply designated sections, created difficulties before which even Plato finally retired helpless. It will be interesting—to use a mild term—to see if the advance of science since Plato's day has provided a means for separating logical and mathematical elements and relations from physical, and at the same time for combining with them and intersecting them. A demonstration of this—which is thus far assumed as warranted by physical science but not subjected to theoretical development or analysis —would be a constructive achievement compared with which the nullification of idealistic epistemology would be a secondary achievement. In the course of their papers, Drs. Holt and Pitkin both advance certain hypotheses—as hypotheses—highly important in themselves and fraught with immense significance for psychology and possibly for other branches of knowledge.

The reviewer has his own personal reserves and queries regarding many points in both the method and the conclusions of the New Realism. He welcomes the book, none the less, as a solid contribution to American scholarship and an exceeding stimulating intellectual performance whether critically or constructively viewed. It is to be hoped that the wish expressed in the preface that the present volume be soon followed by other collections of studies be speedily realized.

JOHN DEWEY.

Japanese Landscape

The popular school of Japanese painting, which produced the charming color-prints that have fascinated so many artists and art lovers of the Occident (Ukiyo-ye, the Japanese term them, "Pictures of the Passing World," that is, of common things and every-day life) this Ukiyo-ye school delivered its last message of beauty in the landscapes of Hiroshige, who was born in 1797 and died in 1858. After him came the deluge of deterioration. Several thousands of color-prints bearing the signature "Hiroshige" have come out of Nippon, but they have shown such uneven merit, such differences of style and even such divergence of signature, as to constitute a most puzzling problem for the collector. Edward F. Strange in his book on *Japanese Illustration* (1898) surmised that there must have been two artists who

used the name Hiroshige. In his second edition (1904) he listed not two but three Hiroshiges who designed color-prints. Six years later Herr von Seidlitz (*History of Japanese Color-Prints*) made light of this by saying that the change in signature from the Japanese cursive to the Chinese square style gives no warrant for such a supposition, and that the change in the painter's style is sufficiently explained by Hiroshige's increasing age and the progress of the times. In a footnote, however, he credits to "J. S. Tapper" the discovery of a second Hiroshige "of minor importance." Arthur Morrison, whose monumental work *The Painters of Japan* (1911) is the most authoritative and illuminative treatise in any language on this subject, agrees with Strange and says that Ichiyusai Shigenobu, who was a pupil of Hiroshige the great, signed himself as Hiroshige II only after the death of his master in 1858. He abandoned both name and calling soon after 1863. The third Hiroshige, who probably took the name as an aid to the marketing of his vastly inferior work, lived until 1896. The researches of Mr. John Stewart Happer, who possesses what is probably the largest extant collection of Hiroshige prints, have resulted in the interesting discovery that most of the best Hiroshige prints bear a date seal—a cypher printed on the impressions—giving the year and even the month of their publication. The little book before us* elucidates this discovery, and gives a complete survey of all that is known of the life and work of the greatest of the landscapes painters of the popular school. It contains also a few short chapter on the "Hieratic schools" of Japanese painting, and some rhapsodical and meaningless "fine writing." In spite of this blemish it makes a strong appeal to all who are interested in Japanese color-prints. As illustrations there are excellent half-tone reproductions of fifteen prints by Hiroshige, and a memorial portrait by Kunisada, inscribed with the following quaintly beautiful little farewell poem, written by Hiroshige just before his death:

Dropping the brush at Azuma (the Eastern capital) I go the long journey to the Western Country (the Buddhist Heaven is in the West) to view the wonderful sceneries there, perchance to limn them, too.

Posthumous Tolstoy

The justification for publishing the posthumous works of Tolstoy, as of any great author, depends in each case upon the reasons he had for letting them remain unpublished. With some it is evidently because he knew they were not worth it, and only the respect a man has for his own handwriting explains why he had not long since put them out of the power of a possible public. *The Man Who Was Dead,* also translated as *The Living Corpse,* was held back at the request of the family of its heroine; the more readily, says C. Hagsberg Wright in an introduction, because Tolstoy had his doubts whether a work of art for art's sake would be a thing God would approve.[1] This would seem as if Tolstoy did not himself realize how his beliefs colored his art, for no play could make a more direct statement of one side of his social creed. A drunken spendthrift, whose one moral asset is a sort of passive truthfulness, wishes to free his good and faithful wife from the burden of his existence. He cannot utter the lies of a divorce action or commit self-murder, so he allows himself to be thought a suicide, disappears from legal existence, and becomes a living corpse. When a disappointed blackmailer tells on him to the authorities, his wife is happily married to a good man, and to his own deep disgust he has to put an end to the law's interference by becoming a corpse in reality. In other words, to solve a spiritual problem affecting individuals, he has to get out entirely from society, die to the world. The last speech

**The Heritage of Hiroshige.* A Glimpse at Japanese Landscape Art. By Dora Amsden, with the assistance of John Stewart Happer. San Francisco: Paul Elder & Co. $2.25.

[1] *The Man Who Was Dead.* By Leo Tolstoy. New York: Dodd, Mead & Co. $1.25.
The Living Corpse. By Leo Tolstoy. Philadelphia: Brown Bros. $1.

of Fedia, in which he expresses his conviction that they would all have done so well if they had only been left alone to God and their consciences, expresses even more plainly Tolstoy's own feeling as to the relation of the individual to society.

Certainly *The Forged Coupon* was not held back because it lacked moral purpose.[2] A slight sin sets going a long series of crimes, worse and worse, until just as it has reached black murder the lesson of pity and love begins to work the charm backward along the long line of peasants, small shopkeepers, landowners, schoolboys, convicts and the Czar. It is all very well to point a moral, but this drives it in with a gimlet. As for *The Light That Shines in Darkness,* the very reasons that left it not only unpublished, but unfinished, make it a precious human document.[3] Intensely personal, as intimate as a diary, it shows the family tragedy that caused and attended Tolstoy's long spiritual compromise. If, as Aylmer Maude suggests, it does not show the "other side" of Tolstoy's own nature, it shows the other side of the story—his wife's side—not without a certain rueful humor that makes the play wonderfully good reading. Here is a written chapter in the unwritten history of reformers' wives. The lack of an ending, for the last act is only sketched, and two scenes are indicated as alternative closes, shows how, even on paper, he could find no way to untie the knot that only the footfall of approaching death gave courage to break.

Literary Notes

The life and labors of a modest, devoted and effective missionary to the Indians of North-western Canada are recorded in the memoirs of the Right Reverend William Carpenter Bompas, D. D., first Bishop of Selkirk, and properly designated *An Apostle of the North* (Dutton, $1.50.) The Rev. H. A. Cody has written a vivid story in which Archbishop Matheson has supplied a short introduction.

The Poems of John Keats make their reappearance, this time in the Burlington Library (Little, Brown, $1.25) with twenty-four dainty illustrations in color, and pleasing end papers, by Averill Burleigh.

A vivid and striking as well as reliable picture of the religious, social and economic environment of primitive Christianity is given by Prof. Thomas C. Hall, of Union Seminary, in the *Historical Setting of the Early Gospel.* (Eaton & Mains, 75 cents.)

Prof. D. A. Hayes attempts to give in a short essay a concise and at the same time popular statement of *The Synoptic Problem* (Eaton & Mains; 35 cents.) The task seems almost if not quite impossible to perform, but Professor Hayes has done as well as could be expected.

The growth of humane sentiment relating to the treatment of the lower animals is briefly and modestly described in *The Humane Idea* (Boston: American Humane Education Society) by Francis H. Rowley, president of the Massachusetts Society for the Prevention of Cruelty to Animals.

The Epworth League study course is ably started by Mr. Frank Seay's *Story of the Old Testament* (Nashville: Smith & Lamar, 50 cents), which is a candid and well written primer of Old Testament Introduction, incorporating in a conservative way the results of modern literary study.

Dr. George William Douglas's *Essays in Appreciation* are, with some notable exceptions, brief notices of a eulogistic character, all excellent in tone, on persons of distinction or of distinctive work in Episcopal circles, notable among them being Sister Anne Ayres, Rev. Henry C. Potter, Rev. William R. Huntington.

Those interested in experimental psychology will find in *The Fundamental Laws of Human Behavior* (Badger, $2), by Professor Max Meyer, the mechanical methods of accounting for nervous functions and reactions carried into minute detail and made the basis of some complicated theories in regard to the laws which determine human activity.

A blasphemous, undersized, tuberculous Londoner is the pathetic hero of Alfred Ollivant's *The Royal Road.* Ground between the millstones of industry and his encroaching disease, Ted Hankey is such a one as Galsworthy loves to champion. His release from trouble is, however, gentle and happy. It is a moving story, of unequal strength, but with redeeming patches of wonderful realism. (Doubleday, $1.25.)

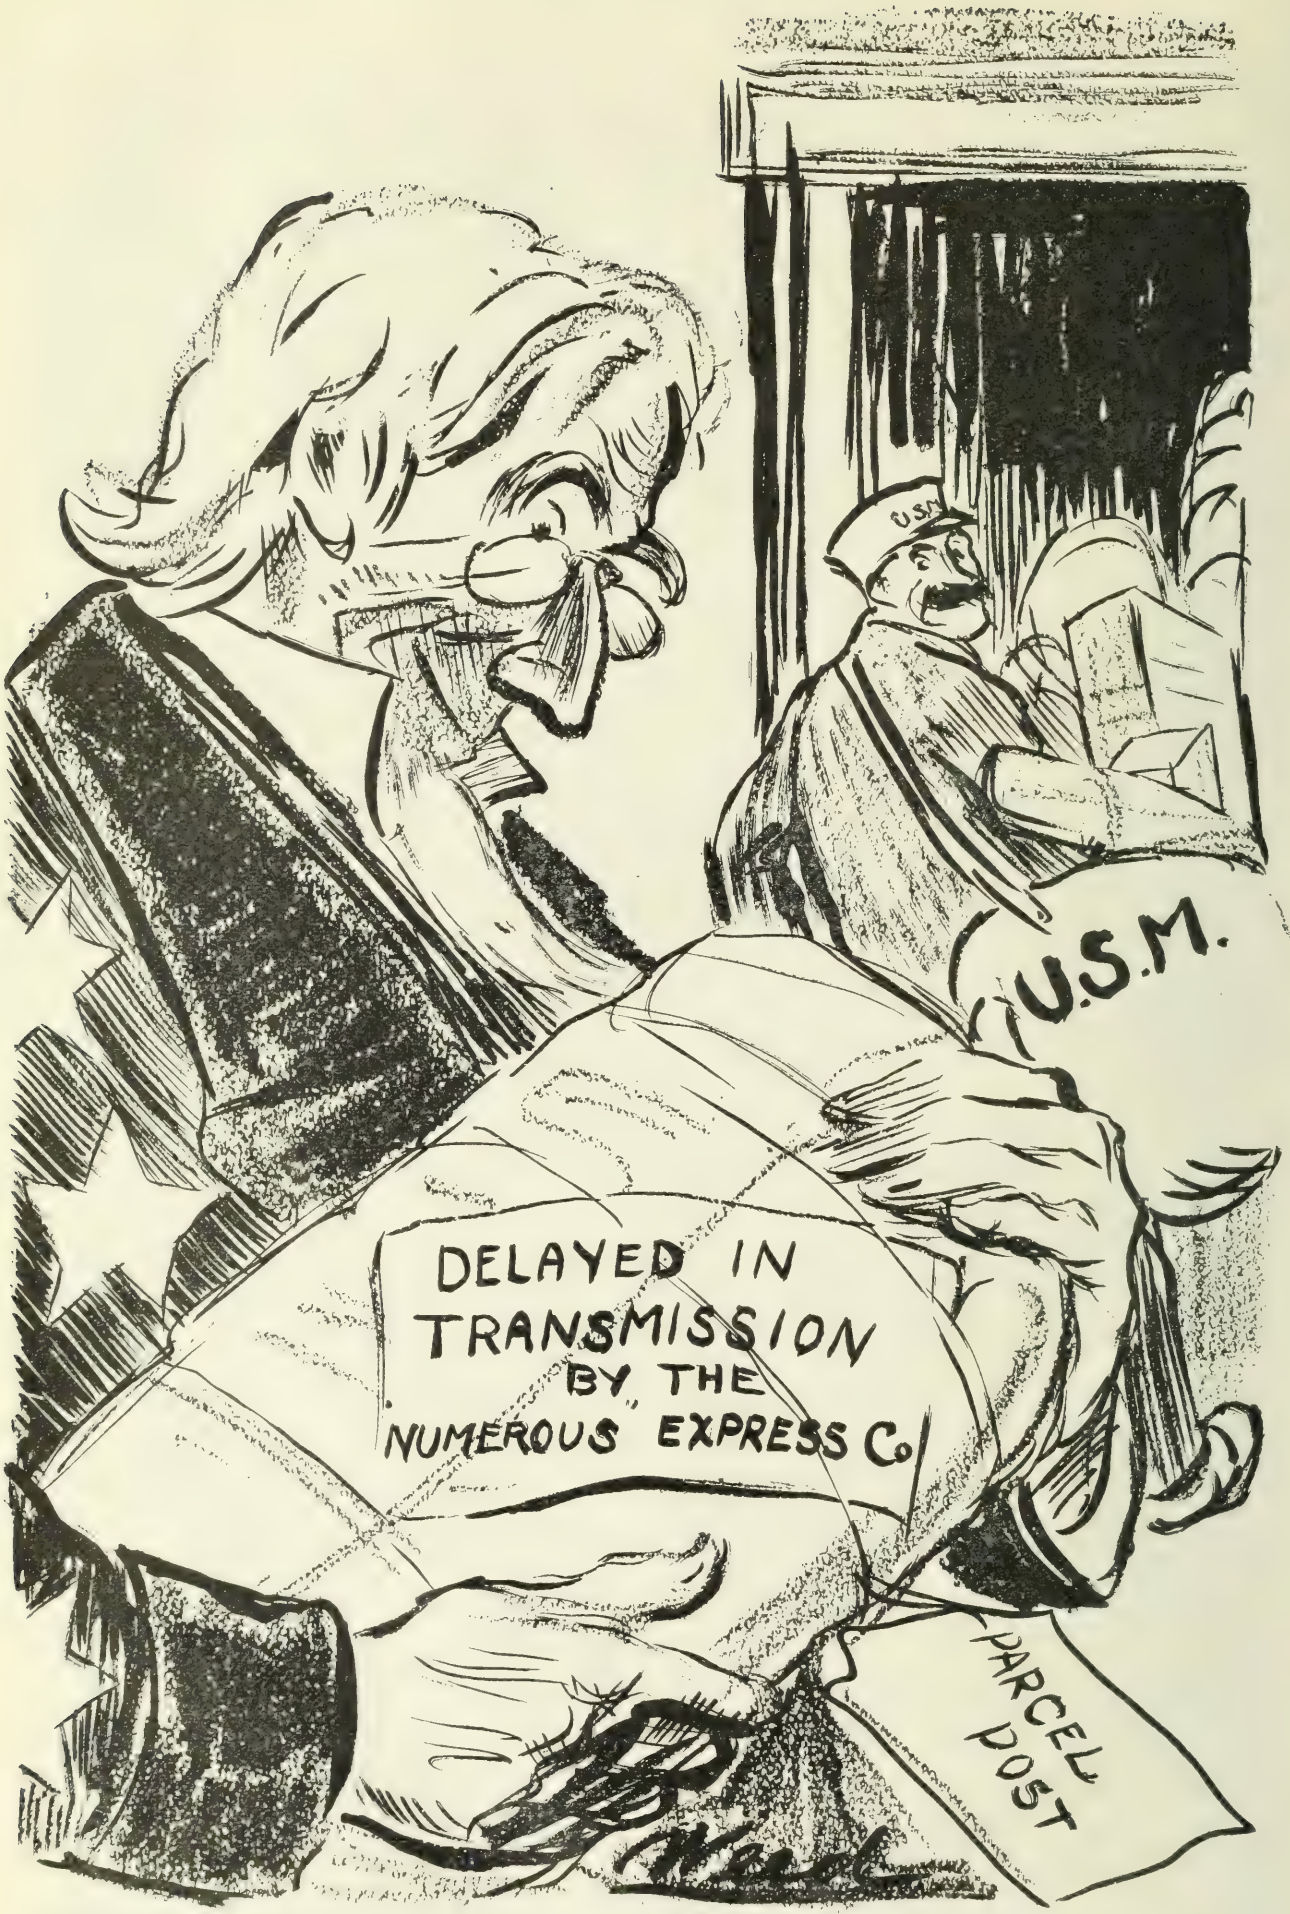
[2] *The Forged Coupon.* By Leo Tolstoy. New York: Dodd, Mead & Co. $1.25.

[3] *The Light that Shines in the Darkness.* By Leo Tolstoy: New York: Dodd, Mead & Co. $1.25.

Frederic Taber Cooper has written a companion volume to his *Some American Story Tellers* in *Some English Story Tellers—A Book of the Younger Novelists* (Holt; $1.60.) The writers whose work is submitted to his critical analysis, entertaining if somewhat superficial, are Conrad, Hewlett, Kipling, Galsworthy, Bennett, Hichens and nine others. Appended are a useful bibliography and index.

A plain, reasonable and sincere presentation of the meaning and limitations of biblical inspiration and authority is given by the veteran pastor and religious writer, J. Monro Gibson, in a volume entitled *The Inspiration and Authority of Holy Scripture* (Revell, $1.) Dr. Gibson describes his own experience in passing from the narrow and perplexing view of a generation ago into the more rational and satisfying position of today.

That the wide-awake and faithful minister should become acquainted with and not oppose or belittle the results of critical study is the well-grounded plea put forth to his fellow preachers in a booklet by Rev. George Elliott on *Biblical Criticism and Preaching* (Eaton & Mains, 35 cents.) He has also some well-directed words of caution against the notion that criticism any more than old fashioned dogmatism is worthy material for spiritual edification.



It was inevitable that an authoritative *Life of General William Booth*, of the Salvation Army, should appear, and the author is G. S. Railton, who was First Commissioner to General Booth. No one could be better able to do this work, having the aid of the General's children, who are high in the Army. The author avoids discussion of the withdrawal of three of his children from the Army, and believes other writers will be as reticent. (Doran, $1.)

Not only the kindergarten in search of music for motion games will find useful Katherine Norton's collection of little piano pieces gathered under the title *Rhythm and Action with Music for the Piano* (Ditson, $1.) It should interest any one who knows how much life may be enriched by an early cultivation of the sense of rhythm. The music, all easy to play, is intended to accompany and suggest such rhythmic motions as marching, running, or hopping, and those of sports like ball tossing and bounding, skating or swinging, the object being to lead the children to perceive and appreciate rhythm as an element in many beautiful things and to help them to gain such control of their bodies as to use it.

Four years ago Prof. A. T. Robertson, of the Southern Baptist Theological Seminary, published *A Short Grammar of the Greek New Testament*. That it worthily met a need in New Testament study is shown by the fact that a third edition with corrections and additions has just come from the press. In the meantime translations into Italian, German and French have been made and published by competent European scholars, and editions in Dutch and Spanish are soon to appear. Dr. Robertson's work lies between the beginner's grammar and the larger works by Wiener, Blass and Moulton, and brings into a small compass many of the more important results of recent investigations into Hellenistic Greek. (Doran, $1.50.)

The American Social Progress Series has received a worthy addition in Mr. R. Fulton Cutting's frank and optimistic lectures on the relations of *The Church and Society* (Macmillan, $1.25.) The author's estimate of the possibilities of the Church as an effective agent of social betterment is doubtless hightened by his own connection with St. George's of New York, where he worked for years under the inspiring leadership of Dr. Rainsford, but the various lines of effort indicated can be followed with greater or less success in every community, and his suggestions deserve careful consideration. The book ought to be freely distributed to the membership of the men's clubs in our churches, and the separate chapters would form excellent subjects for general discussion at men's meetings.

It might seem that there was no room for innovations in a dictionary of the German language, but that made by Max Bellows (Holt, $1.75) has no less than six useful original points, of which the most striking are the distinguishing of masculine, feminine and neuter genders by different types, and the arrangement of both German-English and English-German divisions concurrently on the same page. This system was followed in the recently issued *Bellow's French Dictionary*. Another feature that impresses the traveler by its practical quality is the series of tables giving equivilent values of German, British, American and French money, comparing American and German thermometer and barometer scales, and giving the American equivalents of metric measures and weights, not only exactly, but roughly, for conversational purposes. The technical terms and expressions, here brought up to date, are of especial value to those desiring to follow advances in engineering, especially in aviation, as recorded in German periodicals.

Drawn by C. R. Weed.

HIS BELATED CHRISTMAS PRESENT

Advertising Affirmations—II

By George French

The development of advertising during the past five years is one of the more notable business phenomena of the first quarter of the Twentieth Century. Nothing comparable to it is happening in any other line of business, tho something of the same spirit has invaded all progressive business.

The greatest fact about advertising to-day is that it is so strongly tending toward ethical ideals, and the most significant tendency of this large fact is that it is based almost wholly upon the truth that the "square deal" in business is proving the most potent money-making principle. In advertising, the truth is now the greatest of all shibboleths, and even those who have not yet come to the point of practising the truth make use of it as an effective postulate.

The several large and efficient national associations of advertising men are all trying to bring their membership on to a plane, and in agreement with a creed, that has as its chief article the observance of a pretty strict code of ethics. There are three of these associations, with national membership and sphere of activity. They are: The Associated Advertising Clubs of America, which now includes Canada, Mexico and England in its membership, has about 150 club members with more than 12,000 individual members; the Association of American Advertisers, made up of national advertisers; the Association of National Advertising Managers, the membership of which is composed of some 200 managers of large concerns that do national advertising.

The chief aim of all of these associations is to legitimize advertising, as a business and as an ethical element in general business. The second named association, known as the A. A. A., or "the three As", is a purely business organization, bent upon forcing advertising mediums to prove their claims for patronage, in the way of circulation, etc. The last named, known as the A. N. A. M., works in a field including efficiency as applied to the work of its members and a vigorous and comprehensive campaign for the general improvement of advertising conditions, chiefly with reference to eliminating objectionable advertising from periodicals and inducing advertisers to adopt more truthful and efficient methods.

It is the Associated Advertising Clubs of America, known as the A. A. C. of A., that is doing the most consequential as well as the most noticeable work. This is owing to its scope and organization, and to the fact that it has become the voice of a great movement in business looking toward fairer conditions. It is organized for general work, and its membership includes all classes of business men, the only general limitation being some interest in advertising. The other national associations have very specific and definitely limited purposes. This great popular association is able to respond to any demand that is made with sufficient emphasis and definiteness, which also may be connected with the activities of the advertising profession in some well recognized manner.

These three organizations, together with the specialized or localized work of many individual clubs, divisional organizations, independent associations of a relatively small number of clubs, and the extremely efficient work of some of the great advertising agencies and individual advertisers, have effected a revolution in the business of promoting the sale of goods which is as significant as it is generally unknown. The investigator has only to search the pages of the big advertising mediums for a period covering the past five years to become convinced that there has come about a very great and most significant change in the general character of advertising. One familiar with advertising as it was finds that a great class of deceptive advertising has been driven out of respectable mediums of all kinds.

I wish I had space to go into detail on this point, and also to describe with much more particularity the work of these three organizations, which are now doing far and away more for the general uplift of business than any other class of organizations. But as a page is only a page, it is not possible. I shall be glad, however, to assist any reader who wishes further to investigate the wonderful phenomenon of advertising playing the part of the greatest purifying influence in business, and for the very evident selfish motive of increasing trade through advertising.

In the Realm of Insurance

By W. E. Underwood

On this occasion, instead of selecting two or three subjects related to insurance on which to build as many brief discourses, we propose to discuss in plain, matter-of-fact fashion a few of the many inquiries which of late have been received by this department from readers. At irregular intervals in the future, if this departure from the beaten track shall seem to be a success, the experiment will be repeated.

The questions which come to us represent real human needs. All are requests for guidance. Some are seeking a knowledge of the character as well as the solvency of insurers; some want advice on how best to minimize past mistakes; others desire explanations respecting the comparative differences between several plans of insurance; and there are those who, contemplating an increase in the amount of insurance they are carrying, lay before us the various propositions received from agents and ask our aid in making the proper selection.

Some of these letters reflect the awful devastation wrought by the assessment associations of twenty and twenty-five years ago, for they come from men who have become uninsurable through age and physical infirmities, but who are making heroic sacrifices to pay the crushing premiums actually required to keep their policies alive. Most of the promoters of those assessment organizations are either dead or out of the insurance business; the majority of them were rankly ignorant of the science of life insurance, and it is to be feared that too many of them were conscienceless. But not all of them are dead, nor are they all retired from the insurance business. Some of them have grown venerable, comparatively wealthy; they have abandoned assessmentism, espoused the cause of the legal reserve system which they formerly maligned and denounced, and are regarded, by those unacquainted with their careers, as among the original real things in life insurance.

Several weeks ago we had something to say on the subject of rebating, and referred to the difficulties which were encountered by companies and State officials in their efforts to abolish the practice. We are in receipt of a suggestion from Mr. Guy Haythorn, of Wichita, Kan. He says:

"How would this do as a remedy? Let all the first class old line companies, before receiving or allowing an application for a policy, require the agent and the insured to jointly or separately make an affidavit (which must be properly acknowledged) that there has been no agreement, express or implied, between them that any amount of money, or any valuable thing, should be paid back as a rebate, either directly or indirectly, or by any third person or persons; and, furthermore, let each solemnly bind himself not to pay on the one hand, or to accept, on the other hand, a rebate, either directly or indirectly, at any future time."

Our correspondent explains that he has had no experience as an insurance solicitor and frankly admits that the proposed remedy may be impracticable. We have some misgivings as to its efficacy, based on the belief that State cannot make such a requirement of a citizen in connection with the purchase or sale of any lawful commodity. Again, if it can be enforced, it would hold only the honest among solicitors and insurants, and the dishonest would successfully evade it.

A gentleman in Franklin, O., whose identity it is not necessary to disclose, explains that, for ten or twelve years past, he has carried a certain amount of insurance in one of the leading companies, using the annual dividends in part payment of the premiums, and that now he is in a position to increase the amount and leave the dividends to accumulate. He has about concluded that he should have the contracts paid up by the time he is sixty. He continues:

"Now I have thought to take another $—— of insurance. I have been considering another policy with the ———, or one with the ———. I am at a loss to know which is better for me. I would want this policy to become a paid-up policy, I think, and would probably want one or other of them to be paid as an endowment. . . . Now, for my purposes, which is the better, an Ordinary Life policy with the ————, leaving my dividends with the company to mature the policy, or a similar policy with the ———, allowing the policy to mature under their ——— plan?"

The intimate details contained in this communication are omitted here, and our reply has been forwarded by mail.

From Webb City, Mo., we have received the following request, signed by Mr. Richard Jenkins:

"I am a regular reader of THE INDEPENDENT and am greatly interested in your articles on insurance. At your convenience will

you kindly publish an article exp'aining the reserve feature of life insurance? How amount is fixed? What does 3 per cent., 3½ per cent. and 4 per cent. basis really mean? Why does a 3½ or 4 per cent. policy carry a less loan or cash value—which is the reserve—than a 3 per cent. policy? What relation has the American Table of Mortality to the percentage basis a company is on?

"An insurance agent explained this to me, but I don't catch it. Perhaps these questions are so simple that they would not deserve space in your articles; if so, please refer me to where detailed information could be found. The agent referred to seemed to think it such a simple matter that I feel I am exceedingly dull not to grasp it."

There is just a little less information extant among policyholders and agents on the subject proposed by our correspondent than on any other connected with life insurance. To reverse the order of the questions: the American Table of Mortality (the one in general use in the United States) assumes that, of a given number of insured persons of a given age holding Ordinary Life policies, the last one will die in his ninety-sixth year. When that man dies, the reserve to the credit of his policy will exactly equal its face. With the interest which was earned, he has, in his premiums, paid it into the company himself. His annual level premium contained what we may call three elements: a certain sum, determined by the Mortality Table, to be used in paying death claims; a second sum, safely large enough, to meet the expense incident to carrying on the business; and a third sum to be retained and invested at an assumed interest rate, known as the reserve. The death claims of those whose deaths preceded that of the last man were paid for out of the current mortality contributions, plus the reserves to the credit of their policies; and in each case these two elements exactly equaled the amount of the claims. Therefore, the reserve is that sum, contributed yearly, and improved at the rate of interest assumed, which will, under the conditions of the Mortality Table, equal the death claim.

A "3 per cent., 3½ per cent. or 4 per cent. basis" means that the rate of interest assumed for investing the reserve is 3 per cent., 3½ per cent. or 4 per cent.

A 3½ per cent. or 4 per cent. reserve is smaller in amount than a 3 per cent. reserve because more money is required to invest at 3 per cent. to secure a given result in a specified period of time than is required if the interest rate is higher. Loan and cash surrender values are based on reserve values. The lower the rate of interest assumed, the higher the reserve investment must be, and vice versa.

The present tendency is toward the 3 per cent. reserve as the safest assumption, and it will not be many years before all the insurance outstanding will be carried on that basis. That the assumed rate will ever fall below that figure in this country is quite improbable. To conclude, we will repeat what is generally known: that dividends, so called, consist of the savings made on the assumed expenses, savings made on the assumed mortality, and excess interest earned on reserves.

Notes

Testifying before the House Committee on the District of Columbia at Washington one day last week, Mr. A. M. Best, an insurance expert, stated that soon after the San Francisco fire Mr. J. P. Morgan tried to organize a fire insurance trust with a capital of $50,000,000. Mr. Morgan knows about as much on the subject of trusts, their nature and power, as any man alive and certainly knows that a monopoly in that branch of trade is impossible. He may have thought of organizing a huge corporation to do a fire insurance business, but evidently regarded it, after investigation, as too uncertain as a maker of profit.

The Nassau Fire Insurance Company of Brooklyn and the Dutchess Fire Insurance Company of Poughkeepsie have been merged into one corporation under the name The Nassau and Dutchess Fire Insurance Company. The financial condition of the combination, as certified by the examiners of the New York Insurance Department, as of date June 30, 1912, was as follows: Total admitted assets, $1,495,976; total liabilities, except capital, $771,760; capital stock, $400,000; surplus, $324,216; surplus to policyholders, $724,216.

Mr. William B. Ellison, of New York City, a lawyer who has some fire insurance practice, has received an appointment from Governor Sulzer as a special commissioner to investigate the fire insurance laws, with a view to making recommendations in connection with the standard form of policy.

The announcement is made that a syndicate representing the Fidelity & Deposit Company of Baltimore has acquired a controlling interest in the capital stock of the American Bonding Company of Baltimore, and that the business of the latter will be taken over by the former.

Financial

The Output of Gold

The world's output of gold in 1912, according to the estimate of the Director of the Mint, was about $465,000,000, which exceeds that of 1911 by $5,500,000 and makes a new high record. The growth of the output is shown below:

1890....	$118,848,000	1902....	$296,737,000
1891....	130,650,000	1903....	327,702,000
1892....	146,297,000	1904....	347,377,000
1893....	157,494,000	1905....	380,288,000
1894....	181,175,000	1906....	402,503,000
1895....	199,304,000	1907....	412,966,000
1896....	202,251,000	1908....	442,476,000
1897....	236,073,000	1909....	454,145,000
1898....	286,879,000	1910....	454,704,000
1899....	306,724,000	1911....	459,500,000
1900....	254,576,000	1912....	465,000,000
1901....	260,992,000		

Africa leads in production, its output in 1911 having been about $192,000,000; second place is held by the United States, with a little less than $100,000,000; and Australasia, whose output has been declining, is third, with about $60,000,000. H. D. McCaskey, in the Geological Survey's report on mineral resources, expresses the opinion that the rate of annual increase will decline, and that the demand for the metal in the arts and industries, and for the basis of national currencies, will grow faster than the supply. The Rand's output, in his judgment, will probably continue to increase for a few years, and for many years will be very large, but the rate of increase in Africa will decline. The output of the United States, according to him, has probably reached its highest point.

Prices After Dissolution

Since dissolution of the Standard Oil combination was ordered by the court, the prices of petroleum products have sharply advanced, as well as the quoted prices of the stock of the former subsidiaries of the parent corporation or Trust in the share market. The wholesale price of gasoline has risen from 9 cents a gallon, at the beginning of 1912, to 17 cents at the present time, one cent having been added last week. Kerosene's wholesale price has been increased in a year from 6 to 9 cents. In London, the strike of the taxicab drivers is due to a large increase of the price they are required by the cab owners to pay for gasoline. Mayor Fitzgerald of Boston, declaring that the exaction of the new prices is robbery, proposes that the city shall sell to owners of automobiles at the wholesale rate.

In the share market, the prices of Standard Oil stocks have moved upward rapidly. The parent company's shares were quoted last week at $1186, altho the highest price before dissolution was less than $900, and the price at the time of dissolution was about $675. The shares of several of the disintegrated subsidiaries show great increases. A firm that makes a specialty of transactions in oil shares says that in 1912 the holders of the old stock and of pro rata portions of the subsidiaries' stock received in dividends the equivalent of $60½ a share, which considerably exceeds the dividends paid before dissolution. In addition, several of the companies have distributed very large accumulated surpluses.

With the share prices steadily rising, the dividends enlarged, and the prices of products greatly increased, it is not surprising that some consumers are unable to see how the public has gained anything by what is called the dissolution of the combination.

Notes

Among the exports from this country in 1912 were 11,000 miles of motion picture films, $30,000,000 worth of automobiles, $1,000,000 worth of telephones, and aeroplanes valued at about $125,000. Automobile exports have grown from $15,000,000 in 1910 to $22,000,000 in 1911. The average export price of the machines has been declining. It is now a little less than $1000.

The Long Island Loan and Trust Company, of Brooklyn, is to be merged with the Brooklyn Trust Company, which will be the largest institution of its kind in the borough, as it will have a capital of $1,500,000, a surplus of about $3,900,000, and resources exceeding $30,000,000. It is understood that Theodore F. Miller, now at the head of the Brooklyn Trust Company, will retain the office of President. This company is affiliated to some extent with the controlling interests in the First National Bank, of New York, and prominent officers of the Long Island company have been associated with Rockefeller interests and those of the National City Bank.

Mr. Baker's Testimony

There was a popular demand in 1908 and 1909 for a downward revision of the tariff. The strength of this demand was not correctly measured by those who desired that the existing tariff duties should be retained. In Congress and elsewhere the manufacturers who enjoyed excessive protection opposed such reductions, as a vast majority of the people believed that justice required. They were successful. A political revolt followed, and now there is at hand a downward revision, to be made by those who oppose the doctrine of protection. If they had permitted a just reduction in 1909, and assisted in making it, the new duties then enacted probably would have remained in force for several years. They failed to appreciate the tendency and force of public sentiment.

There should be in this a lesson for Mr. George F. Baker and other prominent financiers of New York, for the New York Stock Exchange, and for the great banks of this city. Those who have been intimately associated with Mr. Baker, and many others directly interested in the transactions for which Mr. Baker and his associates are responsible, should carefully consider the testimony given by him before the Pujo committee, and should ask themselves whether they ought not to assist that committee and Congress in shaping and completing legislation affecting concentration of banking capital and credit. It is not a distinctly competent committee, and its attitude toward financial interests and the money center of the New World has been hostile, but the representatives of those interests should assist it and thus strive to procure fair legislation. Mr. Baker said to the committee that he thought the concentration of the control of credit had "gone about far enough." How is further concentration to be prevented? Mr. Baker himself, and those associated with him, should strive to answer this question for the committee. We quote from the record of the proceedings:

Q. You think it would be dangerous to go farther?

A. It might not be dangerous, but still it has gone about far enough. In good hands I do not see that it would do any harm. If it got into bad hands it would be very bad.

Q. If it got into bad hands it would wreck the country?

A. Yes; but I do not believe it could get into bad hands.

Q. You admit that if this concentration, to the point to which it has gone, were by any action to get into bad hands, it would wreck the country?

A. I cannot imagine such a condition. I said I thought it would be bad, but I do not think it would wreck the country. I do not

think bad hands could manage it. They could not retain the deposits nor the securities.

Q. We are speaking of this concentration which has come about and the power that it brings with it getting into the hands of very ambitious men, perhaps not overscrupulous. You see a peril in that do you not?

A. Yes.

Q. So that the safety, if you think there is safety in the situation, really lies in the personnel of the men?

A. Very much.

Q. Do you think that is a comfortable situation for a great country to be in?

A. Not entirely.

The people' by means of their legislators, should take measures to protect themselves and the country, and to prevent great injustice and wrong, if the power should fall into bad hands. It may be recalled that Mr. Baker expressed a favorable opinion of the late Jay Gould. He was saying to the committee that he saw no impropriety in being a director of each of two competing railroads:

"Jay Gould used to say, and he told me once, that the greatest success he had was in being on two boards where he could adjust differences that might have caused a great deal of disturbance. I consider him a good authority. That is what he stated was his success, and I beı eved him."

But the people of the United States would not care to see the great power, as to which Mr. Baker had testified, in the hands of men like the late Mr. Gould.

So far as we can estimate the present condition of public opinion, it may be described as follows: There is a widespread conviction that the public has been and is unjustly taxed, or robbed, by means of legislation and by institutions and systems supported by legislation. The enormous private fortunes of these days are regarded as, in most cases, the fruit of such conditions. The people think they have been forced to contribute to these fortunes through the agencies of manufacturing combinations, excessive tariff duties, and banking alliances. Many have come to regard the New York Stock Exchange with hostility, because they believe it to be the instrument with which the collection of a large part of the private taxes is accomplished. When they read such testimony as Mr. Baker's, about the enormous profits of his national bank ($86,000,000 in fifty years, upon an original capital of $500,000), about the interlocking directorates, the highly profitable underwritings, etc., they are confirmed in their belief that there is great need of reform. Their representatives in Congress and in Legislatures are inclined to propose changes which will involve severe Federal or State regulation. Mr. Sulzer, the new Governor of New York, is about to ask for legislation, it is understood, requiring the incorporation and official supervision of the New York Stock Exchange. Federal regulation of the same Exchange will probably be proposed at Washington. It would be politic for the officers and members of the Exchange to begin the work of regulation and reform. There are evils which could be removed by their own action. We do not hear that they are attempting in this way to forestall the work of Congress or the State Legislature. It may be that both at Washington and at Albany the measures proposed will be in part harmful rather than beneficial. The arguments of the Exchange should be fully presented in both places, and the Exchange should show a willingness to promote such changes as the public interest requires.

This also should be the attitude of Mr. Baker and other financiers of his rank. It is known, we think, in Washington that public opinion will approve legislation of much severity affecting the financial system and transactions and institutions to which Mr. Baker's testimony related. A part of this legislation may be uncalled for and even harmful. As we have said, those who would be primarily and directly affected by it should strive, in coöperation with the committee, to shape it in a beneficial way. There is no room for doubt as to the attitude of the public. Neither the

leading financiers of New York nor the Stock Exchange should blunder now as the Republican protectionists did in 1909, when the tariff was taken up for revision.

Deliberate Militarism

And now we are to have an Army League! The announcement of the new organization, sponsored by a list of notable gentlemen, has just been given out at Washington.

Tho it is claimed in its initial manifesto that the object of the League is not "to create a large standing army or to preach militarism in the United States," it is significantly added "preparedness is the best insurance against war." It can fairly be assumed, we think, that the primary purpose of the League will be to saddle upon the nation a great and ever greater army. Unless it is totally different from the other Army and Navy Leagues in existence, that is precisely what it is created for and will try to do.

There is every political, economic and moral reason for not increasing the size of our army. In the first place, we have not an enemy on the face of the earth, nor are we likely to have one if we mind our own business and live up to our treaty obligations. But even granting the possibility of war with a first-class power —second-class powers can manifestly be left out of consideration—our geographical position and the temper of our hundred-million population make us absolutely safe from invasion. It is disheartening to see this military madness sedulously being cultivated in free America, especially when fostered by otherwise good and patriotic citizens. Our peace organizations should keep a watchful eye on this new Army League, as well as on the older Navy League. Let them heed not the counsels of those Elder Statesmen, who, like ex-President Eliot, would have them follow rather than lead public opinion on the armament question.

The Price of Books

The saffron-backed French book which bears the price, "Three francs fifty centimes," stamped on its back. and costs the New Yorker seventy-five cents at Brentano's, sells in Paris for three francs—or about fifty-eight cents. This is what the Frenchman pays for most of his fiction, verse, drama, politics, popular science—the chief exceptions being works freely illustrated, memoirs of a sort strictly limited in appeal and works of scholarship that run to more than, say, 350 pages. These cost the Parisian four francs or five—rarely more, except in the case of editions of luxury, while there are many desirable reprints available at five, ten, twelve and twenty cents. The American in France revels in the opportunity to read and to possess books for himself at prices he can afford. That is why he is perturbed at the threat of the French publishers that they may raise their prices by almost ten cents. As for the frugal Gaul, the prospect throws him into a state of uncontrolled excitement. In a newspaper we read—but let us translate:

> It is not for bibliophiles that volumes of the current type are destined. The bibliophile does not read his books; he prides himself on showing them to his friends and gazing at their backs, magnificently bound and well ranged on the shelves of his bookcase. The yellow volume at three francs, on the other hand, has no *raison d'être* save that of being read. The purchaser of these modest paper-bound books without outside finery is a man who reads. Enjoyment of the works of the spirit almost always goes with a mediocre bank account, for it is not a lucrative taste and it prevents one from giving himself up to more fruitful enterprises. Far from being willing or able to pay higher prices for its books, the reading public manifestly demands more moderate prices than those ruling to-day. Three francs already frighten it a little; three-fifty will infallibly send it out on strike.

These observations apply also to the American book public, that even now pays far more than "three-fifty" for its books. There are many books which would attain large enough sales actually to increase the publishers' profits were they issued at a

smaller margin of profit. There are other works, especially books of travel and various kinds of translations, which publishers pay out unreasonably with punky paper and oceans of margin and inordinately large type: all that they may make an excessive price seem reasonable. A great opportunity offers itself today to the well-established publisher who will cut loose from some of the traditions of his trade and issue new books for the people at prices that the people can afford to pay—as has been done so far only in the case of certain notable series of "classics." Even these are sold at a great advance over the English prices—partly because of the higher cost of production here and the protective tariff. The higher type of newspaper and the best of the magazines are the real literary bargains of the age, and have circulation and influence.

For Church Reunion

The Episcopal Commission for a World Conference on Faith and Order has sent out, from its chairman, Dr. Manning, of Trinity Church, New York, and Mr. Robert H. Gardiner, secretary, Gardiner, Me., a circular letter addressed to those interested in its plan for the reunion of Christendom. Among such THE INDEPENDENT is to be counted.

We regret that the signers anticipate that years will pass before the conference can be held; so much will have to be done in the way of preparation. The first question, they say, is "whether we Christians really desire reunion." Of that we have no doubt, so far as Protestantism is concerned, for nearly the whole of American Protestantism, and equally of British Protestantism, is already in federated union, and separate denominations are successively consolidating. But perhaps federation does not meet the point which the Commission has in view. Other questions which they raise as preliminary are serious, and we hope will not wreck the project:

> Have we that deep and definite faith in the one Lord which must fill us with the desire to unite in His one Body? What are faith and membership in Christ? Is the relation of the Christian to Christ merely individual, or does it constitute membership in a body? Is that body merely a human organization, self-originating, or is it the living, continuous Body of the one Lord? What is the Church? Has it any authority, and, if any, what? What is the basis of its claims?

We had supposed these were the questions that were to be discussed in the World's Conference. If they must be settled first, there may be indefinite delay. And yet in the proposed conference they could never be settled except by allowing liberty to differ. We like the proposal of the Commission that in smaller or larger groups men meet together to discover how far they are prepared for further reunion, and we suggest that those interested write to the secretary, when they will be put on the mailing-list and will receive whatever documents are issued.

Forbidding to Marry

The only ex-president of the United States earnestly denounced the evasion of the duties of paternity as an act of treason to the country, but during his administration a midshipman was dismissed from the navy for the crime of marrying and has not yet succeeded in getting reinstated into the service. If his intention had been less honorable the naval authorities would not have regarded his offense so serious.

The only ex-president of Harvard has eloquently argued for early marriages, but Harvard, alone among the secular universities of the United States, maintains the old monastic rule that a fellowship is forfeited if the incumbent marries. Minor love affairs, not having as their object matrimony, are not inquired into by the university.

Of what avail are these good counsels if the following of them is forbidden? Why should the influence of the army and the navy and the uni-

versity be exerted against a normal and proper manner of life? The graduates from our military and naval academies are picked young men, selected for physical and mental excellence from every State in the union and rigidly sifted by a course designed especially to eliminate the unfit. The Harvard fellows have proved their intellectual superiority by a long series of competitive examinations. Yet these men, because of their exceptional qualifications, are compelled to remain celibate until late in life while the stupid, the lazy and the unambitious are free to transmit their characteristics to the next generation. Darwinism as a theory has long been taught in our colleges. The moral lesson of Darwinism they have yet to learn. And to the authority of Darwin we can add that of Milton:

> Our Maker bids increase; who bids abstain
> But our destroyer, foe to God and Man.

The Idaho Contempt Case

It is a very unfortunate act of the Supreme Court of Idaho that it should have put two editors of an Idaho journal in prison for reprinting a vigorous utterance by Mr. Roosevelt. The Idaho Supreme Court had excluded the Roosevelt electors from the official ballot, just as the California Supreme Court had excluded the Taft electors. Mr. Roosevelt was very indignant and exprest himself very vigorously, as is his custom. What he wrote the editors reprinted, and now they have to go to prison for it. It was contempt of the court.

Such action will hurt the court more than it will protect it. Just such an act aids the movement to reduce the power of courts to protect themselves in contempt cases. To criticize a court's action ought not to be forbidden. A court at times deserves criticism, and its action is criticized by a higher court. Even the decisions of a supreme court may be wrong and unjust, as a multitude of people believed and fully said in the case of the Dold Scott decision. Certainly the addresses of a candidate for the Presidency ought to be privileged if anything is, and newspapers ought not to be forbidden to copy them. We do not pretend to say whether the decisions of the Idaho and California supreme courts were correct or not—the presumption is that they were correct—but the people have the right to think them wrong and to say so strongly. We do not wonder that Mr. Roosevelt is very angry that two men should be imprisoned for repeating his words.

Another Sort of King George

With the New Year we may properly congratulate the Mother Country that she has a king of whom she does not need to be ashamed, even tho he bears the name of George. The world praised God when the other line of Georges ended, but only words of praise are given to him who stands fair, with his honored queen, to rehabilitate the name. What was thought of the last George may be seen from the editorial on his death by the London *Times*. It said:

> The truth is that there never was an individual less regretted by his fellow creatures than this deceased king. What eye has wept for him? What heart has heaved one throb of unmercenary sorrow? Was there at any time a gorgeous pageant on the stage more completely forgotten than he has been, even from the day on which the heralds proclaimed his successor? . . .
>
> If George IV ever had a friend—a devoted friend—in any rank of life, we protest that the name of him or her has not yet reached us. An inveterate voluptuary, especially if he be an artificial person, is of all known beings the most selfish. Selfishness is the true repellent of human sympathy. Selfishness feels no attachment, and invites none; it is the charnel-house of the affections. Nothing more remains to be said or done about George IV but to pay—as we must—for his profusion, and to turn his bad example to some account by tying up the hands of those who come after him in what concerns the public money.

That was written only eighty years ago.

The Canal Treaty

Prof. George G. Wilson of Harvard University, lecturing on the Panama Canal at the University of Paris says:

> The Hay-Pauncefote treaty may not meet present conditions, as it was drafted when the canal zone was foreign territory, whereas it is now the property of the United States.

It looks rather as tho the professor had never read the Hay-Pauncefote treaty, for that document makes express provision for the change in ownership of the Canal Zone, which was even then anticipated, in the following language:

> IV. It is agreed that no change of territorial sovereignty or of international relations of the country or countries traversed by the before mentioned canal shall affect the general principle of neutralization or the obligations of the high contracting parties under the present treaty.

The Power of the General Will

Do reckless and ruthless men ever picture to themselves the power of the General Will?

Do they ever find time to read the story of the reckless and ruthless men of other days? Do they ever think why it is that greed and egoism of the monstrous sort leave no enduring achievements?

Alexander and Caesar, the Italian despots, and Philip of Spain, the Stuart kings and the Bourbon monarch, who declared he was the State, Robespierre and Napoleon, were not smaller men than Tweed and Murphy, than Aldrich and Mellen, than Ettor and Haywood. Yet the reckless and ruthless men of to-day go about their ambitious undertakings with the world-old self-confidence that has led the fatuous of all generations to disaster.

The general will is like the giant forces of nature. It is diffused and intangible, elusive and hidden. It lets men play with it, and seemingly defy it; but when they have defied too far, it kills like the lightning and wrecks like the tempest.

The men who built up the slave power in America thought that they were safe. The men who have been building up the capitalistc power have believed that they were safe. Perhaps some of them still think that they are safe. The men who are devising a power of violence and destruction in the hope of overturning organized society and devastating civilization, will cherish for a time the delusion that they are safe. They have learned nothing from the past; they have no power to analyze the present. They will move straight on to their destiny.

And so will the general will. In its own time and in its own way the general will will crush them. Thru ages of slow progress the general will has created social order. It will maintain civilization; it will broaden opportunity; it will establish justice. Not many men will understand it, but every man will heed it. Every man will learn to work with it and thru it for the achievement of general human ends, or he will be broken and thrown to the scrap heap by it.

Complacent Ignorance

Many things would go better than they do in the United States if our elaborate machinery of education worked more effectively than it does to dispel ignorance. Its principal business just now seems to be to convert ignorance of the plain or elemental kind into the complacent variety.

As populations go the American population is not illiterate. Nearly everybody can read the baseball bulletins and the bargain day ads. Much too small a proportion of the children enrolled in the primary schools goes on to high school study, but the number could be increased if it were as well worth while to increase it as it is, for instance, in Germany. A relatively large proportion of the American youth of both sexes goes to college. As long as the net result of American college education is what it is at present, there is

no very good reason, that we can think of, why the proportion should be larger.

A child, a youth or a man is ignorant in the elemental way when he doesn't know how to read or write, and when his mind has no content of those facts and ideas which make up the sum of human knowledge. The child or the youth or the man is ignorant in the complacent way when he thinks that he can read and write, tho in fact he cannot, and when he supposes (quite honestly perhaps) that his head is stored with information when in fact it is not.

Now if any cheerful optimist among our professional or amateur "educators" sincerely believes that our schools and colleges are educating American children and youth in the sense that they are dispelling ignorance instead of teaching it the manners and the consciousness of complacency, he should try a few simple experiments.

Let him take at random from the highest grades in American primary schools a thousand children and discover how many of them can with any sense or understanding read a page of a simply told story, or a plainly worded paragraph from a municipal ordinance, or a card of shop instructions issued to the employees of a mill; and how many of them can write a neat, legible hand.

Let him choose in like manner a thousand High School boys and girls and discover how many of them can do any one of the four following things quickly and accurately: (1) perform the arithmetical operations that arise in every-day business accounts and in simple mensuration; (2) correct a carelessly written composition or a galley of printer's proof; (3) read at sight a newspaper in any one foreign language; (4) weigh or measure solids and liquids as accurately as a pharmacist's clerk is obliged to weigh them.

Finally, let him choose college graduates at random and discover how many per thousand can do any one of the following things: (1) talk easily, felicitously and accurately, when unexpectedly called on, upon some one phase of English literature, upon some one chapter of American or English history; (2) in an emergency help an engineering acquaintance make calculations involving no mathematics beyond elementary algebra and trigonometry; (3) explain in a simple way but accurately to a group of settlement workers the biological basis of the germ theory of diseases like tuberculosis and typhoid, or explain to a famers' institute the Mendelian basis of selective breeding; (4) write a decently exprest letter to a foreign correspondent in French, or Spanish, or German, or Latin.

For our part we should like to know how many American school principals and superintendents, college and university presidents and "educators" not otherwise classified, would like to see their theories, facts and practical performances subjected to these simple tests.

We predict that if the tests were made in good faith our educational "plant" would be subjected to a radical overhauling.

Every human being must live and die ignorant of many things. The educated man or woman is one whose ignorance has been dispelled, not glossed over, in respect of some things. The educational institutions of each grade should train a majority of their students to do some one thing well; to know at least one thing accurately.

The primary schools should see to it that a majority of their pupils can read and write well. The secondary schools should see to it that a majority of their pupils can express themselves in their own language simply and accurately, and know accurately and use readily either another language or the elements of at least one science. The college should see to it that a majority of its students can express themselves in speech and writing not only accurately, but also felicitously, and know enough of some one branch of litera-

ture, history or physical science to make worthy use of it for themselves and their fellowmen.

At the present time our educational institutions are not doing their job.

The Jewel Consistency

A correspondent who is indignant at our condemnation of the McNamaras and the Syndicalists for resorting to violence in behalf of labor challenges us to republish the editorials of THE INDEPENDENT at the time of the John Brown raid, hoping thereby to convict us of insincerity in our present condemnation of violence. THE INDEPENDENT makes no profession of absolute immutability and consistency and no one of the present corps of editors was on the paper in 1859. But we are willing to accept the challenge and we print below the essential paragraphs of the two most important editorial utterances of that period, the first published in the issue of October 20, 1859, at the time when the news of the raid was first received, and the second published December 8, 1859, when John Brown was executed:

In another column will be found full particulars of the late exciting affair in Virginia. It seems to resolve itself into an infatuated scheme of a few men to abet the escape of slaves by a violent outbreak producing public confusion and alarm. The instigator was a somewhat famous man, familiarly known in Kansas broils as "Old Brown," or "Ossawatamie Brown." Exasperated by the outrages of the Propagandists of Slavery in Kansas; having seen four of his sons butchered by the Missouri ruffians; his own life having been threatened, and hunted for a reward, the old man was transformed from an honest, sturdy farmer, into a lawless brigand, and having vowed vengeance upon the authors of confusion in Kansas, he had chosen to imitate their murderous forays, by carrying the war into the heart of a slave State. As Brown was accustomed in Kansas to get up fighting expeditions on his own account, and not as the representative of any party in the territory, so he has gone into this fearful venture of death, solely on his own responsibility. Unless his movement was part of a widespread scheme of insurrection, now frustrated by a premature outbreak, it was in every point of view the height of madness; and even if it stood related to such a scheme, it would seem to have been both foolish and criminal.

John Brown failed in his scheme of a general slave stampede (he never planned an insurrection or a revolution) because in the very nature of the case this was impracticable. The slaves were not prepared for it, nor was there any feasible mode of accomplishing it. Such a movement, always doubtful and hazardous when the slaves themselves are enlisted in it, must, of course, be futile when they are not ripe for it; and to put in jeopardy the safety and the lives of a whole community in an unsolicited and necessarily hopeless attempt to benefit any portion of it, is a measure that cannot be justified by any code of ethics, natural or Christian. The motive of the actors may be good, their character unselfish and sincere, their object may be just and righteous, and under favoring circumstances, even the *means* employed might be justifiable;—but the sheer impossibility of doing the thing proposed makes such an attempt unwarrantable. Success even in a good cause does not always justify the means by which it is achieved; but the impossibility of success may well discredit means which are always doubtful in their own nature, and can be justified only by circumstances.

There is no limit to which one may not go in protesting morally, by word and example, against a wicked law. If that law seizes upon him thus protesting, and makes him its victim, he dies a martyr for the right. But it is quite another thing to take up arms and assail the law by violence, and challenge its penalty as a combatant. It is one thing to oppose a wrong by argument, and to testify against it even unto death, and quite another thing to put in jeopardy *all* the interests of society in the forlorn hope of rectifying *one* by physical force.

It will be seen from the above extracts that then as now THE INDEPENDENT stood for the righting of wrongs by argument and the ballot and condemned the use of violence on the ground of both morality and expediency. Just as in the old days we alienated some of our friends because we could not approve of John Brown's raid so within the last few weeks we have lost subscribers because we have denounced the use of violence by the militant suffragettes

in England and by the militant industrialists in America. Nevertheless we shall use our utmost efforts to remedy in a peaceable way the many injustices under which the laboring classes and the women are suffering.

Father Lagrange

The late condemnation of the writings of Father Lagrange, editor of the *Revue Biblique*, for heresy, forbidding his writings to be read by students for the priesthood, has attracted the attention of scholars over the world, as he was known thru the *Revue* and as the head of the Dominican Biblical Institute of Jerusalem. In response to requests made to the Sacred Congregation which condemned him it has specified at some length his errors, which we give briefly. His articles in the *Revue Biblique* excessively abound, it is said, in eulogies of rationalistic writers, praising their erudition, and speak with irony of Catholic writers whose views are not "liberal." The contributors of the *Revue* do the same, and among them are some apostates, and others justly suspected for their liberal views.

Father Lagrange has disparaged inspiration, admitting historical inaccuracies in the sacred text. He says that, with the exception of the sin of our first parents, all the rest of the history down to the time of Abraham is an "immense void." In his books he speaks disrespectfully of the right of the Church to control the teaching of exegetes. He utters serious errors as to the origin and truth of the four Gospels. He says that Mark and the Logia were the chief sources of Matthew and Luke. In his commentary on Judges he has so treated of its sources as to throw discredit on its historical reliability. He has also ignored the exegesis of the Fathers, as well as of Catholic scholars, to give preference to heterodox writers. It appears that Father Lagrange's "errors" are those that are prevalent among Protestant scholars; and the Biblical Commission has decided every question in the most conservative manner.

It will be remembered that Father Lagrange as a loyal child of the Church has bowed respectfully to the condemnation of his writings, but does not say that he changes his views. It remains to be seen whether he will do any more writing.

Haywood Rejected by Socialists

The Socialist party has evidently tired of the antics of Wiliam D. Haywood. A referendum for his recall as a member of the National Executive Committee, proposed by the State organizations of New York and New Jersey, has been submitted to the membership and is now being voted on. There is little doubt that it will be carried by a large majority.

Haywood was elected to the National Executive Committee a year ago, receiving the third highest vote among the candidates. His success at the time was attributed to the lack of information on the part of a considerable section of the membership regarding his views on principle and tactics. Since then he has gradually thrown off his disguises and has taken a position somewhat similar to that of the Anarchists. In particular he has violated the clause in the party constitution, prohibiting the advocacy of sabotage of violence. This clause was adopted at the Indianapolis convention last May by a two-thirds vote against the strenuous protests of the Haywood element, and was afterward confirmed by a three-fourths vote of the party membership. Haywood's attitude on this question has since then aroused bitter protests from the party in various sections of the country. The culmination of the antagonism came when, a couple of months ago, in a public speech in New York City, he openly counseled sabotage as well as abstention from political action. The formal demand for his recall was made immediately afterward. Other proceedings have also been taken against him, demanding his expulsion from the party.

In Brief

We have the following from Mr. André Tridon:

"Allow me to take exception to one sentence contained in your editorial upon the subject of direct action. It reads:

"'Mr. Tridon tells us how to do it. Coal can be set on fire in the pockets, explosives, etc.'

This is not my statement, but a quotation from Pouget's speech; for personally I disapprove of destructive sabotage. Other considerations left aside, that form of direct action is illogical; of what use would the shops be to the workers on the 'Red Dawn' if by that time all the machinery had been sabotaged into scrap iron? Sabotage of the kind which is beneficial to the consumer and passive resistance are the only direct action weapons I approve of in case of strike. When the hotel workers asked me the other day to give them a definition of sabotage according to the leaders of the General Confederation of Labor, I took special care to caution them against following the example of some Washington chefs, who had mixed caustic potash with the food, thereby injuring perfectly innocent parties."

Mr. Tridon's article, publisht in the same issue with an editorial, seemed to indicate approval.

The Crawford-Sulzer bill, embodying the suggestions of President Taft concerning an international conference to consider the high cost of living and the causes of the increase in recent years, is still pending in the House. It has been passed in the Senate. We do not understand that it is opposed in the House by either the majority or the minority. Final action should not be delayed. Unofficial assurances that invitations to take part in the proposed conference will be accepted have been received from several European countries. The work for which provision is made in the pending bill should have been undertaken some time ago. There is need both here and abroad of an authoritative report as to the causes of the increase of the cost of living.

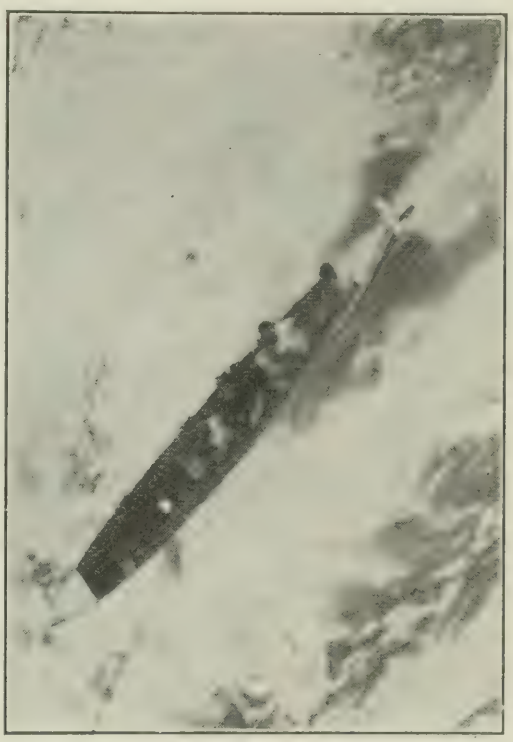
It is shown by complete returns that the popular vote at the election in November last was about 15,033,000, or larger by 145,000 than that of 1908. When allowance is made, however, for the women added in two States, and for the admission of two territories, there is really a loss of more than 300,000. The Prohibition vote was less by 47,000 than that of four years ago. The Socialist vote rose from 420,000 to 900,000, and nearly half of the gain is found in the States of California, Washington, Illinois, Ohio and Pennsylvania. Mr. Wilson's vote was less than Mr. Bryan's 1908 vote by 105,000, and the combined Taft and Roosevelt vote exceeded it by 1,311,000.

While we were not satisfied with the composition or the Industrial Commission nominated by President Taft, we regret that, with other nominations, it is likely to be held up by the Senate and to fail. We have received more than one letter from men whose judgment are much respected particularly commending the choice of Senator Sutherland as a man who has devoted more study than any other member of either House of Congress to labor questions and industrial legislation, and who has earnestly labored for the appointment of the commission. As chairman the value of the commission's work would depend largely on his devotion to it.

The occasion for the granting by the Catholic University at Washington of a special honor to J. Pierpont Morgan as Patron of Arts and Letters, is his putting in the hands of Professor Hyvernat for publication the wonderful collection of Coptic manuscripts which he acquired at a very high cost. Prof. Hyvernat is our most distinguished scholar of the Coptic language, and edits the Coptic literature for the great series of Oriental Christian Fathers being issued by Catholic scholars of Europe. Of all men Mr. Morgan most deserves that honor.

A number of ecclesiastical journals are finding fault because Cathedral fraternal societies, such as the Knights of Columbus, take in members who are not practical Catholics, that is, do not go to confession and to mass once a year; and they are asking to "fine-comb our fraternals." If excommunicated there why not excommunicate them also from the church? Are they not counted and credited to the Church, millions of them? Have they not been made trustees of Cathedrals? Must the Knights of Columbus be stricter than the Church?

We have been concerned somewhat lest the Democratic Congress should pass the bill to drop the Philippines. We observe that the Washington *Post*, which has a way of anticipating the policy of the party, has come out in favor of retaining control of the Islands.



Russia warns foreign airmen that they must not cross her frontier or they will be in danger of being shot. As many airmen as choose are welcome to fly all over the United States.

A Christmas in Panama

By James A. B. Scherer, Ph.D., LL.D.

[President Scherer of the Throop Polytechnic Institute, Pasadena, spent the recent holidays in Panama, and gives us this glowing account of the trip.—EDITOR.]

Canal or no canal, a trip to Panama is the ideal journey for Christmas. We steamed out of the cold fogs of New York harbor, thru a "confused sea" that upset some of the stoutest passengers into the tranquility of Southern waters and the balmy warmth of tropical sunshine, to find Kingston a delight and Panama City itself a revelation of romantic old-world entrancement. Why need one travel to Europe when he has only to take the next Pullman for Mexico in order to "feel the soft tread of history under his feet" and catch the enthralling aroma of a vanished civilization? From Columbus to Bryce, we Americans have depended on other folk to discover our environment to us! Now that the fame of the new poet, John Masefield, has been sealed by the Royal Society, it is to be hoped that we will begin to turn the leaves of his forgotten prose work, *On the Spanish Main*, published in 1906. The spicy breezes of the Caribbean Sea are redolent with the memories of the three Columbuses, de Leon and de Soto, Velasquez and Balboa, to say nothing of bold buccaneers such as Morgan. Dreamy as these romantic waters are, one could easily imagine some stately galleon looming against a cloud in the distance, full-rigged and billowing, with Captain Hook, his snickersnee in hand, standing boldly, arms folded, on the poop,

THE GREYHOUND CAYUKA

The Black Steersman cutting capers with his tethered canoe—just before the accident.

Approaching Kingston, we ourselves first shipwrecked and then rescued a boat's crew. The dusky Jamaican pilot having clambered aloft over the side of our steamer, his cayuka, manned by four sturdy negroes, grappled to us with a rope tether, and swished swiftly along thru the water as only a razor-back cayuka can. The steersman, however, had evidently spent his Sunday "in his cups," and these had been rather too full; for, in spite of repeated warnings from the stroke-oar, who served as anchor-post for the tether, he cut capers with this greyhound canoe, swerving her now out from the ship at sharp angles, and then testing how sharply he could drive her in toward us without plunging smash against the keel—an ivory grin slashing his countenance, while all our passengers crowded over the rail forming the "gallery" for whom he so proudly performed. But, alack! our merry steersman at length shot towards us too sharply and could not recover his rudder. In a trice an overturned cayuka bobbed among the waves a mile behind us, surrounded by four black bobbing heads. Our great ship swept in a slow majestic circle backward thru the turquoise sea, a lifeboat was rapidly lowered, and presently four soaked oarsmen were snoring peacefully on one of the hatches, while their hoisted cayuka—dug bodily from a gigantic cottonwood,

and named the "Watina"—snoozed lazily across our bows, like a rescued papoose, submitting tamely to the impudent camera.

No "mild-eyed Caribs" welcomed us to Jamaica's fragrant shores, but there was greeting enough, for all that. Kingston keeps perpetual holiday, but at Christmas time its bounty fairly overflows, so that the rawest stranger yields speedily to the seductive hospitality of these dusky lotus-eaters in the land of the "always afternoon." The most voluptuous dreams of the tropics are here quite amply fulfilled. At the Myrtle Bank hotel—what name could be more beautiful or more appropriate?—ocean breezes make music among the palm branches, and the sea sleeps under one's elbow, while delicious rare fishes are served on silver trays, and one rich luscious fruit after another tempts the eye and the palate

THE CLAMOROUS CONFUSION OF THE KINGSTON MARKET PLACE

ROCK BOTTOM
The sign on this behemoth reads: "This Shovel on Canal Bottom."

conjointly. What a riot of color and sound there is in the marketplace! No Oriental bazaar can surpass it in musky splendor or clamorous confusion or dirt. Gay multitudinous streamers of fluttering ribbons, coiled ropes of mellow Jamaican tobacco, stacked in rows like headless casks, immense and innumerable trays of ogling fly-blown fishes, pyramids of pineapples and mountains of mangoes, cords of real yams, benches loaded with filigree gewgaws, swinging, screeching parrots and pert monkeys, jostling good-natured elbows, balancing huge loads of merchandise on unbending black heads, and a clamor of human tongues that could surely outbabble Babel—such is the kaleidoscopic marketplace at Kingston. Outside the city, thru avenues of the Royal Poinciana, one reaches the lovely Hope Gardens, as beautiful with tropical verdure and foliage and flower as the imagination of Balzac himself could conceive of. Here, in this perfect Arcadia, we appropriately left the bridal couple whose friends had showered the decks with rice in cold New York, congratulating them on their good judgment in staging their honeymoon.

The best thing to do on reaching Colon is to take the next train for Panama. The contrast between these two places is startlingly sharp and definite, seeing they are so close together, only a little more than two hours apart by the railroad. Colon is a vulgar border town, consisting of several miles of parallel streets packed with tame flat houses, all of a sordid sameness, whose inhabitants loaf and chatter in the steaming hot sunshine with "Manana" as their everlasting shibboleth. Panama is a glorious city of old, builded with castles from Spain.

It is a good railroad by which one plunges into the wilderness; our first experiment in government ownership is a pleasing success. The new line, entirely on the east bank of the Canal, has been just completed, at a cost of $200,000 a mile. However, this new line is now used for only a part of the journey, our train crossing to the west bank at Gorgona, and getting over on the east side

CROSSING THE PEDRO MIGUEL LOCKS

again at Corozal. From Colon one jumps sheer into the jungle. Altho the rainy season was but a fortnight gone, so that the vegetation had barely had a chance to rest from growing and begin blooming, it had made brave use of the respite. Most noticeable were the gorgeous blossoms of the *lignum vitae,* purple and yellow in splendor. So plentiful is this wonderful iron wood in the jungle that the French actually used it for cross-ties, boring holes for the spikes, which would have bent and broken if driven. Our government, however, has imported softer wood for this purpose, as there was no time for hole-boring when long sections of track had to be lifted bodily and relocated almost on a moment's notice, as the exigencies of engineering might require. Orchids, in the most opulent variety, feed on the trees that crowd and struggle for fuller life in the dank swamps, fighting their way to the sunshine. The railway is just a tunnel thru the jungle, a wonderful achievement in itself. It is flatly incredible that Balboa transported, with the aid of thousands of Indians, the material for a fleet across this barrier of slushy tangle and forest-crowned mountains and wild rivers between the two oceans; only, the fact is, he did. The smallest honor we can give this magnificent man is to send the first vessel thru the Canal on the 25th of next September, his anniversary, as is now proposed. Of course our thoughts were full of him all the time we were on the Isthmus, and we thought of him in those most fitting words of Keats—

> When with eagle eyes
> He stared at the Pacific—and all his men
> Look'd at each other with a wild surmise—
> Silent upon a peak in Darien.

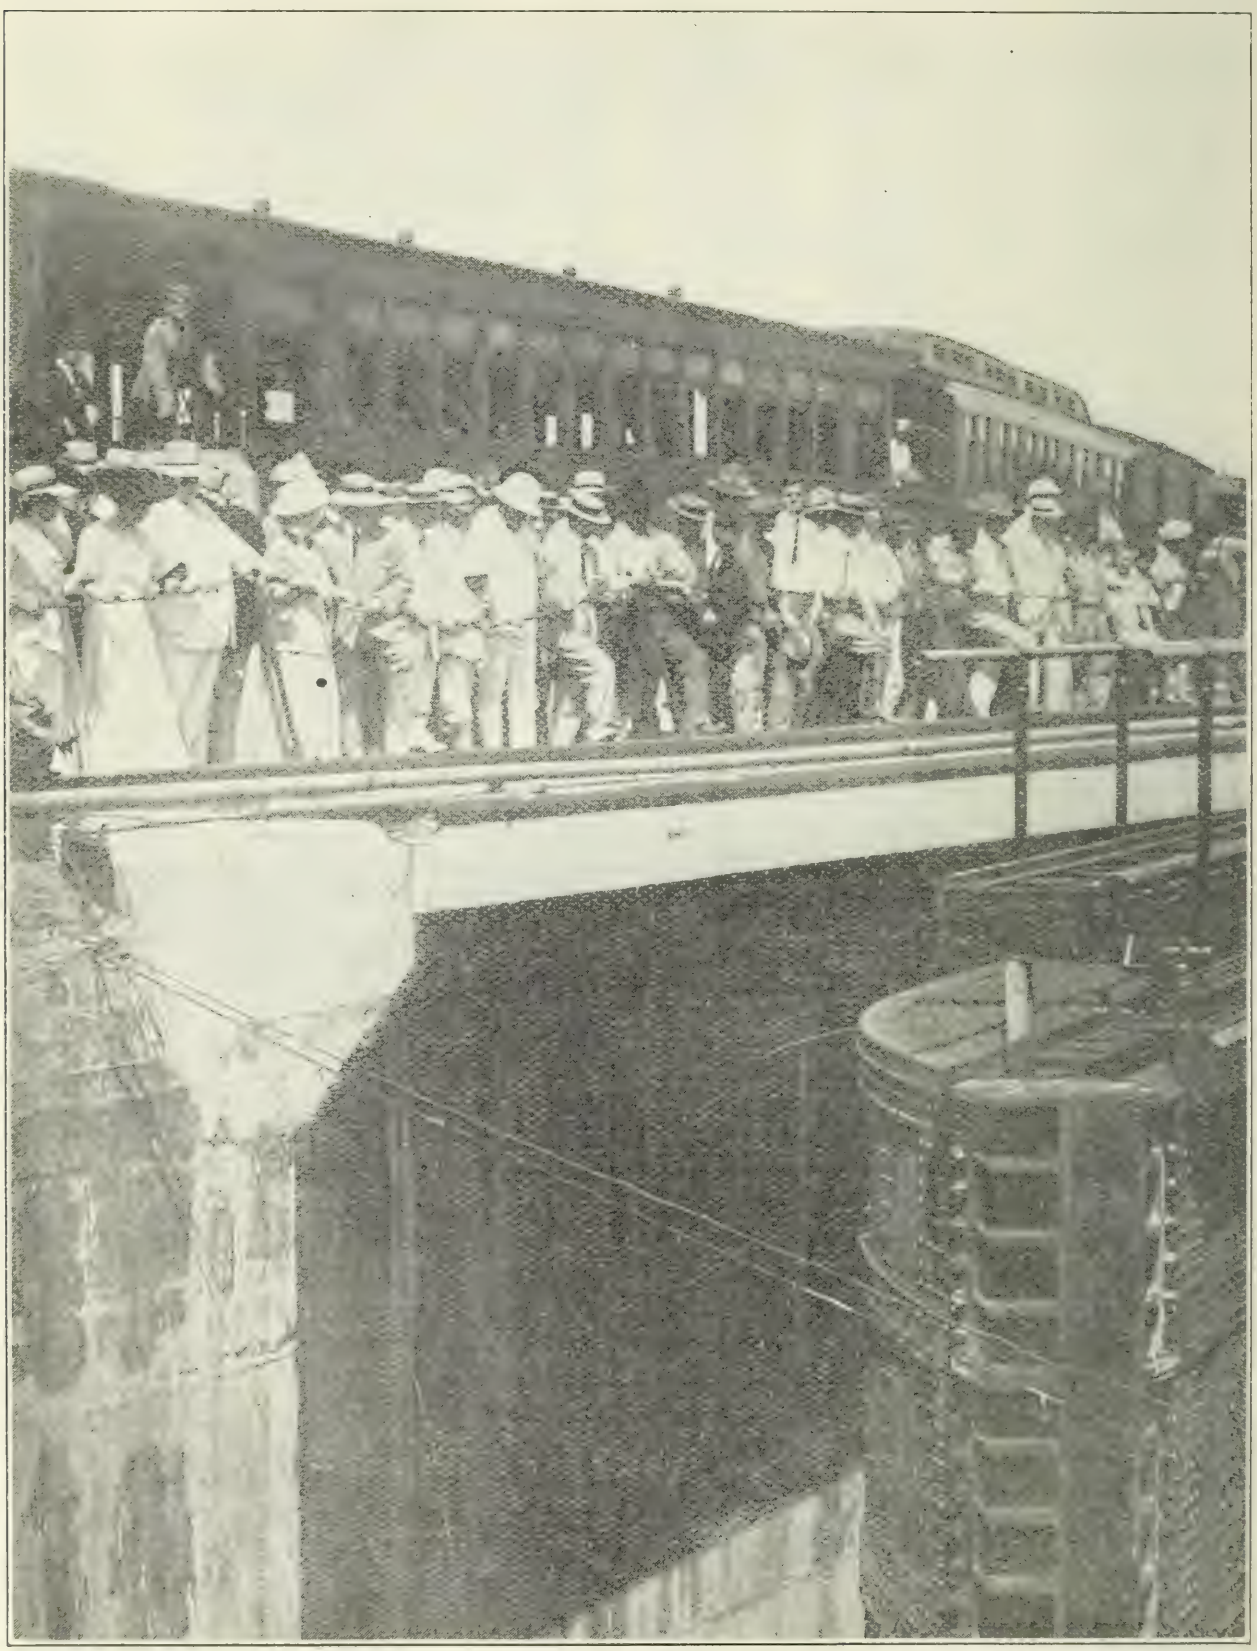
And it was two new "planets" that "swam into our ken" when first the great full moon, and then the royal sun, arose and looked on us at Panama from out of the Pacific Ocean, instead of sinking to sleep in it, as well-behaved suns and moons do in California. To Californians, too, who are used to a four-day trip across the continent, it was a marvelous thing to cross from ocean to ocean in two hours and a quarter to the minute.

But what shall I say of Panama on the full-orbed evening of Christmas? Venetian palaces seemed to crown the hills and crowd the narrow echoing streets; every window twinkling with an extra holiday light, for it is not only the night of the sacred festival, but the President of the great Republic of the North has come to town, and there will shortly be a grand ball to welcome him, at which the President of Panama himself will be present, together with four ex-presidents of this infant Republic, whereas the old United States can boast only its redoubtable One! Tinkling mandolins and twanging guitars make the aromatic charm of the moonlight on the flowers and royal palms to become sensible, as it were, to the hearing. Panaman beauties, crowned with wonderful flowering head-pieces but bare as to their tawny feet patter and chatter on the pavement of the latticed courts, or

from myriad overswung balconies. And the sea wall! The Spanish King whose coffers built it remarked that it ought to be visible even from Spain, it cost so much; and here it is today, a lasting monument to Spanish munificence, rising precipitous far above the splashing tides, facing the blue ocean fearlessly, flanking this ancient city of hills, dungeons beneath it, a silent sentry pacing its moonlit ramparts—the veriest bit of visualized romance that human eyes may behold: The most precious benefit of travel is by way of memory. Always hereafter hung between two etchings in the gallery of remembered delights —the Japanese Inland Sea in cherry time, and a Venetian lagoon bathed in impossible Turner light-of-gold—I shall carry this picture of Panama from its old sea wall on the full-moon Christmas night of 1912.

But it is time to switch off sentiment, return to Tivoli and go to bed, for to-morrow we are to join the President's train and see the big business of the Canal.

An elevated lake across the Isthmus, confined by gates of steel at either end—such is the Panama Canal. The head of this lake, on the north, is held back aloft from the Atlantic by a huge dam, equipped with a set of hydraulic elevators, or locks, in which ships will ride up and down. The lake is to be shaped, roughly, like a "stingaree," or sting ray, floating eighty-five feet above sea level, with an area of 164 square miles. Its broad head or body is twenty-three miles in length; its tail, nine miles long, cuts a narrow slash thru the continental divide, straight for the Pacific, near whose doors two other sets of elevators do their work without aid from a dam. Lake Gatun is fed by a copious unfailing river, whose surplus waters are let out into the Atlantic thru a spillway in the big dam. There is plentiful power to keep the hydraulic elevators running full time, and that is why we have a lock canal. It is far easier, by the use of this free supply of fresh water, to lift ships over the mountains than it would be to lower the mountains and the bed of the charges down to the sea level.



TAFT BOULDER

A steam shovel lifting a mass of rock weighing between nine and ten tons—as seen from the President's train.

It is a most stupendous achievement, just as it stands to-day. One must go there if he would clearly comprehend it. Photographs are lamely inadequate; they want the proper perspective, and are unimpressive. Mr. Pennell's drawings are far better. The reality is like the forges of Vulcan, the gorges of Cyclops, the furrows that Thor might have dug in Valhalla. In a few months the water will be wholly on, and the splendor of herculean labors covered forever; to-day, and to-day only, the Canal is the wonderful sight of the world, a grand canyon hollowed out by man to harness Neptune.

On the day after Christmas I saw it from the President's train. Contrary to common belief, a larger force of hands is at work than at any time since labor began; the population of the Zone being now about 40,000, one-eighth white. All departments of this vast labor army are in full action, working twelve hours a

day—from the heavy artillery of the steam shovels, whose smoke clouds the valley, and the resounding battering rams within the gigantic steel chambers, to the needle-guns of the air-drills, and the random picket with his oil-gun, shooting mosquitoes. Ceaselessly and endless roll the transportation trains, half of them conveying the vanquished forces of earth to a grave in the Atlantic, the other half headed for

Copyright, International News Service.

THE TAFT PARTY AT THE GATUN LOCKS

the Pacific. Everywhere in the Zone there is thrift; even this dirt is not wasted. Two breakwaters are being built out of it and the boulders, one to protect the Bay of Limon from Atlantic "northers," the other to defend Pacific ships from a belligerent current that cuts in at right angles to the Canal's southern mouth.

The steam shovels, which might well be nicknamed "teddies" if only they wore glasses, challenged the rapt attention of the President, with their gleaming rows of steel teeth and their strenuous capacity for business. One of them, to the sound of Presidential applause, picked up a regular Taft boulder of some nine or ten tons, reserved for his special amusement, and deposited it on a waiting flat-car with the precision of a golfer teeing his ball. Each behemoth was neatly labeled for Presidential inspection, showing its relation to the ultimate base. Some bore signs like the one in my picture: "This Shovel on Canal Bottom"; while others ranged all the way up to "Thirty-three Feet Above Canal Bottom." There were long piles of incessant drills, suggesting great grasshoppers, perched on the sides of Culebra cut, and sometimes high on the hills, chattering petulantly while kicking gimlet holes into the rocky soil so that blasts of dynamite could ease the way for the shovels.

I have likened the shape of the Canal to a "stingaree." As with that ugly little sea devil, its sting is in its tail—Culebra, or Snake, Cut. Here befall nearly all the troubles that are turning the Colonel's hair a whiter gray. Especially slides. There was a huge one at Christmas, as tho for the President's delectation. Just a mass of avalanched mountain dumped into the ditch, to keep the steam shovelers busy on redoubled duty. These slides will doubtless continue, even after the Canal is completed; but huge suction dredges will suck the bottom clear "in less than no time."

The Canal gives an emphatic impression of rapidly nearing completion. Culebra Cut is in line with the schedule for next September, while of the three sets of locks Miraflores is 94 per cent and Pedro Miguel (or "Peter Magill," as we call him) 99 per cent finished. The chief forces of mechanical construction are engaged with the giant locks at Gatun, three in number, with their enormous emergency dams, but this work also is highly advanced (being 93 per cent completed), and will be finished long before the Cut is scooped clean. On the whole, it is an efficiency record for every American to be proud of; for, while the amount of excavation has proved to be 90 per cent more than the original estimate, the calculated time for the removal of material has been reduced 30 per cent.

It is hard to accord too much praise to "the Kitchener of the Canal"—Colonel Goethals (pronounced Go'-thalls). His hold on the admiration of the Zone people is unmodified. They like him because he is "so just and so modest," as they phrase it, working by methods "peculiarly his own." One important phase of this method is a wise and beneficent despotism. The men like to tell you how he has, more than once, overridden the entire Commission, as in the case of a certain tug captain; and how "the Colonel is most generally right." This was the answer I got, for example, concerning his plan for the depopulation of the Zone. As I discerned it, there are two chief grounds on which he may base this opinion; one military, the other sanitary. The defense of a large body of civilians so far from home would be enormously difficult in case of war, the jungle affording unbounded opportunities for ambuscade and guerrilla warfare; while sanitary problems are indefinitely multiplied by colonization, the yellow fever mosquito breeding only around human habitations, and being difficult to control in proportion to the increase of settlement.

Colonel Gorgas rivals his chief in

the admiration and affection of the "natives," as our American residents have begun to call themselves. They have a Society of the Chagres down there, to which anyone is eligible who has remained for six years, the button being a black disk surrounded by a gold circle and bearing six bars. I talked long with an Ohioan who seems to know the Zone from rim to rim. He remembers the pestilential days, before Gorgas, when rats and cats, dogs and horses, were living sores; and points now to a bill of health that shames New York. Engineer Wallace, according to him, was driven away by dread of disease, "and small blame to him." It was Colonel Gorgas who made the building of the Canal possible thru making the Isthmus habitable by people from the temperate zone. The headstones of countless dead Frenchmen dot many a hillside; but every American seems to be a living monument to Colonel Gorgas, whom my Chagres friend proudly pronounced not only a prime health officer, but also his "ideal of a perfect gentleman." Every creature on the Isthmus, in fact, sings the praises of this modest Georgia doctor, except the mosquito, who, they tell us, is ashamed to sing, and to bite—"he is afraid of Colonel Gorgas." I saw in the cars of the Panama Railway what I have never seen in "the States": a little ingenious trap-box near the tank of cold, filtered water, with the generous legend, "Sanitary Cup — Pull One." There they are for the pulling; while we have only got so far, here at home, as to deprive the traveling public of any cup whatsoever unless they chance to have one about them. Six years ago Mr. Taft accorded great praise to Colonel Gorgas for his work in checking yellow fever, but added: "It does seem an almost impossible, a hopeless task, to prevent the spread of malaria." The little surgeon, however, has cut down the grass, and dispersed or discouraged the anopheles.

President Taft has never done anything better than his effort to sanction and advance the benevolent despotism that rules and should rule the Canal Zone. If a foolish Senate endeavors to balk him and to hinder the progress of this splendid American achievement, in order to play peanut politics, there should be instant and stinging rebuke. Further, the iniquity of a subterfuge subsidy must be removed, under the pretext of free tolls to coastwise ships, and good faith demonstrated toward England. Congress should be forced to keep step with the honesty and efficiency of such leaders as Goethals and Gorgas.

Pasadena, Cal.

Song of the Wind

By Thomas E. Burke

Like an unfettered flame I swept the vale,
  Kissing a tear drop from a rosebud's cheek,
And as I sped full fast upon the gale
  "Come back, my love," I heard her soft voice speak.

Today with songs of a remembered bliss
  I come in hope to touch her garment's hem,
O love in ashes, kindled from a kiss,
  The withered petals, and the broken stem.

Notre Dame, Ind.

All-Year Schools

By John Cotton Dana

LIBRARIAN OF NEWARK FREE PUBLIC LIBRARY

Newark, N. J., has made the first thoro test of the all-the-year public school method.

The test was most successful and demonstrated, as far as such a test can, that cities can adopt the all-year plan and thereby hasten the progress of children in their studies, improve rather than injure their health, increase the income of teachers without overworking them, increase by nearly 30 per cent. the use made of public school buildings and apparatus, thus promoting efficiency without increasing the tax rate, and make it possible for children to cover in the six years from six to twelve the course of study and the training and discipline now taking the eight years from six to fourteen.

THE INDEPENDENT should chronicle the success of this experiment, first, because it is undoubtedly the beginning of one of the most important changes in public school work made in a generation; and, next, because THE INDEPENDENT published in its issue for Sept. 26, 1907, an article on "Vacations and Holidays in Schools" in which for the first time in many years, either in an educational or a general periodical, the all-year school system was frankly advocated.

Dr. A. B. Poland, Newark's Superintendent of public schools, has been for several years studying the subject of all-year schools. He came to the conclusion, in 1910, that a careful test should be made of the new method. He had noted the great success of local summer schools which Newark was the first city in the United States to adopt. Newark has to-day a larger summer school attendance than any other city save New York. He observed that they had steadily grown in importance, in the number of pupils they enrolled, in persistence in attendance, in the money spent upon them, and in the care and thought devoted to them by the management.

As the article above mentioned in THE INDEPENDENT pointed out, it is obviously an economic waste for a city which maintains summer schools to close the whole regular system and dismiss all pupils and teachers in June and then establish an entirely new system for a short six weeks' term of the summer.

Superintendent Poland felt that even in the rather trying summer climate of Newark most children were better off during the mid-day hours of school in well-ventilated school rooms than on the streets. He had noted, of course, the great loss of time in the school year due to examinations and other functions in June incidental to the closing sessions before a ten or twelve weeks' vacation.

These and like considerations, most of which were touched on in THE INDEPENDENT'S article in 1907, induced him to make to his board of education in 1911 the recommendations which were carried out in 1912 as follows:

Belmont avenue and Seventh avenue schools were selected for the experiment for these reasons:

(1.) Each is located in a thickly congested district, where social and economic conditions are favorable.

(2.) A large percentage of the children are in the habit of attending the six weeks' summer half-day summer school in July and August.

(3.) Most of the pupils are children of foreign parents, Jewish and Italian, who wish to have them progress as fast as possible.

(4.) They enroll about 2,000 pupils each and hence furnish a sufficient number of pupils for an economical as well as a fair trial of the plan.

(5.) Preliminary inquiries showed that

not less than 70 per cent. would attend the all-year sessions.

(6.) The principals are good organizers and well equipped for the work.

Failure under these favorable conditions would not be laid to bad management, but to defects in the plan.

The preliminary steps toward organizing these schools under the all-year plan were taken during the latter part of May. On the first day of June the plan was put into operation.

The all-year schools have each year four twelve-week terms, the regular schools two twenty-week terms.

The great success of the Newark experiment has led the superintendent to recommend that it be continued in two schools next year, and that if still successful it be gradually extended. This means that it will be given a very thoro trial before it is applied to the entire school system. Objections and criticisms will be carefully considered and modifications made to meet difficulties which may arise, all as wise school practice dictates.

Here are the facts as to enrollment, attendance, etc., in the two schools. They tell the story better than it could be told in pages of explanation:

Statistics of All-Year Schools, of Newark, N. J., June 1 to August 23, 1912.

Total enrollment 2849
(This is about 70% of the total enrollment of the regular schools in the same buildings.)

Average enrollment 2614
Average attendance 2397
No. who left during the term..... 282
Of the average enrollment the average attendance was..... 91.7%
(This is slightly higher than the same figure for the regular schools.)
No. of pupils promoted.....1962
(This means that 1962 children are three months nearer the end of their elementary education than they would have been had they spent July and August on the city streets.)
Per cent. of pupils promoted..... 90.2%
(This is higher than the per cent. of promoted pupils in the regular schools.)

No. of cases of tardiness..... 545
" " " " truancy 3
" " " " illness of pupils attributable to school..... 1
No. of days illness of the 69 teachers 13½

The superintendent, the principals, the medical inspector, the teachers and visitors, including several educational and administrative experts, all unite in saying that the health of the children who attended the all-year sessions "did not suffer in the least." This was in spite of the fact that they were without vacation from early in March to the end of July.

The habits of cleanliness taught in winter were not lost during a long vacation, as is often the case, and the children came to school in clean and neat condition. The teachers reported that they felt less exhausted at the end of August than they usually do at the end of June; partly, no doubt, because of the absence of pressure of examinations and preparation for long vacations. Moreover, the more ambitious and industrious and consequently the more orderly pupils were the ones who elected the all-year course. They naturally made the work of the teachers easier than do the winter classes.

Attendance was purely voluntary. Even after a pupil had chosen the all-year course, he was not compelled to continue it. The high per cent. of attendance meant keen interest in education on the part of parents and pupils.

Work went on well even on the hottest days. Windows were open, fresh air was abundant; the close and stuffy atmosphere of winter was never present.

The superintendent, principals, teachers, medical inspectors, visitors, experts, newspaper men, all tried to discover in the pupils some indications of resentment or bad feeling over being kept in school during summer; but without the slighest success. The school rooms all gave the impres-

sion of cheerfulness, good-will and even enjoyment of the tasks in hand. The pupils were there at the request of their parents in most cases, of course; but the older ones seemed without exception to realize that they were making progress in education, that the school room had some attractions not offered by hot city streets, and that five hours for five days each week were not too many from a day of 24 hours to give to school work, even in summer.

If the two schools in which the all-year plan was tried had had larger playgrounds they would probably have had an even larger summer attendance. Well equipped park and public school playgrounds near by were attractions with which all-year sessions had to compete.

Thus far no serious objections to this innovation have been discovered. It shortens the elementary course by two years. If applied to the high school it will shorten the total course of 12 years by three years. It promotes good habits, of industry, cleanliness and civility; it gives better hygienic conditions; it does away with the burden of long vacations and particularly of the injurious pressure which precedes each long vacation and the trying readjustment which follows it; it adds nearly 25 per cent. to the use made of the city's school plant; it increases the teacher's gross annual income and, while it lengthens her task, it lightens its nervous strain.

American public schools are not the failures that much recent criticisms of them would indicate; but they can be made better than they are; and the adoption of the all-year plan seems to be one of the most obvious ways to increase efficiency.

Newark, N. J.

Renewing Old Acquaintances

By Edwin E. Slosson

To be in a foreign city for the first time, to watch a stream of strangers and all of a sudden to catch a glimpse of an old, old friend, that is the sensation I experienced on opening a new book* with a shiny Christmas cover and hitting upon these verses:

By the hoof of the wild goat up tossed
From the cliff where she lay in the sun
Fell the stone
To the tarn where the daylight is lost;
So she fell from the light of the sun,
And alone.

Now the fall was ordained from the first,
With the goat and the cliff and the tarn,
But the stone
Knows only her life as accursed,
As she sinks in the depths of the tarn,
And alone.

Oh, Thou who hast builded the world,
Oh, Thou who hast lighted the sun!
Oh, Thou who hast darkened the tarn!
Judge Thou
The sin of the stone that was hurled
By the goat from the light of the sun,
As she sinks in the mire of the tarn,
Even now, even now, even now!

**Songs From Books.* By Rudyard Kipling. New York: Doubleday, Page & Co., $1.40.

Go to, Messrs. Doubleday, Page & Co. I care naught for your copyright. I know these lines by heart—or at least I did in the long gone days when I learned poetry by heart. Anyway I copy from my original clipping, a relic of the good old times before the copyright law was passed and we Americans levied tribute upon all nations. I dig it out of its dusty envelope in my scrap-book, a corner torn off from a newspaper as one nowadays tears off the fateful triangle that involves one in paying a dollar a month for the next ten years for a History of the World or Complete Works of Balzac. The scrap is but slightly yellowed and still tough; not so yellow and rotten as some newspapers are now at very birth. Judging from the type and adherent news it dates from 1890 and was clipt from the *Kansas City Star*, then about rising on the horizon to the east.

The scrap is rather worn, doubtless from over-long carrying in the

pocket to read to anybody I could corner for the purpose, mostly the boys of the Excelsior Club who were the most addicted to verse of the students of Kansas University: some of them have never broken off the habit. I remember that we discussed hotly—we discussed all things hotly—the question of who "Rudyard Kipling" was, for obviously the name was a "pseudo-plume"; nobody could be born and christened so.

To double our perplexity the poem was accredited to "The Unpublished Papers of McIntosh Jellaludin." Anyhow we hoped that as literary executor of the deceased Mr. Jellaludin, Mr. Kipling would hurry up and publish the rest of his remains, The Book wrapped in a petticoat and stuck into the hole in the wall.

Also we wanted the rest of that fascinating fragment which most misappropriately introduced an hilarious tale of bureaucracy entitled "Pig":

Go, stalk the red deer o'er the heather
Ride, follow the fox if you can!
But, for pleasure and profit together,
Allow me the hunting of man—
The chase of the Human, the search for the Soul
To its ruin—the hunting of man.

This desire is apparently destined never to be satisfied, for in this new volume of collected verse the unfinished window of Aladdin's tower unfinished still remains.

In the case of another of the verses introducing the "Plain Tales" we were more lucky in following the float to the lead. That was "The City of Dreadful Night," which we in our ignorance ascribed to Kipling himself, but later discovered to our delight that there was a whole volume of this glorious gloom by one Thomson.

Some of these early poems have had a curious history. "The Voortrekker," lost for long, was found again in the heart of a friend. It belongs to our West, tho it bears a Boer name as does also "The Explorer," tho the scene of that is Australia. The real spirit of expansion, the impetus of the pioneer, which has conquered continents, old and new, has rarely been better exprest than in these lines:

THE VOORTREKKER

The gull shall whistle in his wake, the blind wave break in fire.
He shall fulfil God's utmost will, unknowing his desire.
And he shall see old planets change and alien stars arise,
And give the gale his seaworn sail in shadow of new skies,
Strong lust of gear shall drive him forth and hunger arm his hand,
To win his food from the desert rude, his pittance from the sand.
His neighbors' smoke shall vex his eyes, their voices break his rest.
He shall go forth till south is north sullen and dispossessed.
He shall desire loneliness and his desire shall bring,
Hard on his heels, a thousand wheels, a People and a King.
He shall come back on his own track, and by his scarce-cooled camp
There shall he meet the roaring street, the derrick and the stamp:
There he shall blaze a nation's ways with hatchet and with brand,
Till on his last-won wilderness an Empire's out-posts stand.

Another maverick here rounded up and branded with the owner's name is a peace poem; quite a different sort from the blood-lusty spirit of his early tales and later histories:

All the world over, nursing their scars,
Sit the old fighting-men broke in the wars—
Sit the old-fighting men, surly and grim,
Mocking the lilt of the conquerors' hymn.

Dust of the battle o'erwhelmed them and hid
Fame never found them for aught that they did.
Wounded and spent to the lazar they drew,
Lining the road where the Legions roll thru.

Sons of the Laurel who press to your meed,
(Worthy God's pity most—ye who succeed!)
Ere you go triumphing, crowned, to the stars,
Pity poor fighting men, broke in the wars!

Some of the newer poems in the volume are of interest; for example, "If," with the shortest title and the longest sentence of any verse, even breaking the record of "Satan ex-

alted sat" which the prize pupil used to diagram artistically on the blackboard for the teacher's institute. Another recent acquaintance but already a favorite of mine is the "Song to Mithras." If this in any degree represents the spirit of Mithraism it is no wonder that it was a close rival of Christianity for many centuries. But I will not speak of what I may not quote. It would in any case be inappropriate to discuss these later poems here, for they are really by a different tho not another writer. They were not written by the Kipling I knew in the nineties. The higher critic of the future will by internal evidence ascribe them to "the Deutero Kipling" or K_2 if not to some twentieth century redactor who had assumed his name but not his style.

New York City.

Acquiring the Social Point of View

By an Individualist

The world changes so rapidly these days that even I, who am considerably on the right side of forty, can heave a sigh and remark that things are not as they were in *my* youth. For instance, I remember that it was once accounted a distinguished thing to be an individualist. One could decline to go on a committee to raise money for a new hospital, or to take a hand in prison reform or in improvement of the poor-laws, without a twinge of that thing that we now call the "social conscience." For the individualist was the fashion. His well-known habits of reading, reflection, introspection, his liking for quiet places, his friendship with Ibsen, Nietzsche, and Emerson were understood and appreciated. Before the unquestioned rights of these tastes the bustling world that sat on committees retired respectfully.

But the twentieth century has changed all this. To-day, when I settle myself to studious meditation or golden dream, a rough breeze from outside is sure to disturb the spick and span order of my interests. My nice little theories blow about like worthless bits of paper. I grow ill at ease, often unhappy, and Ibsen, Nietzsche, and Emerson cannot, with combined effort, lift me from my megrims. For I have grown to realize that I am out of date. I am still an individualist, while the rest of the world has moved on and arrived at the social point of view.

My friends, the Howlands, certainly have. By a dozen signs I feel the presence of an enlightened social consciousness in their small apartment. It shows in the easy irregularity of their meals, in the continual ringing of their telephone and door bells, in the alert, interested cheerfulness of their faces. A fastidious individualist would find that apartment a disturbing background for revery and self-communion. The family upstairs suggest perpetual motion, a train rattles by every minute or two on the tracks half a block away, the opened closet door bangs against the bed. There is no special place for the books; they are forced to beg quarters in the hall, in a corner of the dining-room, on top of the sideboard, on every window-sill. The typewriter has a corner to itself in the kitchen.

But the Howlands are indifferent to these inconveniences. To them the apartment is only a place where they eat, sleep, keep a few necessary articles, and have a great many queer people in to dinner. To regard the routine of eating and sleeping as important, to devote to it much time or ceremony, is to them unspeakably bourgeois. Every morning Mrs. Howland, with the aid of a dish rack, an oiled dust cloth, and a small vacuum cleaner, speedily reduces the place to a condition of unemotional neatness. Then she devotes herself to study of the mind and activities of her three-year-old daughter, who is being

brought up according to the ideas of Montessori. Anyone who has looked into the matter knows what this means. You can't say to such a child: "Hush; don't bother me with any more questions. Go off and play, or I'll shut you up in the closet." Mr. Howland, for his part, finishes at his office his daily column of editorial matter, rushes it thru the composing room, rolls down the top of his desk, puts the green felt over the typewriter, and disappears. Where does he go? I'm sure I can't say. It may be one of a dozen places. Perhaps he goes over to the City Club to devise methods of suppressing vice; or to deliver a lecture at the School of Civics and Philanthropy; or to speak on Equal Suffrage at the Woman's Club; or to confer with a committee for the Advancement of Colored People; or to instruct a class of Lithuanian girls at Hull House; or to talk on Socialism in Milwaukee. He is a versatile needle in the social haystack.

The range of interests possessed by the Howlands is very wide. There are two things, however, that they view with decided disapproval. One of them is Post-Impressionism. Fastened to the wall of their living-room by means of a sharp, rebuking pin, is a copy of one of the pictures from this "School of the Future." It presents a leaning house, a crooked fence, a flock of malformed sheep, two or three attenuated human figures, and a stringy railway train. These various objects, drawn by a bold but naïve hand, are jammed together without regard for perspective. The picture presents, I am told, the artist's objective statement of his subjective experiences on a train. The picture has a strange attraction for me. Anatole France sighed for the power to see the world thru the eye of a fly, to comprehend it with the rude brain of an ourang-outang. The Post-Impressionistic lens is still better. But the Howlands regard Post-Impressionism as anti-social, because rampantly subjective; and they disapprove of me for the same reason.

Yes, their keen and practical eyes have discovered a fact that I have tried to hide under a showy robe of intellectual interests: that I am a social failure. I am a lamp filled with oil—yet giving no light.

Sometimes, indeed, I am moved to defend individualism by means of an a, b, c, statement of its creed. If everyone, I tell him, would attend to himself, try to be someone Large and Forceful, society would not need the uplift. But Mr. Howland is never impressed. "And what of it?" he demands. "Après cela? Everyone doesn't attend to himself. There are a great many unattended-to-selves about. I can't see that you get anywhere with your point of view. I tell you"—warming up—"it is coöperation and constructive social work that are turning out the strong characters to-day. If you yourself now would only go into such work——"

Secretly, I am trying to acquire the social point of view. For at heart I am convinced that Mr. Howland is right. I have borrowed and read most of his books on politics, the labor unions, socialism, syndicalism, and the race problem. I shall join an Equal Suffrage League. There are times, it is true, when I feel that the First Cause never designed me to be socially effective. Somehow, it is hard for me to feel that I am someone Large and Forceful where there are a great many strange people everlastingly bustling about. Maybe, however, I can second motions, or distribute tracts upholding equal suffrage to the men on polling days. I am resolved not to remain a failure. There is one advantage connected with the social point of view. It grants what Mr. Howland calls a "variable character." Individualism and all other vices may be eradicated. With Emerson, on the other hand, the soul is as static as a bit of crystal. There may, therefore, be in me the same glowing possibilities that Mr. Scudder saw in the insignificant town of Eden when he pointed it out to Martin Chuzzlewit with the explanation: "It ain't all built yet. Not quite."

Art in Black and White

By William Aspenwall Bradley

[Mr. Bradley is known to our readers as a contributor of articles on literary and art subjects, and as the author of a biography of William Cullen Bryant and an *Introduction to the Correspondence of Sir Philip Sidney and Hubert Lanquet.* Mr. FitzRoy Carrington, whose appointment as Curator of the Boston Museum's Print Department, and as Lecturer in Harvard University, gives especial point to Mr. Bradley's article, is the editor of the *Print Collectors' Quarterly,* and has recently edited a volume of essays entitled *Prints and Their Makers.*—EDITOR.]

The educational value of etchings and engravings as a general esthetic discipline and introduction to the study of fine arts has long been recognized. Not only thru the simplicity and the conventionality of the means employed do prints, next to original drawings, afford the most intimate insight into the mind and soul of the artist, but for the same reason — the reduction of the whole problem of representation to purely abstract terms of black and white, line and mass—they materially aid analysis, and lead to a better understanding of the ends and aim of all art. No one who has studied prints with intelligent interest and conscientious care will ever again be easily seduced by mere richness of color or by a facile illusion of reality into accepting clever tricks for the qualities of great or even true art.

FITZROY CARRINGTON
From the drawing by William Strang.

Moreover, etching, engraving, and lithography being reproductive arts, prints exist in considerable numbers and thus enter into general circulation. In this and in the consequent automatic limitation of price, they have a great advantage over original drawings. Indeed, prints may truthfully and suggestively be compared with books; and a collection of prints, which can so easily be made at relatively so small a cost, and which gives such opportunities for the minute inspection of works of art, may be regarded as, to all practical intents and purposes, a library.

It may seem strange, then, that more has not so far been done in this country to facilitate the study of the engraving arts in library collections of prints systematically assembled to illustrate the history of these arts throughout their entire course. Important collections exist, it is true, in some of our museums and libraries, but as all but the best of these have grown up in haphazard fashion, mainly thru gifts and legacies of private individuals, who collecting primarily for themselves, have naturally followed the lines of their own personal tastes and preferences, it is not too much to say that there is not a single collection in America that can be regarded as completely representative. Those rich in some one department are

comparatively poor in the others. Thus the New York Public Library has a superb collection of modern etchers in the collection bequeathed by the late Samuel P. Avery but as yet the works of the old masters are slenderly represented. The Fogg Art Museum at Cambridge is well supplied with groups of these but falls behind in the modern schools.

Now while such partial collections are of great value to specialists, they are of no particular assistance to the general student, who cannot well be expected to travel from city to city in order to complete his survey of the subject. "What the museums yonder should strive for," wrote Dr. Wilhelm Bode, the famous director of the Kaiser Friedrich Museum of Berlin, returning from his recent visit to America, "are systematically assembled collections of engravings"; and, according to this distinguished authority, there is but one institution in the United States that has already made a good beginning in such a direction.

The fact that the institution to which Dr. Bode referred is the Boston Museum of Fine Arts gives significance to an announcement made thru the Museum's official organ, the *Bulletin*. From this it appears that for some months past, friends of the Print Department of the Museum "have been considering means to develop its influence and to bring it into closer relation with the Fine Arts Department of Harvard University." Realizing that "the United States should possess a print collection worthy of comparison with the great collections abroad," and feeling "that the Boston collection offers the best field for development," they have raised an endowment fund which makes makes it possible to add Mr. FitzRoy Carrington, expert and partner of the late Frederick Keppel for the past fifteen years, to the Museum Staff as Curator of the Print Department, and organizer of the new campaign of expansion. Mr. Carrington has also been appointed Lecturer on the History of Engraving in Harvard University, where he will deliver each year a course of lectures on prints, besides the informal talks which he is to give to students in the galleries of the Boston and Fogg museums. *The Print Col-*

lector's Quarterly, which Mr. Carrington started two years ago with the Keppel imprint, will continue under his editorship, and will be published by the Boston Museum.

What makes the Museum's announcement of particular interest is made an interesting analysis of its contents. The gift of a single print, in 1872, constituted the entire collection until 1874, "when the bequest of Charles Sumner"—the great orator and statesman who, during a breakhim for a time from his public duties,

TURNER'S LITTLE DEVIL'S BRIDGE

"This plate, both as etching and engraving [here the etching is reproduced], ranks among the very finest of the Liber. The etching is very striking." So writes W. G. Rawlinson in *Turner's Liber Studorium,* p. 44. Courtesy of Frederick Keppel & Co. Etching one of Boston Museum's treasures.

the statement with which it concludes to the effect that "the Department [of prints] will be well equipped to coöperate with print-collectors both here and elsewhere, and it is hoped that a national society of print collectors in America may be the outcome of the reorganization." Thus it will be seen that this enterprise—the first full public recognition in America, of the esthetic and educational value of the engraving arts—is not merely local, but national. This fact will have the immediate effect of awakening interest in the Boston collection—consisting over sixty thousand prints.

In a recent number of *The Print Collector's Quarterly,* Mr. Francis Bullard of Boston, one of the Museum's principal friends and patrons, gave the history of the collection, and became interested in collecting prints and who even wrote a pamphlet on *The Best Portraits in Engraving*—"swelled the number to 85 prints." By 1897 the Museum already had the finest public collection in this country, but in that year the removal of the Gray Collection to the Fogg Art Museum by the terms of the will of its former owner, reduced it to about one quarter of its size, deprived it of nearly all its best examples of the works of the old masters, and left it for the most part with only prints of modern origin. The collection as it stands today, therefore, is almost entirely the creation of the last fifteen years during which period it has more than recovered its numerical strength, while its representative character is greater than ever.

The twenty-five thousand Japanese

prints form a separate collection in the keeping of the Department of Chinese and Japanese Art, but outside of these, virtually every phase of the history of the engraving arts is represented by the Print Department, from the first efforts of the early German and Italian schools, down thru the Dutch and Flemish landscape etchers and French portrait engravers of the 17th century, to the great revival of painter etching in France about 1830, and the work of more recent masters, French, American and English.

Nor is the Museum lacking in its particular treasures, its rare states and fine impressions so dear to the connoisseur and collector. " . . If a visitor should enter the Study Room of the Print Department, where the treasures are locked up behind oak doors, what should he ask to see?" writes Mr. Bullard. "Ask, he suggests:

for Pollaiuolo's *Ten Nudes Fighting in a Wood,* a fine impression; Mantegna's *Seated Madonna,* likewise very fine and rare; *The Flagellation;* and *Christ in Limbo.* There are many other Mantegna prints, but these are the most noteworthy as regards impression. Marcantonio's *Massacre of the Innocents* is in the rare first state and is a beautiful impression. The Museum is rich in the number of prints by Marcantonio, but the quality of the impressions is often far from satisfactory. The set of Durer's *Little Passion,* engraved on copper, is one of the finest in existence. The first state of Rembrandt's etching, *Jan Lutma,* is really superb, and there is an interesting print in the third state of the great *Crucifixion.* There are some fine impressions of Schongauer and a splendid impression of *The Adoration of the Magi* by Lucas Van Leyden. The Museum has some excellent impressions of Nanteuil's engraving, and possesses *Guillaume de Brisacier* engraved by mezzotints after Constable, in the proof rich in the engraved work of Turner. The Daumier Collection is most interesting. There is an almost complete set of Charles Jacque's etchings. There is a fair collection of Meryon, but alas! very few of Whistler's etchings. A very fine set of David Lucas's mezzatints after Constable, in the proof state, has been lent to the Museum for an indefinite period.

If the visitor still has time on his hands, let him ask for the Andreani prints on greenish paper, after Mantegna's designs for the great cartoon of the *Triumph of Caesar.* The cartoons are now at Hampton Court. The Durer woodcuts and Durer engravings are good, but I think not so fine in quality as some of the impressions in the Gray Collection at the Fogg Museum. The Little Masters are well represented in Boston, but the visitor should go to Cambridge to see the prints by Schongauer and some very rare early Italian engravings.

It may be expected, now, that a systematic effort will henceforth be made to increase both the quality and the quantity of the Boston collection as a whole. Already there exists a fund of $25,000, the interest of which is devoted to the development of the Print Department. Already, also, there is established a friendly intercourse between the Museum and Harvard University thru the Fogg Art Museum, so that the ground is prepared in advance for future progress along these lines. Thus the success of the new enterprise seems assured. The size of the fund which is now being raised, $150,000 (of which $100,000 has already been subscribed) is a sufficient indication at once of the importance which is attached to the project by its patrons, and of their intention to carry it to completion on a generous scale of support.

Those who appreciate how much the success of any enterprise depends upon the character of the man chosen to conduct it, will be particularly interested to learn something of Mr. FitzRoy Carrington, the newly appointed Curator, who, in replacing the present incumbent, Mr. Emil H. Richter, retains, however, the latter as his associate. The fact of Mr. Carrington's selection for this important post is in itself the best proof that he is regarded by those qualified to judge of the requirements as the best man available—and not only in this country, either, for it would doubtless have been by no means impossible to secure the services of an excellent curator with experience gained abroad.

Mr. Carrington received his train-

ing from the late Frederick Keppel, with whom he was associated in business for twenty years, and by his own efforts as an enthusiastic lover of prints. His opinion as an expert is highly valued and widely sought to-day by the great connoisseurs and purchasers of prints who, scattered over the country, are forming those wonderful private collections which are the admiration of Europe, and many of which will, no doubt, some day also find their way into our public institutions. On the other hand, the purely business side of Mr. Carrington's experience should be of the greatest assistance to him in the organization of his department at the Museum as well as of the national aspects of the work as an educational campaign to spread the love of prints in this country.

Just as Mr. Keppel used to spend no small part of his time in traveling about the country and delivering lectures on etching and engraving, so Mr. Carrington has written many articles on the same subjects and has become known to the larger public thru varied and important editorial work.

Business Poise

Epicures of Work—Their Secret of Success

By William Frederick Dix

Downtown every business day, in the financial district of New York, amid the soft whir of countless stock-tickers and typewriters and the hum of ceaseless, intense activity, rising softly from the streets below, in various beautiful and dignified board-rooms and luxurious private offices, to which access is as difficult as the apartments of royalty, little groups of men are meeting, sitting together for a few minutes, separating and meeting again. These men are, for the most part, middle-aged or elderly, quiet in garb and demeanor, serene of face and manner, unworried, unhurried and good tempered. Each has an office of his own where there is little outward sign of business—usually a simple room, large, quiet and well-lighted, furnished with a few rich rugs, a mahogany desk and several leather-upholstered chairs only—and where he spends an hour or so now and then between the meetings, several of which he attends each day. The meetings themselves are usually held in spacious "board rooms" whose chief furnishing is a long mahogany table spread with writing pads, blotters and a few reports and about it are mahogany arm chairs. Silent, uniformed watchmen stand at the doorway, who salute the chosen few who enter.

If the meeting is called for eleven o'clock, there will be no one in the room at five minutes before then. A minute or two later a secretary, with a portfolio of papers, will enter and arrange his place next to the big chair standing at one end of the table. As the clock strikes the hour, the president of the board will be in his big chair with his gavel in his hand and most of the other chairs will be occupied. If it is winter, fur-lined coats, hats, gloves and sticks will be on the side tables or divans and most of the chairs will be occupied by these unhurried, pleasant-faced gentlemen. The watchman at the door would be considerably surprised if he had to open it to let any one in three or four minutes after the hour. As the clock finishes striking eleven, the president asks the secretary to read the minutes of the last meeting and usually before the clock strikes the half hour following, the secretary has gathered his papers into his portfolio, and distributed his twenty dollar gold piece. The gentlemen are putting on their overcoats and chatting with each other for a minute or so about politics, the opera, European travel or golf.

They have perhaps just invested four or five million dollars during the sitting or changed the policy of a railroad or planned a campaign for the development of a business in South Africa or arranged to issue fifty millions of bonds. Perhaps they have adopted a scale of wages that will affect the prosperity of thousands of families or deposed a president of a great corporation, or, by scrutinizing, with incisive skill, carefully compiled reports, digested the salient points of weakness and strength of a great industry. And there has been no wrangling or oratory or temper, only a little subdued conversation, pertinent questioning, competent answers and quick decisions and perhaps a flash of humor now and then in some apposite jest.

These men, when they are in their own offices, have no routine work to do. They have risen above details. In their earlier years they may have toiled ceaselessly, fighting their way upward from the ranks of countless others of equal chances of success, now outstripped and left far behind in more or less obscure positions in railroads, banks, mills and merchandise establishments. From all parts of the country they have gravitated to

New York, their lines of individual activity growing closer and closer together as their spheres broadened, till they are now meeting almost daily, these master-workers, in the center, the focus of the fiercest vortex of activity the world has ever known. And the men they have left behind look far more battered and wearied by the struggle than they.

Now in their quiet offices, free from the click of typewriters and turmoil of trade, they sign a few letters brought to them, scan reports and consult as to general policies and principles of their vast affairs with junior partners and other master-workmen. Their secretaries keep their papers accurately filed and all detail work is relegated to others. Their trained minds work easily, like perfectly running machinery. Life-long habits of thought and a rich store of experience enable them to think out their problems almost automatically with little seeming effort.

What is the quality that has brought them to this end? Genius? Many of their previous associates had as much. Energy? They surely have not overspent theirs. Influence or pull? Inherited fortune? Many of them started at the lowest rungs in the ladder. Something far more subtle, and which can only be described as business poise is the secret of their success, a business poise combined with a certain clearness of insight or a sanity which has enabled them to avoid every unnecessary effort and make every stroke tell. They are the epicures of work who never let a lesser effort take the place of a greater one, epicures who chose always the highest and concentrated upon it. They kept constantly on the main-line track and forced everything else to take the siding as they swept by. They made themselves masters of their own line, were always "on time and right" and they arrived, not exhausted and in sad need of repairs, but in a state of the highest efficiency.

A man has business poise when he, first, sees his goal as a definite, tangible thing, and second, allows nothing to obscure that vision. Pettiness, over-sharpness, small jealousies, haggling over details, small worries, meanness, never bring this quality of character. A man must have a breadth of view which will enable him to see the opponent's side of a controversy and have a respect for it, must be generous so as to build up business friendships and a confidence as to his honor. When he has made a mistake, he must immediately rectify it and not try to hide it. He must dare to venture but he must not be foolhardy. He must see more than a fighting chance, and then *fight*. He must be self-confident, but his self-confidence must be born of self-knowledge and not self-conceit. He must be constantly on the alert to learn and draw his facts from every honorable source. and, chiefest of all, he must avoid anger and malice and all trickery as he would the plague.

Man may sometimes achieve a meritricious, false kind of business success by dishonorable practices, but his crown is tinsel, his associates know it is tinsel while he wears it and it will crumble sooner or later. The newspapers have frequently told the story during the last few years of fallen pretenders who left broken banks and financial panics and suffering in their wake. Theirs was the false kind of success.

Business poise, so strikingly shown in the personal characteristics of the master-builders is not, fortunately, monopolized by the few. It may belong and it does belong to less eminent but successful workers. Many a man of comparatively small affairs—heads of small but solid businesses, heads of departments, individual workers of every sort in professional and business life have it to a large degree and these men work with joy and comfort. These men not only earn a living, they live a life. Life is sweet to these men, it is sweet and rich and full of zest. Their day does not merely mean the office day with the home and diversions of family and friends but trivial incidents in comparison,

Life with all its beauty is consciously present with them always.

A man's engagement to teach his boy how to use a camera or shoot a rifle late in the afternoon should be quite as important as a directors' meeting. That boy is eagerly awaiting his father's return, he is tingling with eagerness for that appointment and a boy's youth is all too short and therefore most precious to the right kind of a father. The man of poise gains it and keeps it by constantly refreshing himself with recreations which recreate him, and travel, art, letters, music, a love of nature freshen his soul and help him keep a true balance with life.

Most of these master-workers will have some hobby which is quite apart from their business or professional life. One collects scarabs, another knows every eddy of certain trout streams, another raises orchids or breeds hunting dogs or has formed a library which he really reads. And last of all, the successful man is a successful home-maker who gives to his family not a nervous, jaded, absent-minded interest, but the enthusiasm and love of a perennial youth of spirits.

The young man, who is a clerk doing routine work, may just as truly have business poise as the president of the corporation, but if he has, he will not long remain a clerk. The trusted, confidential bookkeeper of elderly mien who hasn't been late at the office for a quarter of a century is a useful spoke in the wheel, but he is only one of countless others and has never had sufficient outlook in life to be anything more. He has no conception of the richness of life, no matter how faithful he is. Ambition does not know him by sight and Opportunity has long ago passed him by.

The qualities which bring wide recognition—vast energy, brilliant talents—are naturally given to the few only, but business poise is not beyond the reach of any man, and even if he does not achieve mastership in the professional or business world, he may, with this elusive attribute so order his life that, on each side of the office door, he will find the world a thing of beauty and make each year prove to him, as he grows older and mellower, the immortal truth that "God's in his heaven, all's well with the world."

New York City.

The Rover

By John Wallace

Robert Leslie, Robert Leslie,
Where hast thou been faring?
Every land is home to thee,
Heaven is thine own roof-tree,
Thou, for wealth or poverty
Little caring.

Robert Leslie, Robert Leslie,
Would I might with thee
Wander round in sun and rain,
Face the salt blast of the main,
Then come roaming back again,
Ever free.

Robert Leslie, Robert Leslie,
Hast thou found that strand
Where the world is ever fair,
Where contentment fills the air,
Where they know not Daddy Care?
Blessed land!

Robert Leslie, Robert Leslie,
Be advised by me
Youth, ye know, is fleeting fast,
Barren age will come at last,
Soon or late ye must tie fast,
Grudgingly.

Robert Leslie, Robert Leslie,
When thy blood is cold,
Will the past years comfort ye,
Will the sights of land and sea
Keep thee out of misery,
Sad and old?

Robert Leslie, Robert Leslie,
When thy hair is gray,
Who will meet thee at the door,
Who will teach thee baby lore,
Or weep when ye return no more
From far away?

New York City.

Literature

A Boy at Brook Farm

"We love to chew the cud of a foregone vision," says Charles Lamb. Many men and women of this primitive taste have come to the front in the last fifty years to tell the tale of that cheery vision of a Fourierite heaven called the Brook Farm Community, which later became the Fourierite Phalanx. None have given a more attractive or more illuminating picture of the community as seen and shared in by its younger members than John Van Der Zee Sears, whose name indicates his Dutch-English ancestry, strained thru Albany and Cape Cod.* Coming down from the Walloon colony in Albany to New York, to attend the May meetings of that old time, the family became acquainted with Horace Greeley, and fraternizing with the reform anti-slavery element, sent their boy of eleven or twelve and his sister as pupils under suzerainty of George Ripley, Charles A. Dana, mighty scholars, and Charles Hosmer, farmer, to share the advantages of that remarkable band of scholarly reformers in the study of man and nature at first hand, hard by the little brook near Boston.

The brook and its neighborhood sizzled with reform of a beautiful kind. Emerson and Bronson Alcott and Thoreau were near at hand in Concord, Theodore Parker and Margaret Fuller close by in Boston, and all could be seen from day to day taking their Sunday walks communityward. The boy of eleven, after a grouchy day or two, took kindly to the farm life, succeeded Nathaniel Hawthorne as Mr. Ripley's assistant in milking eighteen or twenty cows and clearing out the stalls, turning over that heap of steaming gold of which Hawthorne makes some readable fun in after years, washing his hands and, with Mr. Ripley, joining the young and pretty housemaids at the second table for breakfast by 8 o'clock. Pupil and companion he was of men who were destined to a large loom in the after history of letters and policies and soldiering. Curtis was there, who later refused ambassadorships; "Craze" Barlow, a boy whose impulsive offishness was of service in storming Lee's army at Cold Harbor, a service that made him a major-general; Hecker, later to be "Father Hecker," founder of the Paulist Fathers in their New York activities; Orestes Brownson, whose statue shores up the Riverside Drive in New York. These were a few members of the new socialistic democracy of life and letters on the farm or in sympathy with it, for whom the boy milked the cows, aired the steaming gold, led the dance—after he had washed his hands—joined the maids, when the bibs and pinafores were laid aside, for the piano or the newly arrived toboggan slide, and kept his eye the while on a pretty lodestar of ten or thereabouts that rose above the horizon and was ascendant for the next three years.

From Mr. Sears's point of view we get the fullest picture that has yet been framed of the inner life at the farm. With this pretty lodestar always in sight, it was natural that everything should be rosy. "I liked the work," he says, "liked the cows, and especially liked to be with Mr. Ripley. His flattering report that 'Cedar' could 'milk like a shark' secured for me the maximum wage, ten cents an hour." All shared in the duties and privileges, and looked up with surprise when some advocate of "equal rights" came one day to tell them that they were downtrodden and should assert themselves. All the "reforms" were there already. When the gray squirrels ate the outer rows of

*My Friends at Brook Farm. By John Van Der Zee Sears. New York: Desmond FitzGerald. $1.25.

corn in the field, they recognized the rights of the little beastie, and planted the next year an extra outside row. When an eager desire to study architecture led them to dig down to the bottom of an ant-hill, they apologized to the ants. When a new piano was purchased, but not fully paid for, they all gave up butter and let the "oleaginous compound" go to market until the deficit was made up. A very pleasant picture of associate life the boy of eleven makes, as chewing the cud of a foregone vision he still imagines himself milking those twenty cows.

Imperial Gilbert Parker

Gilbert Parker has an assured place as a contemporary novelist; his tales are distinguished—above all by their human touch. The art of their relator is forgotten in their humor or pathos. They are nearly all concerned with uncovering human hearts, with quickening in human hearts the great or small residuum of decency and of love; and even the scamps are delightful enough to calm the reader's lust for vengeance long before they are laid by the heels. So the stories run true and end as they should without violence to nature or art.

Up there in the Canadian Northwest where so many of the plots are hatched, he discovers a vein of retributive grace. The sons and daughters of England who left the motherland for their mother's good find their regeneration, and sometimes their vindication, in his pages. The tragedies of the younger sons, of the social outcasts, of the fugitives from justice, of the fugitives from self, are vividly sketched or subtly suggested, and in the same novels are developed the raw and primitive emotions and motives of the sons and daughters of the soil—Indians, half-breeds, French pioneers, Scotch settlers, self-sufficient English.

These tales of the Canadian Northwest first saw the light in THE INDEPENDENT. The first story in Volume 1 of the *Works of Gilbert Parker*,* now coming from the Scribner press, is "The Patrol of the Cypress Hills." It was published in THE INDEPENDENT of January 29, 1891, and for five years his stories and articles appeared in this paper at frequent intervals. There are to be eighteen volumes in this fine edition, of which four have appeared. The first three have the short stories, followed by *Mrs. Falchion,* and *When Valmond Came to Pontiac;* and so we fare on to the latest novel, now running as a magazine serial.

These volumes are of the size of the Scribner Kipling and Stevenson, and similar in formal detail; standard octavo, bound in crimson silk, deckle edged, gilt topped, printed upon a dignified modern-faced type. The paper is an antique laid of fair quality bearing the author's initials in its special water-mark — admirable books, considered simply as books.

The American Language

Thornton's *American Glossary* shows a careful search among the phrase-makers and phrase-users of America.† Probably no country in the world delights more in twisting the lion's tail in this respect—the tail being the English tongue. Every shoe-shop in New England, every wayside tavern there and elsewhere has its specially endowed tail- or tongue-twister capable of furnishing a specimen a day.

How far these phrases are inherited, imported, Shakespearean has always been a study among keen lovers of localism in speech. The novelties have their line of travel. In the early days they got sooner or later to the Colonial legislative assemblies, to the Continental Congress. Every delegate or representative going to

**The Works of Gilbert Parker.* Imperial Edition. In Eighteen Volumes; Vols. I, II, III, IV. New York: Chas. Scribner's Sons. $2 per volume. (Sold only in sets.)

†*An American Glossary.* Being an attempt to illustrate certain Americanisms upon historical principles. By Richard H. Thornton. 2 Volumes, Philadelphia: J. B. Lippincott Co. $7.50.

Philadelphia or Washington carried thither his own home bacillus, which expanded rapidly in the capital. Some of these tracks Mr. Thornton follows assiduously. Some he localizes at once in the novels and editorial paragraphs of early newspapers like the Worcester *Spy*. Lowell has chased home to Elizabethan England many scores of the single-word locutions. The late Edward Eggleston was fond of the hunt in this style. In Mr. Thornton's two volumes the search is given an historical turn, the word or phrase chased to its burrow, dated, and tagged as often as it appears above the surface. A most catching illustration with the guilty party in bonds usually leaves the laugh on the culprit. Fourteen thousand such illustrations beguile the reader into too long a tarry in the pages of the *Glossary*.

Literary Notes

Susan Glaspell has collected some of her optimistic short stories in a volume called *Lifted Masks*. (Stokes; $1.) The storyteller is already known and loved for her novel, *The Glory of the Conquered*.

Those who want to see how a public library can be made a center of civic ambition and a help to all classes of the community should send 10 cents for a copy of the monthly *Newarker*, publisht by the Free Public Library of Newark, N. J.

One might call Mr. E. V. Lucas's *A Little of Everything* an auto-anthology; for its purple patches are gleaned from novels, travel-books, juveniles, verse, and essays. Most at home, he is, in the last named form, where he can be discussive in his method, and playful to his heart's content. (Macmillan; $1.25.)

The evening when the maid's at church is less of a problem now that we have the fifty-four menus of Alice Laidlaw Williams's *Sunday Suppers*. (Duffield; $1.) Chafing-dish cookery is not neglected—and there are illustrations to tempt the Sabbatarian appetite.

Bible teachers who are working on the first part of the Old Testament will find two excellent additions to their lesson helps in C. H. Corbett's *Old Testament Story* (Univ. of Chicago Press; Manual, $1; Notebook, 50 cents), and *The Making of a Nation* (Scribner), by Professors C. F. Kent and J. W. Jenks. The former contains a series of thirty-five lessons, well arranged for children ten or twelve years of age, and based on narratives covering the period between Moses and David; the latter consists of a dozen serious studies for adults in the first seven books of the Bible used as a basis for considering the living issues of the present. Both books are well supplied with useful references.

Dr. Selina F. Fox's book *Mother and Baby* is practical in text and illustrations. (Blakiston; 60 cents.) The English author shares our objection to the low go-cart, in which the little one is unduly exposed in cold weather, cannot lie down, and receives the maximum of blowing dust.

David Starr Jordan's tribute to Mrs. Jane Lathrop Stanford is entitled *The Story of a Good Woman* and is issued by the American Unitarian Association. (75 cents.) To Mrs. Stanford's spirit of sacrifice in carrying out her husband's plans, Stanford University owes a great debt. The university was, in Dr. Jordan's words, "founded on love."

Dr. Washington Gladden has gathered nearly fifty of his short lyrics under the title, *Ultima Veritas*. (Boston; Pilgrim Press.) Some of these poems, variously religious and pertaining to the Civil War, are very dear to those who have treasured them for years; and we commend them to the multitude who know and love the autnor.

None of the tales collected in the late Myrtle Reed's *The White Shield* (Putnam; $1.50) will ever be included among short-story masterpieces. They are drawing room or parlor stories; lady-and-gentleman creations; their emotions are decorously subdued, their conduct delicately conventional. They are life in weak solution, colored a pretty shade, and put up in a fancy bottle tied with ribbon.

New Light on the Old Truths (Houghton; $1.25), by Charles A. Dinsmore, is a most engaging statement of the modifications of religious faith which have been brought about by modern scientific and historical research. Mr. Dinsmore writes with deep sincerity and reserve power on such themes as the Bible, the Person of Christ, Salvation, and Immortality, interpreting these subjects in language and forms of thought which are bound to appeal to minds nurtured in an atmosphere of free and independent investigation. The substance of the book was originally given in extemporaneous talks to a company of thirty business and professional men, but the written lectures have a genuine literary flavor.

The Routledges bring out an *Introduction to the Poets,* by W. F. Rawnsley (Dutton; 75 cents), which will furnish good biographical matter and a graceful commentary on the English authors usually taken up for reading in social reading clubs. It is a volume of 313 pages. In no case does it give the text of the authors read.

Charming in literary style as also in book making is the volume of magazine essays by Austin Dobson collected under the title *At Prior Park and Other Papers,* imported by Stokes (illustrated; pp. xi, 305). Some of the eighteenth century subjects are Portraits of Carmontelle, Garrick's "Grand Tour," Loutherberg, Some Letters of Fielding's (hitherto overlooked), the Bailli de Suffren, Stowe, Robert Lloyd, and Gray's biographer (Mason.)

The housekeeper who is weary of the ever-recurrent question "What shall I have for dinner?" will be interested in *The Helping Hand Cook Book,* by Marion Harland and Christine Terhune Herrick (Moffat, Yard; $1.25.) It is not a cook book in the usual sense, but a menu book containing suggestions for every meal of the year, carefully planned to utilize all "left-overs" in appetizing form. Recipes are given only for new and unusual dishes.

Mr. Woodrow Wilson, reading Gideon Welles's *Dairy,* was asked if he kept a diary. "No," he is said to have answered. "I kept one for awhile when I was a boy. People usually keep diaries, when they are too young to have anything to put in them. Later, when they have something, they are too busy. Welles says that he wrote his after the day's work—usually betweeen eleven and twelve. Probably his weariness at that hour of the night colored the views he expressed."

Mr. Philip Hale, of the Boston *Herald,* is of opinion that it does not follow, from the fact that Welles wrote his diary late at night, that he was mentally or physically tired. "The change in work was probably a relief, a relaxation. The Secretary of the Navy could sleep better after he had freed his mind on paper. Mr. Welles at a cabinet meeting was often bored, often irritated. It comforted and soothed him to think: 'Aha! There's my little diary waiting for me. To-night I'll get even with Billy Seward.'"

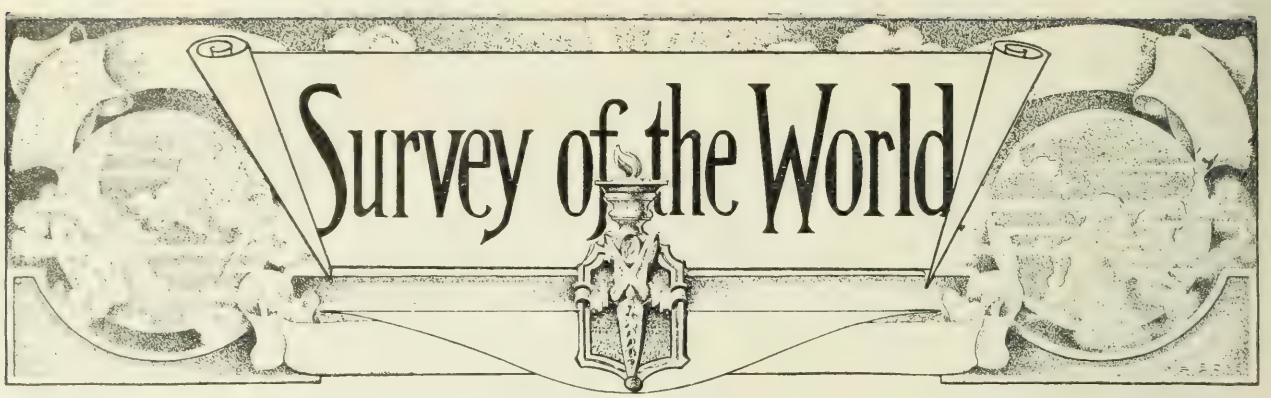
Mrs. Riggs—that is Kate Douglas Wiggins—states that in early days her imagination was stirred by Hawthorne's *Wonder Book,* by *The Water Babies,* by Miss Edgeworth's *Rosamond,* by *The Arabian Nights.* She adds that last summer a neighbor up in Hollis, Me. (her childhood home) told her she would like to read *The Arabian Nights.* "Go thru five or six," suggested the author of *Rebecca.* That was Saturday, and on the following Wednesday Mrs. Riggs again met the Yankee. "I ain't done a mite of work since I last seen yer," she confessed. "Washed jes' enough dishes to git along with. I reckon it is all a pack o' lies, but they're the best lies I ever heard." This is our idea of sound literary criticism.

Salem, Mass., is to be honored with a memorial to Nathaniel Hawthorne. It was in a house on Union street, Salem, that the novelist was born in 1804; and the old Custom House, where he served as Surveyor, stands in Derby street. These are only a few of the local connections between the old town and the man of letters, and the Hawthorne Memorial Association has done well to select as its artists Bela L. Pratt, sculptor, and R. C. Sturgis, architect—Bostonians both. The site favored for the Memorial is on the westerly edge of Salem Common, near the Mall street house in which Hawthorne wrote *The Scarlet Letter.* Harlan P. Kelsey of Salem is secretary of the association, and he it is who will receive the contributions of Hawthorne admirers.

Maurice Hewlett has in his most recent book, *Mrs. Lancelot,* returned to his favorite motive—illicit love. It is a tale of a fine young woman led into matrimony without love, and then assailed by several men, resisting all until the right one comes along and carries her defences with the magnificent rush of the man unafraid of convention. Mr. Hewlett seeks to solace the compunctious reader with a suggestion that thru belated instincts of knightly regard for the dame, on the part of the husband, the lover, who has attained already, may legitimize his passion if he will. Needless to say that there is good writing here. But it is equally needless to say that the flavor of the novel is unwholesome and neurotic. (Century; $1.35.)

Ralph D. Paine's interesting book, *The Ships and Sailors of Old Salem,* first published in 1908, and noticed in THE INDEPENDENT of January 20, 1910, now takes a second wind, with no essential changes. What makes its reissue especially desirable is that status of the Panama Canal treaty lately brought to the fore by the assault on the long accepted interpretation of its terms. (McClurg; illustrated.)

Linda, by Margaret Prescott Montague, is one of the impossible tales which we



would not on any account spare from the book-shelf of romance. It makes us believe the stories of the ethnologists who insist that the "pore" whites of the mountains of the South are lineal descendants of the English of the time of rare Ben Jonson are in fact the only pure English strain we in America can boast. This story is well worth reading. (Houghton; $1.20.)

Miss Alice Brown's story for girls, *The Secret of the Clan* (Macmillan; $1.25) is so clever that one is inclined to suspect that it may be too clever. It will not be the young girls who will have this suspicion; they will be wholly delighted. It has many elements to delight older people, whether or not they may ever have been girls. It is fine and sweet, and a good tale as well—Alice Brown may be trusted for that. The prosaic elders are likely to sigh a bit, over the altogether charming quartet of young girls, and perhaps over the idyllic Grandma, Just-Grandpa, Titania and Uncle Terry. But for what are romantic story-tellers if not specifically to make us all sigh—the young with delight and the older because of experiences and memories?

The *Farmer's Manual of Law,* by Hugh Evander Willis (Orange Judd Company) is a good omen. It is a summary of private substantive law as that may naturally affect the farmer of today, who should be more of a business man than was the farmer of yesterday; public law and the laws of legal procedure and evidence are omitted. Such a book could well be used and should be used in agricultural colleges, and it might well be within cautious arm's length of the farmer—or any layman, for that matter. Its arrangement of the subject matter is good; it uses heavy type for principles, light for illustration and explanation. The style, tho simple, is at times necessarily technical; this is remedied by a glossary which we fear was selected by a lawyer; at any rate it fails one now and then. There is a group of review questions and legal problems, also a proper selection of forms, and the wholesome caution that the intent of the author is to enable the farmer to know his own rights and to teach him not to invade others; not to fit him for practice. When shall we have a Manual of Farming for Lawyers who persist in dabbling in it?

A singer may have a good voice and an impeccable method, and yet leave an audience cold for lack of that power of bringing out of a song all there is in it, that is born in some artists and won by others thru years of experience. Harry Plunket Greene has both the power and the experience, and in *Interpretation in Song* (Macmillan, $1.50) he has produced a book that does as much as any book may do to communicate them to others. While he has evolved a series of rules they are as natural as heart beats, and express with vivid accuracy what great singers can rarely get into words. "Never stop the *march* of a song," is one of them, for the song must "push on, note by note, word by word, phrase by phrase, to its inevitable end"; "sing mentally thru your rests," for the singer begins his song at the first note played by the accompanist and ends at the last beat of the last note of the final symphony; "sing as you speak," for all gifts, all perfection of technique, all observance of rules, go for nothing if the singing be not speech in song. The book is full of musical illustrations, has a chapter on classification that is a real contribution to the psychology of music, and, in general, ought to mean much to singers who have passed the purely technical period of the art.

Two Old Testament additions to the slowly enlarging series of *International Critical Commentaries* are worthy of special notice. The first concludes the work on the Minor Prophets begun by Professor Harper, and covers the last three books of the English version (prepared by Professors H. G. Mitchell and J. M. P. Smith), together with the Book of Jonah, which is properly regarded as a later production. Professor Bewer, who comments on Jonah, gives scant recognition to any historical elements in the book or to the suggested symbolical and allegorical interpretations. He treats it as a parabolic story, "the work of poetic imagination, pure and simple." The other new volume contains the first half of the Commentary on Isaiah, the work on which has been divided between two competent English scholars, Professors G. B. Gray and A. S. Peake. This volume, for which Professor Gray alone is responsible, shows thoro and careful scholarship, excellent judgment in the selection of material, and assumes the general critical attitude and conclusions made familiar by the writings of Cheyne, Duhm, and other recent students, altho the editor does not hesitate on occasion to return to older theories or break new paths of his own. Perhaps one ought to emphasize again the fact that these commentaries are invaluable and indispensable to those who wish to know what the latest research has accomplished in the interpretation of the biblical documents. (Scribner, $3 each.)

Nine Stages in Chinese Reform

In a report on the causes of the late tremendous revolution in China, Dr. Timothy Richard, the distinguished missionary and secretary of the Christian Literature Society, indicates nine stages in the reforms which have marked the late history of China, of which three are of stupendous importance. The first was the reform of 1895-8, in which the young Emperor joined and to which he became a martyr. Ten thousand students signed a memorial for reform, and the Emperor was with them. But he was not as strong as the Empress Dowager, who was controlled by reactionaries, and the attempt was made in the Boxer rebellion to kill all foreigners; over two hundred were murdered and ten thousand native Christians. The result was the capture of Peking by the allied armies and the flight of the Empress and her submission to the principle of reform. The second tremendous reform was the adoption of modern education in China. A modern university was opened in each of the eighteen provinces and the old system of Confucian education was abolished. To be sure the plan could not be immediately carried out fully for there were few teachers, but the beginning was made and the delay was one great cause of the third and greatest of the movements that led Dr. Sun Yat-sen, the revolution which created the Republic of China.

The subsidiary reforms mentioned by Dr. Richard are six in number. The first is the reformed press. Twenty years ago there were only six daily papers in all China. Ten years later they had increased to sixty, and now they can hardly be counted. A second reform is in foot-binding, and has spread all over China. A third was to do with exchange and currency. The scheme to adopt the gold standard was agreed upon after the return of the court following the Boxer rebellion, but has never yet been fully accomplished, much to the loss of the Chinese exchequer. The fourth is the reform in communications, which is engaging the entire attention of Dr. Sun and which involves the creation of a great system of railroads, both north and south and east and west. The fifth is a reform in international intercourse. China is now on good terms with all nations, unless it be with Russia over rights in Mongolia. She stands for peace and arbitration and with the election of a regular President next month to succeed the Provisional President, Yuan Shih-kai, it is likely that the new Republic will be recognized by other nations. The sixth reform is in religion. There is no longer any persecution of Christians. The first President, Dr. Sun, is a Christian; his successor is a friend of Christians and educates his children in Christian schools. There are many societies founded in Peking, Shanghai and elsewhere for the study of religions and they are often addressed by Christian missionaries.

There are many causes for the late revolution. One is the wide distribution of modern literature, another is the inferiority of China as seen in the war with Japan and the capture of Peking by the allies. There is the superiority of railways, steamers, manufactures, western education and the appointment of ambassadors to foreign capitals and the sending of students to America, Europe and Japan. The first year of the Chinese Republic proves that the nation has turned its face fully to the future and can never turn back.

India's New Capital

The dramatic announcement by King George at the Delhi Durbar [see THE INDEPENDENT, Dec. 21, 1911] that the capital of India was to be changed from Calcutta to Delhi was generally interpreted as a rebuke to the Bengalis for their anti-British agitation which had frequently found expression in riot and assassination. It was generally feared that the nationalists would

seize this occasion for an attempt upon the life of King George, Queen Mary or the Viceroy, Lord Hardinge, and great relief was felt when the ceremony passed off with nothing worse than that one of the native princes turned his back upon the King-Emperor.

Evidently, however, the disaffected Indians preferred to choose their own time to strike, and they found it on December 23, when the Viceroy made his state entry into the new capital. In spite of the careful police precautions Lord and Lady Hardinge narrowly escaped death by the explosion of a bomb thrown at their howdah as they rode on an elephant thru the principal street of Delhi. The streets had been lined with soldiers and every householder along the route of the viceregal procession had been required to sign a guarantee assuming responsibility for all persons using their rooms. Two Indian police officers, with loaded revolvers, walked on either side of the elephant. A grove of pipal trees occupies the center of the Chandi Chauk, so here the procession had to pass close to the houses on the side, and from the verandah or roof of one of these the bomb was thrown. It struck the handle of the State Umbrella, hhich the Jemadar of Elephants held over the Viceroy, and burst, killing the Jemadar and a boy in the crowd below and wounding the Viceroy and eleven other persons. One man standing twenty yards away was seriously injured by the flying fragments of metal. The mahout driving the elephant kept him steadily on his way for 150 yards.

Nails, slugs and screws from the bomb were embedded in the Viceroy's shoulder, back and neck, but when Lady Hardinge asked him, "Are you hurt?" he answered, "All right; go on." Lady Hardinge said: "We cannot go on; there is a dead man behind." Then the elephant was halted and the

King George and Lord Hardinge reviewing troops at the Delhi Durbar of December, 1911.

Viceroy, who had fainted, was with difficulty lifted to the ground.

Rewards of more than a lakh of rupees have been offered by the government and by the native princes for the discovery of the assassin, but no clue has yet been found which would indicate either that the conspiracy was very skilfully planned or that there is more d'saffection in Delhi than had been supposed. In that case the change from "the hotbed of sedition" at Calcutta would not greatly increase the personal safety of the ruling caste of British officials. The other reasons which have been suggested or surmised for the removal of the capital are that Delhi has a better climate; that it is nearer Simla, the summer resort; that it is protected from attack by sea; that it will allow Bengal to develop local self-government, and that it indicates an intention to bring India into closer touch with Europe by opening the "back door" to the westward. If there is any truth in this theory the change of base may be as important in its effects as the transfer of the Russian court from Moscow to St. Petersburg and the movement of Austria toward the east.

In the construction of the new capital $20,000,000 is to be spent on the start, and there is a hot discussion now going on in the London papers as to what style of architecture should be adopted. On one side it is urged that it is a British city to be built by British architects, and that it should therefore be constructed in the English style of the twentieth century—whatever that may be. Some argue for the Gothic, some for the Greek, some for the Renaissance and others insist that a modified form of one of the native Indian styles would be more beautiful, appropriate and suited to the climate.

Irish Lace Making

Hand in hand with the present agricultural regeneration of Ireland, thanks to more liberal legislation, has come an interesting revival of the cottage industries in Erin, and especially the lace making art. This development of lace making in the homes is to be attributed as much to the introduction of improved methods of marketing the lace as to added facilities for manufacture. The new status is especially welcome to the cottage workers, however, because the bettered means of livelihood insures to them continued possession of those modest dwellings to which they cling with a loyalty and tenacity which bespeaks a sentimental race.

Every traveler who penetrates to the remote or isolated sections of the mountain regions of Ireland—truly among the least-traveled of European tourist paths—is impressed by the exquisite examples of the most delicate lace produced in the unpromising surroundings of wayside cabins by girls who can devote to the task only such hours as they can spare from work on the farms. The mere problem of preserving

spotless these fabrics of cobweb-like texture seems most formidable, especially when it is taken into consideration that the work is tedious—as much as six months being devoted to the evolution of an elaborate design. That such lace making survived as a household art thru years of meager monetary returns would seem to afford eloquent testimony to the artistic ideals of its devotees, and it is therefore a matter of satisfaction that what was for so long little more than a labor of love is at last receiving substantial recognition.

A number of movements, each distinct in character, but all sympathetic in purpose, have coöperated to bring about the new era of Irish lacemaking. In most instances these efforts have not been limited to assistance to the lace makers of the cottages to reach markets worthy of their work. Going back of that to the very foundations of the industry, these new-found influential friends of the peasant workers have established free schools and country lace classes, where the rising generation may become well grounded in the art and where even the experienced workers may add to their knowledge. All this has been done, too, in an intensely practical manner for, with due regard for the poverty of many of the aspirants, arrangements have been made to provide not only free instruction, but patterns and materials for the use of the workers.

In furtherance of this happy combination of instruction and sales promotion important work has been done by the Gaelic League, an organization which has as its primary purpose the preservation of the Irish life and language. Sir Horace Plunkett was instrumental in other means to the same end by nurturing the idea of coöperative associations among the cottage lace workers. Lady Aberdeen, meanwhile, in conjunction with other public-spirited individuals, evolved the best plan yet devised for marketing the cottage-made lace to advantage and the philanthropy of purpose has been attested by the fact that all the profits accruing have been employed to develop the lace industry and to improve the condition of the workers. And finally, that unique Irish governmental institution, the Congested Districts Board has lent a hand. Thruout the "congested" or unproductive districts of bleak and barren western Ireland, where the Board is charged with the mission of the uplift, free lace classes have been established and suitable designs have been supplied to the workers, whereas the Board has undertaken to see that the lace is sent to the most profitable markets and that the toilers of the cottages receive the full reward of their industry,—something that, unfortunately, was far from true under the old conditions, wherein the lace found its only outlet thru local shopkeepers to whom, in many instances, the poor lacemakers were ever in debt for materials.

WALDON FAWCETT.

Scholars and Sports

Harvard College statistics reveal the fact that the best scholars come from high schools. Harvard provides an uncommonly attractive field for the statistician who would compare the results of "public" and "private" school education, for the entering classes are recruited almost equally from the two types of institution: in that of 1916, for example, 291 boys come from academies and preparatory schools, 287 from public schools. The sporting statictics show that of 197 "H's" won in football, baseball, rowing, and track

athletics, in five years, 69 per cent. were won by boys from private schools, and only 27 per cent. by boys from public schools. Four per cent. were contributed by students entering Harvard from other colleges. Tho football teams and crews at Harvard depend almost wholly upon the service of "students" furnished by St. Paul's and Groton and Andover and Exeter and the various other private schools, the high school graduates are almost as proficient in baseball as their rivals from secondary institutions which charge tuition to doting parents, and on the track, too, the high school boys are reasonably proficient. The privilege of gaining honorable bruises and fractures on the gridiron is, then, more aristocratic than that of scoring points for the 'Varsity in the sprints and at the crossbar. The following table of percentages shows how the private school and public school boys at Harvard divide honors in the four major sports:

	Football.	Baseball.	Crew.	Track.
Private school ...	85	51	84	59
Public school	13	47	16	31
Other colleges	2	2	..	10

The Recall in Action

The initiative, referendum and recall are the three cardinal instruments of the New Democracy. The initiative and referendum are already in use in one form or another in almost all of our States. The recall is a newer measure and unlike the initiative and referendum is of American origin, having first made its appearance about a dozen years ago in the Los Angeles charter. Tho the recall soon spread rapidly to many cities of California, Washington and Oregon, it was not until it was incorporated into the Commission plan of government, especially by Dallas and Des Moines, that it reached its greatest vogue.

An interesting account of the recall in action is published in the current issue of *Equity*. It seems that the recall was first employed in 1904 in Los Angeles where a councilman, who was charged with having favored the liquor interests, was removed from office. A second election, however, was necessary to accomplish the removal as the courts on a technicality held the first election invalid. In 1909, in the same city, Mayor Harper resigned his office after a recall petition had been seconded.

In other California munipalities the recall has already been brought into play. San Bernardino recalled two councilmen, Colton recalled three members of the board of trustees, while Santa Monica got rid of an official, who resigned when threatened with the recall. In San Diego, Richmond, Berkeley and Oakland, tho the recall was initiated all the incumbents were retained in office by the voters. Huron, S. D., likewise attempted to oust its entire commission by the recall, but without avail.

Perhaps the most famous case was that of the mayor of Seattle, Washington, in 1910. The charge was made and sustained that he had given aid to the vice element and was co-operating with a privately owned electric plant company in an attempt to wreck the municipal electric light plant, in order that it might be turned over to the private company. In the spring of 1911 Seattle's rival city, Tacoma, recalled the mayor and two commissioners on the grounds of inefficiency. The mayor had refused point blank to enforce the civil service law.

During the past few years Everett, Wash., recalled a councilman for his action in regard to a franchise; Estacada, recalled all the elective officials, with the exception of the recorder for gross incompetency; Junction City, Ore., recalled the mayor by a vote of four to one; Dallas, Tex., recalled members of the school board on two separate occasions; Shreveport, La., recalled the commissioner of streets, while McAlester, Okla., and Wichita, Kan., recalled their mayors. This fall Lawrence, Mass., recalled a school commissioneer, who had been convicted of having planted dynamite during the textile strike last year.

In Des Moines, Iowa, three commissioners conspired to appoint a certain man to the police marshalship in accordance with a pre-election bargain. Threat of recall proceeding, however, caused them to drop their scheme and appoint a good man to the office. On another occasion a police superintendent of the same city was threatened with the recall by the gambling interests unless he would permit the re-establishment of slot-machines. He immediately informed the newspapers and the resulting publicity rendered futile any further talk of the recall.

No election has yet been held for the recall of a judge. The only attempt was in the case of Judge Coke, of Roseburg, Ore., in July, 1911. In presiding over a murder trial, which had occasioned much popular excitement, it was charged that he had shown favoritism to the defendant. The friends of the man who was killed started the petition, but were unable to secure even one-half of the necessary 25 per cent of sig-

natures. Even the public prosecutor of the case refused to sign the petition on the ground that the judge's fault was of the head and not of the heart.

All the above instances of the recall in operation are local, but already Oregon, California, Arizona, Arkansas, Idaho and Colorado, and, we believe, Nevada, have a State wide recall whose scope includes practically every elected public official in the State. North Dakota and Wisconsin have also recall amendments which have passed the legislators, but which must be voted on by the people, in 1913 and 1914 respectively, before they can become law. So far the recall has not been attempted on a State-wide scale, but this condition of affairs is not likely to continue long and then we can have an excellent test of the real value of this most interesting political measure.

News About Beeswax

Altho the hive-bee has been studied ever since they began to gather its honey on the heights of Hynettus, it appears that various things remain to be learned about this lively insect. Just now an entomologist in Texas, Prof. D. B. Castell, of the State University, informs bee-keepers that he has solved several problems connected with the formation and handling of the comb-wax, such as how the wax is removed from its place of secretion; whether each bee does its own work or is cleaned of wax by another; whether there is in the hive a non-secreting class of workers who devote themselves wholly to building operations, etc. Dr. Castell patiently studied the bee at work through a glass-sided observation-hive, using a magnifier thru which the insect appeared "to acquire the dimensions of a large-sized rat." Hence all its movements could be watched and sketched with precision.

Beeswax is a secretion of eight glands lying on the floor of the abdomen, a pair on the front part of each of the last four segments—one on each side. Each of these segments partly overlaps the one behind it, and the hidden portion is a smooth surface or plate, divided in the middle. These eight plates are perforated with many minute holes thru which the fluid wax secreted by the gland beneath each exudes as it is made, and hardens on the plate into a little sheet or "scale," which when complete protrudes a trifle from the space between the segments, or "wax pocket." This wax is produced only by the workers, and by all workers at some time in their life. When the workers are young, however, they have little or no secreting power, and as they grow old it declines and disappears. Thus while the old opinion that some bees in each hive produce no wax is true, the explanation is that such are either too young or too old, not that they lack organs.

On every worker-bee's hind leg, between the second and third joint, is a structure consisting of a comb-like affair on the tibia meeting, when the leg is flexed, a knife-like projection of the planta. This has been likened to pincers or shears, and has hitherto been regarded as the instrument with which the insect seized and withdrew the wax from its pockets. Castell finds that it has nothing to do with wax-removal, but is concerned in pollen-gathering. What really happens is this: a bee loaded with wax will settle upon a piece of new comb, brace itself upon three legs, with its two front ones held up near its mouth to serve as hands or as the paws of a squirrel nibbling a nut; with its hind leg lifted and bent in against its abdomen, it then scrapes downward with the planta (the large terminal section of the leg), the lower margin of which is set with stiff spines. These spines prick into the edge of a scale and drag it out. The hind leg is then bent up to the mouth, and freed of the scale sticking to it by the jaws, aided by the front feet. This is the whole process, more or less perfectly carried out, for sometimes a scale fails to be drawn out whole but is rasped away in pieces. Scales sometimes drop from the body, or are fumbled in the jaws and fall to the floor of the hive. To these the owner seems to pay no attention, but sooner or later some other busy worker will pick them up and put them to use. The scales of wax are not at once applied to the growing comb, but are first thoroly masticated and mixed with saliva; nor even then is the job completed, for the material of the comb is re-chewed and kneaded over and over before regarded as of the right consistency to form finished comb.

The People's Mountains

A movement is definitely on foot which will eventually return the American mountain summits to the people. Strange to say, the common law has preserved to them as inalienable public property all bodies of inland waters above a certain acreage, and has at the same time lost to them the still more important sources of most of our perennial streams, together with the surrounding forests and the natural recreation grounds of the people. The medieval, feudal need for the inaccessible castle may have been responsible for the disappearance of the more primitive order of things. At any

rate, the impressive features of the landscape have, for the most part, been commercialized, and the Saxon communal instinct is in constant danger of being offended by a legal order barring the way to a commanding summit.

It is fortunate that this hereditary craving for the hills is so strongly fortified by reasons esthetic and economic. It is getting to be felt that it is well-nigh criminal to let any natural monopoly of beauty or grandeur melt away before private advantage or be ruined by human greed. But doubtless the economic argument for public ownership of the mountain summits will prove the more effective in securing legislation for the preservation and regulation of flowing streams and for the prevention of forest fires. The practical logman, as well as the mill owner, the manufacturer of electric fluid and the navigator find useful a constant stream. The wise concentration of all such interest, has at last awakened the zeal of the private philanthropist and secured considerable practical State legislation as well as national.

The movement counts on the increasing aid of all three factors. It looks eventually for the public control of all elevations two stool; a paperbasket. (The room is nine thousand and more feet above the average level of the particular Commonwealth involved. The United States may well care for all such heights feeding navigable streams flowing through two or more States. The spur for State legislation along this line is coming from conditional individual gifts. A half dozen public spirited givers in any Commonwealth, each buying a mountain summit, fitting it out as a public park and endowing the same, would be sure to succeed in getting their legislature to undertake to duplicate all such gifts and in the end to possess all the mountain summits in the State. HENRY W. HULBERT.

School Economics

In our issue of December 5 we had an editorial on "Student Expenses" which has attracted some attention, and a letter received from the Alabama Girls' Technical Institute tells us how they have solved the problem of expense, where economy is a matter of prime importance. For 475 teachers and students the total charge for a session of 36 weeks for board, lodging and laundry is $100, about $2.80 a week. An Alabama pupil can cover all necessary expenses whatever, including books, society fees, medical attention, everything but railway fare, for $150. Being a State institution, there is no tuition. The students are not at all skimped in food. There is sent us the m nu for a week, of which we give space for two successive days, to show the variety which runs thru the week:

MONDAY.

BREAKFAST.

Apples; shredded wheat with cream; meat hash; biscuits and butter; coffee, tea, milk.

LUNCH.

Vegetable soup; Welsh rarebit; celery and fresh pine-apple salad; bread and butter; milk.

DINNER.

Roast beef, brown sauce; baked sweet potatoes; peas; corn bread, light bread; tapioca pudding.

TUESDAY.

BREAKFAST.

Corn flakes with cream; scrambled eggs; rolls and butter; coffee, tea, milk.

LUNCH.

Fish-balls, tomato sauce; steamed rice with brown sauce; canned pears; bread and butter; milk.

DINNER.

Stewed meat with dumplings; baked sweet potatoes; turnip salad; corn bread, light bread and butter; chocolate blanc mange.

The rest of the week shows similar variety. We gather that the matron in charge is not ashamed of the abundant and healthy food supplied at moderate cost.

Taste Replacing Smell

An interesting instance of how one sense may sometimes do the work more generally performed by another is afforded by the rocklings—humble relatives of the cod which abound in tide-pools among the rocks on the British coasts, in two or three species. Conspicuous in life on the backs of these fishes, though hardly visable (*a*) in a small illustration, is a modified dorsal fin consisting of small rays or processes which are almost continuously in rapid vibration. Around the base of these rays is a groove, the border of which is kept clear of dirt or slime. It has been guessed that this vibratile fin, the anterior ray of which is elongated, is some sort of "lure;" but Dr. J. Stuart Thomson now produces strong evidence that its service, together with that of the area about it, is as a food-locating organ. He finds that the skin of the groove is thickly furnished with taste-bulbs, and experiments show that this region is extremely sensitive to the proximity of food. The vibration of the fin keeps the receptive surface clean, and also brings to it currents of water with their subtle indications of food material. The combined arrangement thus acts in the same way as a nose. The probable truth of this explanation of the structure is emphasized by the fact that the rocklings are nocturnal in habit, lurking in dark retreats among the shore-rocks during the day, and going forth at night—when eyesight would not aid them much—in search of their food, which consists of small crustaceans, starfish, mud-worms and the like.

The Farmers' Railroad

A department on "How to Build Things" appears in nearly all farm papers, but it wasn't from one of these that a group of Shelby County, Missouri, farmers and country merchants learned "How to Build a Railroad." They had to reduce the problem to its simplest possible terms, and work it out for themselves.

For many years they had been besieging the Burlington railroad to build a spur from the main line at Shelbina, Mo., to Shelbyville, the inland county seat. The railway officials always answered that the eight miles of track over hilly country would not be a profitable investment.

A group of Shelbyville neighbors finally resolved to build the railway themselves. The editor of the Shelbyville *Herald* began to "pass the hat." Many of the farmers paid in material and labor—with ties and with work on the grades. Still others, embittered by many years of disappointments, signed pledges to contribute whenever the railroad became a reality. They didn't insist, Missouri fashion, upon being shown, but they stipulated that the collector might draw upon their accounts the minute an engine whistled for the last curve before Shelbyville. In cash, nearly $100,000 was contributed at the beginning. The engine whistled into Shelbyville on January 1, 1908.

It was no "model railway" in the matter of roadbed and equipment; and for a while "the Corn Tassel Pilgrim" was much ridiculed. The first rolling stock was two second-hand cars and an engine once used on the New York City elevated lines before the Age of Electricity. This month (its fifth birthday) the Shelby County Farmers' and Business Men's Railroad boasts three locomotives, a little string of freight cars and two passenger coaches; and so great is the community's confidence in the line that an extension northward to the next county is in prospect.

A God with a Rifle

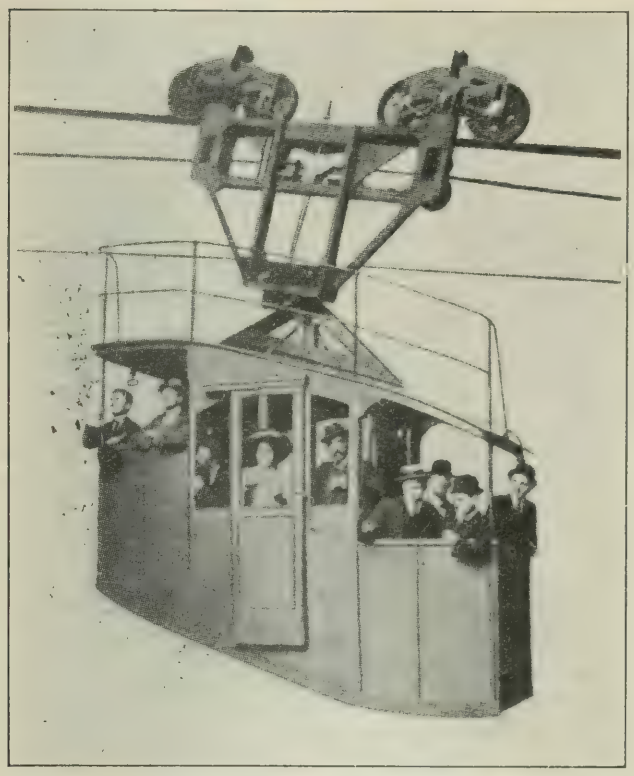
It would be difficult to find in the world a rougher lot than the caravan men of eastern Thibet, who transport loads of tea, packed on yaks, from China into the interior of Thibet and bring out hides, hair, tallow and furs. Whenever one of these men is not a "yak puncher" he is a bandit: in fact he is a robber anyhow. Nevertheless, according to his lights, he is very religious. These wandering Mongols lead a terribly

THE FARMERS' RAILWAY

hard life. Their country is a high plateau, the field of the fiercest winter storms and summer heats, with rough mountains and treacherous morasses for variety. Their only fuel is the droppings of cattle and sheep (argols), which much of the time must be gathered from beneath snow; and their only shelter the great cloak and hood, and the snow that heaps itself over their slumbering forms. They get a little flesh from time to time, but the steady fare is boiled tsamba (parched barley meal and butter) and tea—always tea. Even this poor fare and scanty gear must be guarded with armed and incessant vigilance or it will be torn away by some robber or sneak-thief. What wonder that to this harassed man the gods seem demons and worship becomes a tribute of fear.

When the caravan stops for the night and the yaks have been unloaded and their burdens formed into a protective parapet about the camp, the driver's first thought is for a fire and tea. Only by a skilful use of his rude little bellows can the handful of argols be induced to glow with heat enough to boil a pint or so of water, and inattention or a bad gust of wind may defeat all his efforts. Yet his vital interest in starting his fire and keeping it going does not let the Thibetan carrier forget his devotions. At home he is nominally a Buddhist, or at any rate a Lamaist, but caravan work is another matter—a case of every-day life with which Buddha has nothing to do, but the demons everything. Therefore, as soon as the water is hot, and before he throws in any tea, it behooves a man in this borderland to take a few drops three times from the kettle into his bowl and cast it toward three (not four) points of the horizon, each time reciting a rather long prayer. To whom are these libations addressed? To the formidable deity of the immense, snowy, storm-breeding Anyei Machi range of mountains, where rise the source-springs of the Yellow River. He is an invisible but terribly real magnate to the yak-drivers and carriers who skirt the mountain's base or struggle through its passes. He has under his orders 360 vassals, 1500 officers and an incalculable number of soldiers. No one can stand against this spirit-host; and it is for their aid that men pray when going into battle or danger, and offer daily homage of butter-anointed branches of pine or drops of tea-water. The lamas and their Buddha are all well enough in respect to happiness after death; but for present affairs—safety, good luck in raiding, abundant herds—Anyei Machi is the Master to be consulted with prayer and crackling incense. How real this deity is to the imaginations of these herdsmen-brigands is plain when one hears that he wields no Olympian thunderbolts from his mountain stronghold, nor hurls some gigantic pine-stem as a spear, but goes abroad on horseback, and is armed, forsooth, with a rifle!

The Chinese maps include these uplands within the Empire, and claim government, yet even regular soldiers dare hardly to cross the river from populous and peaceful Sze-Chuan or Kan-Su into the Thibetan wastes, where a great business is done after so barbarous a fashion. One thinks there can be no authority or law over men so wild and merciless; yet when the recent French explorer D'Ollone had once reached the town where resided the chief lama of the region, he recovered after a time every valuable stolen from him on the plains, and received a safe-conduct for the future. But between this politico-religious chief, the rifle-armed deity of the Anyei Machi, and his marauding neighbors, what a life of fear and destruction the Thibetan must live! His only solid comfort is his tea.



ERNEST INGERSOLL.

Fox-hunting Expensive

The cost of sustaining the fox-hunting organizations in Great Britain is illustrated by a late report of the action of the old and famous Buccleugh Hunt. The Duke of Buccleugh declined to continue the hunt next year unless he was guaranteed assistance to the amount of $10,000 annually. Subscriptions hitherto have averaged only about $6,000 a year. In addition to the $10,000 the Duke must probably expend $5,000. All of this money is expended locally, as recompense to farmers for damages to their crops and fences, or to tradesmen for supplies, which accounts for the tolerance of the practice, apart from the popularity of the sport.

An Aerial Trolley

A new means of passenger transportation, which may be described as the dividing line between the terrestrial carriers of the earth and the aerial carriers of the skies, is the aerial cableway now in operation between Lana and Meran in Austrian Tyrol. Hitherto aerial ropeways have been limited to the conveyance of material, especially in mining and excavation work, and this being the first enterprise in the line of carrying passengers on schedule time between three stations on a suspension cable, special permission by the Austrian Government was necessary before the company

AN AERIAL PASSENGER CAR

could begin to operate. The cars are very ingeniously constructed, so that the horizontal position of the seats is not altered in ascending and descending. Each car can seat fourteen people comfortably, and they are worked on the so-called "balanced" principle, ascending and descending cars balancing each other. When two cars are suspended in transit one behind the other, each has its own hauling rope, but the hauling rope of the first car is made to operate as the brake rope of the second, while the hauling rope of the second car acts as the brake rope of the first. These aerial cable cars run on carrying ropes, which are suspended from thirty-nine iron towers planted about two hundred meters apart, and the motive power is furnished by an electric motor driven by a water fall. This new mode of passenger locomotion is proving very popular not only among tourists, but also among the country people of the neighborhood.

Liquefied Gas for Fire-Fighting

It is now possible to extinguish fires by liquified gas. The inventor, a member of the Institute of Marine Engineers, claims that he has found his method highly efficient as applied to confined spaces, such as the hold of a vessel or a factory with the shutters and doors closed. The new system has been tried out successfully in the hold of an English freighter where ten cylinders, each loaded with 40 pounds of liquid carbon dioxide, were found sufficient to deal with a space of 42,000 cubic feet. It is estimated that an outfit of from 40 to 50 cylinders would be required to adequately protect from fire a modern vessel of from 18,000 to 25,000 tons burden, and as the cost of such an outfit would be little more than $1800, or ten cents per ton, its immediate adoption should be made compulsory.

The old practice of blowing steam into the cargo has never worked successfully except to check initial outbreaks, but with this new system properly installed in vessels or in factories the cost of extinguishing conflagrations would be less than $32 per 100,000 cubic feet.

"Apostrophe's"

The genius of the English language is opposed to the annoying little mark called an apostrophe, and refuses to "stand for" it. On every side we see proofs that the apostrophe, little as it is, is too much for us. We cannot master the intricate rules that govern its correct usage. Cannot, or will not; it comes to the same thing.

All over America do you not see such signs as: "Ladie's wraps," "Boys shoes," "Gent's clothing," and "Men's hats"? You may find such horrors even in the shadow of the Hub. You will see these malformed words in our most costly hotels and the most expensive stores. In the Metropolitan Opera House the sign "Gent's" is conspicuous on a public corridor. Many people think the apostrophe is a mark of the plural, and write "Try our new ink's," or "See our gold picture-frames'." It does not seem that the tendency is to abolish the apostrophe, but rather to use it too freely or to misplace it. For instance, it is by no means uncommon to see, not only in private letters, but in newspapers and magazines, such pronoun forms as "it's," "their's," "ours'" and "her's."

If this poor little mark can work such havoc in our English, what should we do if, like the French, we had to master not only the apostrophe, but the grave accent, the acute accent, and the circumflex? We should go as mad as Frenchmen, assuredly! Or, more likely, we should phlegmatically and disgustedly abrogate at one fell sweep all such troublesome dots and fly-specks and thenceforth heroically do without them.

Is this to be the ultimate outcome of our present losing fight with the apostrophe? Shall we follow Bernard Shaw's lead, and boldly (or desperately) write "shant," "wont," "youll" and "Ive," with never a hint of an apostrophe? One hopes, tho, that

we "sha'n't" go so far as to accept Horace Traubel's "He dont," which adds bad grammar to apostrophic license! Would there be any real loss if we simply accepted "Ladies hats" and "Wilsons election" as the linguistically correct thing? In a few cases there might be some confusion, but isn't it better to have no apostrophes at all than to see them stuck in or left out according to the ignorant caprice of sign painters or printers, not to mention those who employ these persons? Shall we allow this impertinent little mark to continue to baffle and shame us? A thousand times, no! Down with the apostrophe! GEORGE JAY SMITH.

Blind Alleys

In the United States more than 6,000,000 boys and girls between 14 and 16 are now employed in industry. To this number the 3,000,000 leaving school at 14 are added annually. In New York City alone more than 25,000 are graduated yearly; 4000 under 16 receive employment. For the most part these children enter industry untrained and unprepared. They know neither their own capabilities and limitations nor the conditions of industry.

The Permanent Census Board of New York City recently made an investigation of 132,000 school children between 14 and 18 who left school to go to work. The partial statistics of these occupations having more than 500 workers are as follows:

Occupations.	*No. Boys*	*No. Girls.*
Housework	2	18,276
Errand boys and girls	12,529	1222
Clerks	9145	2986
Office boys and girls	7993	1776

Most significant is the fact that the more than 50 per cent of boys and girls between 14 and 18 are working at "blind alley" occupations, that is, occupations which the child enters by accident and haphazard. To him they promise a fair initial wage. They require no skill. They teach no initiative and offer no incentive for ambition or merit. Few who enter them rise to skilled trades. Frequently the work is temporary or seasonal. The children drift from one low grade occupation to one requiring still less ability. By reason of the competition of fresh and cheaper labor the older children are pushed out by the army of new recruits. Gradually they are compelled to join another more menacing army, that of the unemployed and unemployable. For them there is only one solution; namely, adequate industrial and trade training for the child who must leave school for work and organized guidance to find out the ability and character of every child. To further his ambitions and to develop his social efficiency is the province of the selected occupation. Who can estimate the cost of this ever increasing number of misfits, for the child, for industry, and for the nation?

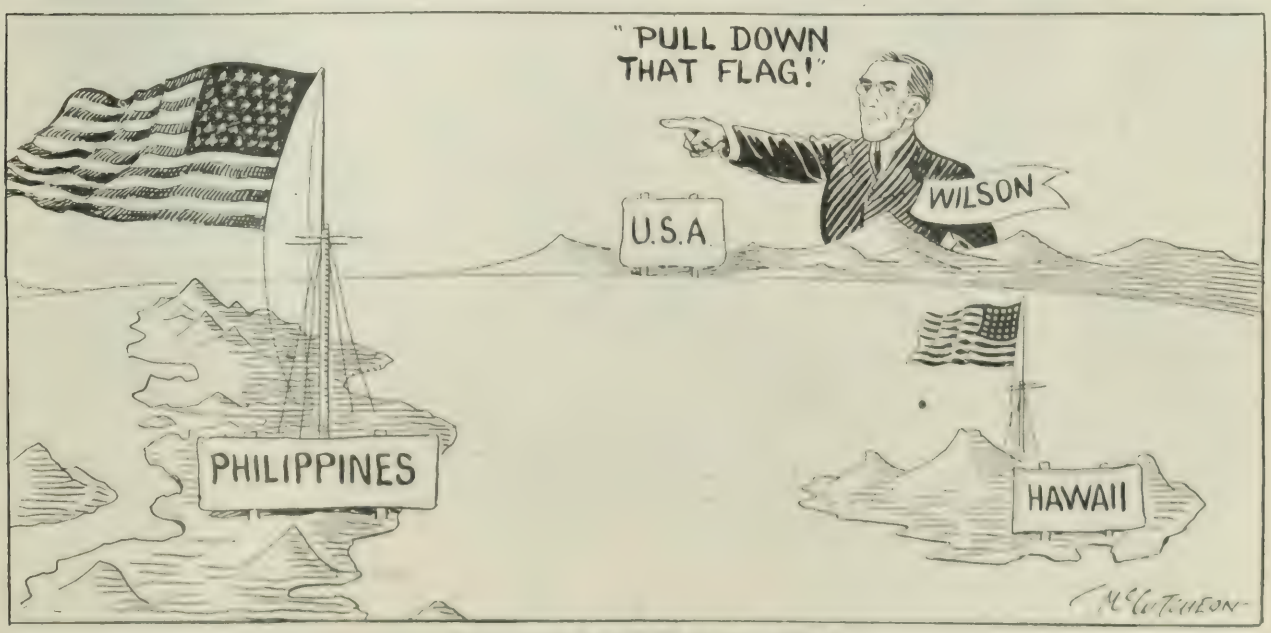
Little Ikey came up to his father with a very solemn face. "Is it true, father," he asked, "that marriage is a failure?"

His father surveyed him thoughtfully for a moment. "Well, Ikey," he finally replied, "if you get a rich wife, it's almost as good as a failure."



THE PLEA OF THE SPELLING REFORMER

When Shaykespeare wrote and Raleigh sayled
In goode Queene Bess her daye,
As dyverse bookes and letteres showe
They used to spelle this waye.
They did not gruddge the tyme it tooke
For thenne you understande
They did not have to catche the mayle,
Their missives went by hand.
Our great-grandsires let letters drop;
Our grandsires dropped out more.
Why should we let the good work stop
Begun in days of yore?
There's precedent for what we do
If we drop letters, too;
E'en if thorough—by time we're through,
Becomes T-h-r-u. MAUD GOING.

THE MANUFACTURER TO THE MIDDLEMAN: "Why, next thing you know, those consumers will be asking fair prices!"

Advertising Affirmations—III

By George French

Does advertising increase the cost of living? Certainly not. It decreases the cost of living.

Does the consumer pay for the advertising of the goods he buys? Surely he does. The consumer pays for everything is paid for.

Do you see how easily these two perplexing questions are disposed of? But they are not disposed of so easily. They are answered, but questions may be wrongly answered. Are these?

I am sure that all students of economics will agree that I have rightly answered the second question, tho I may have virtually begged it. The consumer pays all bills, but the question as to who pays the advertising bills is not quite so fundamental; and it is not of so much consequence who pays bills as that whoever does pay gets the proper economic *quid pro quo*. I am perfectly willing to pay for the advertising of any necessity or luxury if thereby I get that necessity or luxury for a less gross price than I could had it not been advertised.

These two questions are aimed at the same economic condition, and may be merged into: Does advertising increase the cost of goods beyond the worth of the benefit flowing from increased production and economic handling and distribution? If only legitimate advertising of legitimate goods is considered, it can be said with confidence that advertising does not impose upon buyers extra cost of living.

All illegitimate advertising creates loss, as does illegitimate business of any kind. Advertising is used to cheat and defraud. That is the lamentable condition that has done much to discredit advertising. We can only console ourselves with the fact that there is each year less fraudulent advertising than the year before, and that all good advertising men hope that some time and somehow deceptive advertising, and advertising to sell fraudulent goods, will be made impossible. It is not fair to charge all advertising with the sins committed in its name, nor with the sins committed through its forms.

Legitimate and skillful advertising, applied to the selling of staple goods, permissible luxuries, or to methods for the amelioration of life through the promotion of rational and innocent pleasures, does not increase the cost of living. It lessens the cost of living, as anyone "with half an eye" can see. Take Truman DeWeese's wheat biscuit, for an example. They are either a necessity or a permissible luxury in many thousands of homes. They are made and sold for 10 cents a carton. If they were not made by the million they would cost much more than they do. If it were not for advertising they would probably not be made. What non-advertised article of food could economically replace them?

It is perfectly safe to claim that any successfully advertised article, not patented, is supplied to buyers at less cost than the need can be satisfied with non-advertised articles. In other words, it is easy to show that advertising is an agent for economy in living, if its advantages are utilized with a view to promote economy. Many things are offered through advertising which, if purchased, contribute to the high cost of living; but it is not fair to charge advertising with the consequences of indiscreet or extravagant purchasing.

If the indictment against advertising were to suggest that it leads buyers into temptation, we would at once have to plead *nolo*. That is what we claim for advertising. It allures. It tempts. It cajoles. It persuades. That is its purpose, and its only license for being. It is very like all mercantile devices calculated to promote sales. It is a good servant but a hard master.

I am not a believer in *caveat emptor*, but I do believe that it is not necessary that any of us should yield to the blandishments of advertising to our financial detriment. On the other hand, if we carefully discriminate we can make advertising serve us so well that we can add a substantial sum to our savings every year, instead of having falsely to accuse it of being in league with the other economic causes that are raising the cost of living.

And what a dry and uninteresting commercial world this would be without advertising, and how devoid of enterprise and profit!

In the Realm of Insurance

By W. E. Underwood

Figures of the Postal Life

An examination of the management and financial condition of the Postal Life Insurance Company of New York, by Chief Examiner Nelson B. Hadley of the New York Insurance Department, covering a period down to June 30, 1912, was concluded December 12 last and made public about ten days since. The report is voluminous, complicated as to phraseology and arrangement, and not easily comprehensible by the citizen unfamiliar with life insurance terminology and accountancy. The nature of the case demanded for its successful exposition simplicity of statement and system. The company as now constituted is composed of the business it acquired by itself and that which it absorbed in its reinsurance of the business of the Economic Life, the Mutual Reserve Fund Life and the Provident Savings Life. Hence, the absolute necessity for clearness.

The notable feature of the Postal Life, and one that differentiates it from all other American companies, is that it employs no agents to procure business and makes all of its solicitations to the public through the newspaper and magazine press, negotiating directly with prospective insurants through the mails. We are informed by the Examiner's report that it is impracticable at this early stage in the history of the company to arrive at the ultimate cost of getting business in this way. During the year 1911, the advertising expense was $25,661; the new premium income, $26,578. For the first six months of 1912, the outgo for advertising was $18,492; the new premiums secured, $48,872. Add to the expense for advertising, $1,128 unpaid bills on that account and $6,500 for medical examinations, and the total cost seems to be $26,120, or about 54 per cent of the premiums.

During the period, running from January 1, 1911, to June 30, 1912, first year's premiums on original policies aggregated $98,829, while guaranteed dividends, $14,771, and surrender values, $3,283, brought the total first year's premiums to $116,883. The total premium income was $2,932,033 and the total income, $3,878,383.

The principal disbursements were: net amount paid for losses and matured endowments, $2,085,102; surrender values in cash, or applied in various ways, $1,359,153; dividends to policyholders in cash or otherwise, $36,378; (total to policyholders, $3,505,975); total disbursements, $4,452,490.

The total admitted assets are placed (June 30, 1912) at $10,256,385, the principal items being: real estate, $3,594,000; mortgage loans on real estate, $1,421,500; loans to policyholders, $2,853,016; premium notes, $267,788; book value of bonds and stocks, $1,502,576; cash, $106,555; deferred premiums, $193,501.

Among the liabilities the chief item, of course, is the net reserve on the outstanding policies, which was valued at $9,608,914. There were $192,747 outstanding policy claims, and the remainder of the liabilites consist of a number of comparatively small items. The net surplus was $126,875, which, with the capital of $100,000, gave a policyholders' surplus of $226,875. In our opinion, the margin of surplus is rather narrow and should be enlarged. In the Insurance Superintendent's memorandum we are informed that the company claims there has been an increase in surplus between June 30 and December 1 of $40,068.

In conclusion we quote the memorandum of the Superintendent in its entirety:

The examination of the Postal Life Insurance Company has extended over a several months' period of time, and it was found desirable, after part of the work was completed, that the examination should be brought up to June 30, so as to get the results of the combined company for as long a time as was feasible. The examination has shown that the method of writing insurance by mail brings the policyholder in communication with the home office of the company. The company is free from litigation arising from questions with its own postal policyholders. The litigation it has now in hand is practically all taken over from the Provident Savings. There is merit in the health work of the medical department, not only to the company and its policyholders, but to the general public as well. Notwithstanding unusual expenses in 1912 for betterment, the company has sustained no actual loss in surplus since its last annual statement, other than that created by the change in the method of reserves and accounting, and the elimination of certain items which were reported as admitted assets in such statement. Applying the same method of reserves and accounting to the two companies, as of the date of the reinsurance, as is applied now, gains have been made. It is claimed by the company that

there has been an increase in surplus since June 30, 1912, and up to December 1, 1912, of $40,068.22.

The report shows that there has been a general improvement in the condition of the company and a number of improvements in the handling of the business and the treatment of the various questions which arise out of the large amount of reinsured business, such as occurs in this company. The taking over of the business of the Provident Savings Life Assurance Society by a company much smaller and the working out of its problems was a difficult one. The real estate problem has been and is the most important one for the management. The organization of a corporation to take all the real estate, except the home office building, which the law allows it to continue to hold, under which arrangement $80,000 of cash is put into the company, I trust is the beginning of the end of this company's real estate problem.

Is There an Arson Trust?

Sensationalism has secured another insurance subject around which it is taking a turn in hysterics. Unintentionally, perhaps, but none the less effectively, a grave public officer has given the cue for the exercises, and the newspapers which delight in that sort of thing are enjoying themselves. Fire Commissioner Johnson has committed himself to the absurdity that twenty-five per cent of the fires in New York City are of incendiary origin; that there is in existence what is called an "arson trust"; and that these criminal conditions are partly due to the failure of fire insurance companies, in their eagerness for premiums, to properly inspect the risks offered them.

Of course, if there is an "arson trust," which, through collusion with unfaithful and dishonest brokers, solicitors and adjusters, succeeds in burning up and getting paid for property alleged to be worth $4,000,000, then there is also something radically deficient in the criminal branch of the city government. That there are, among the 10,000 brokers who solicit patronage from the public for the fire insurance end of their business, a certain percentage of dishonest men, is to be expected; and it doesn't strengthen the charge made by the Commissioner to admit that, occasionally, some company adjuster, either through neglect or collusion, aids them in swindling a company now and then.

To argue that a company should, through one of its own direct representatives, inspect the intimate physical hazards and appraise the value of every lot of household property on which application is made for protection, is to admit a lack of knowledge on the subject; because the impracticability of such a procedure, from the expense side of the matter, is obvious. It would cost more for the inspection than for the insurance. Although companies are occasionally deceived by both brokers and assured, and are sometimes victimized as the result, there is not a reason for concluding that no broker and no insured person is to be trusted. Instead of putting the expense of universal inspection before issuing policies on the insured—and there is no one else upon whom any expense can be put—the companies prefer, and with sound business reason for the preference, to defeat any attempted dishonesty after the loss occurs and when the adjustment is undertaken. The number of insured risks is very large; the number which get to the stage of losses, comparatively insignificant. In conclusion, it is unreasonable to impeach either the integrity or the business acumen of the men who direct our fire insurance companies.

The New York Life

Following its usual custom since the law of 1906 was amended enlarging the activities of life companies in the matter of new business, the New York Life Insurance Company during 1912 wrote the full legal limit, which in that case was $198,381,400. The company ended the year with $2,169,798,993 insurance in force; $719,657,050 of assets at market values; policy reserves of $611,407,979; and reserves for dividends and contingencies of $108,249,071. The directors have apportioned for distribution among policyholders during 1913, the sum of $15,364,714 as dividends, an increase in that item of $3,674,571 over the amount awarded in 1912.

Under the provisions of the New York law governing the amount of business a life insurance company may write in any one year, the company this year will be permitted to accept about 222 millions, which quota it will probably fill up within the first nine months. In recent years this has been the approximate experience and it is notable as one untoward effect of the law that during the months of October, November and December, 1912, it was obliged to send out policies deliverable in 1913. About 80,000 new members were added to the company last year, and there might easily have been many more on the same economical terms but for the limit set by an unwise statute.

This Department is at the service of readers of THE INDEPENDENT *on all subjects relating to Insurance. Do not hesitate to ask for information or advice.*

Financial

The Steel Trade

In 1912 the iron furnaces and steel mills broke three records. The product of pig iron exceeded that of any preceding year by more than 2,000,000 tons, and there were large increases of the outputs of crude steel and rolled steel. It is now known that the steel rail orders during the year exceeded 5,000,000 tons, 600,000 having been added in December. The *Iron Age* says:

> No year has ever opened for the American iron trade with any approach to the high pressure conditions existing today. Confidence is strong that 1913 will exceed 1912 in consumption of iron and steel. An astonishing fact is that manufacturers are hurrying work on more than 3,000,000 tons a year of new open hearth capacity, whereas when 1912 opened the belief was widespread that the country's steel-making capacity was more than 6,000,000 tons in excess of the year's probable requirements.

The United States Steel Corporation is about to make a new plant in Canada, at a cost of about $20,000,000. There will be blast furnaces and mills for rails, wire, bars, and structural shapes. The site is at Sandwich, Ontario, near Detroit, where the company owns 1500 acres of land, including more than a mile of water front where the Detroit River is from 25 to 30 feet deep. Altho Canada's tariff averages about $7 a ton, our steel manufacturers have made large sales in that country.

Leading mills are now sold ahead well into the third quarter of the year. Similar conditions are reported in England, where the Staffordshire producers of pig iron in December increased prices for the fourth time in twelve months. Mills are working there at capacity, and the demand is urgent.

The Cotton Corner Decision

The decision of the Supreme Court, last week, in what is known as the Cotton Corner case, must be regarded as one of exceptional importance. James A. Patten, of Chicago, with three associates from the South, were indicted under the Sherman act for cornering cotton in 1910. Estimates of their profits ranged from $10,000,000 to $30,000,000. Mainly as a result of their operations, the price of cotton was considerably increased. Demurrers to vital counts of the indictments were sustained by the Circuit Court, whose judgment has now been reversed by the court of last resort. The merits of the case are not considered, of course; there is no opinion as to the guilt or innocence of the defendants, but it is held that the offence charged is one forbidden by the Sherman act, and, if their acts were those alleged in the indictments, they were engaged in a criminal conspiracy. Upon those indictments they must go to trial.

By this decision the scope of the Sherman act is broadly extended. Those who corner wheat or corn or copper may be prosecuted under the criminal provisions of the statute. Their operations in the market may be checked by injunction. Attorney General Wickersham goes too far when he says that by means of the decision "the problem of the high cost of living can be solved," for that cost has not been greatly affected by corners, the effect of which upon prices has been temporary. But it is well that there is a Federal statute under which cornerers may be restrained and punished. Cornering will be discouraged and made perilous by the decision, and the interests of the consuming public will thus be served. The words of the court suggest that it may be practicable to use the statute with respect to market operations which are not called corners, but which resemble them in their effect upon supply and prices. The court said:

> It may well be that running a corner tends for a time to stimulate competition, but this does not prevent it from being a forbidden restraint, for it also operates to thwart the usual operation of the laws of supply and demand, to withdraw the commodity from the normal current of trade, to enhance the prices artificially, to hamper users and consumers in satisfying their needs, and to produce practically the same evils as does the suppression of competition.

It may hereafter appear that certain practices in the food market, not associated with operations in Exchanges, are forbidden by the Sherman act.

The Cost of Living

The index number of *Bradstreet's* for Jan. 1, based upon the wholesale prices of 106 representative commodities, carefully selected, is 9.5050, showing a slight decline from the average on Dec. 1, which was 9.5462. This January average, however, is higher than that of any month in 1912, December excepted, and the increase since Jan 1, 1912, is 6¼ per cent. It is also higher (December, 1912, excepted) than the average for any other month in the last ten years. Comparison shows an increase of 24 per cent. since Jan. 1, 1902, and an advance of 23⅞ per cent. since the middle of 1908.

The Independent
A Weekly Magazine
Founded in 1848

VOLUME 74 NUMBER 3347

The Divided Republican Party

At the recent national election 6,303,063 votes were cast for Mr. Wilson, who is to be President, altho this number is less by 100,000 than the number of votes given to Mr. Bryan in 1908. For the nominees of the two opposing factions 7,608,093 votes were counted. These factions represented the old Republican party. It is true that in some parts of the country Democrats were drawn to the Roosevelt ticket. It is also true, however, that many Taft Republicans voted for Wilson. We know that at the preliminary election in Vermont, where the Roosevelt ticket had 37 per cent. of the anti-Democratic vote, there was a Democratic gain of 4,000. Some allowance must be made for the changes that, in November, increased the Socialist vote (from 420,000 in 1908) to 927,000. On the whole, it is fair to say that the two factions that opposed Mr. Wilson were, substantially, the old Republican party. Can they be united?

The effect of the division was not only the election of Mr. Wilson but also the election of a great Democratic majority in Congress. It is proposed now by the Roosevelt party's committee that this majority shall be preserved at the election in 1914, for Roosevelt or Progressive nominations are to be made in every Congressional district, and, if possible, in every county.

One of the most earnest and generous supporters of the Roosevelt ticket was Frank A. Munsey, who suggested a few days ago in his newspapers a plan for a kind of reunion or amalgamation of the severed parts. There could be no alliance, he said; neither faction would go over to the other, but both might be taken over by a political holding company. At present, he pointed out, they were two hopeless minorities. He would have a national conference, each faction sending to it the same number of delegates, for a careful consideration of principles or a platform which both could support. The differences in the two existing platforms did not seem to him to be insuperable. There was now almost an agreement upon leading economic questions, and he believed that two-thirds of the Republican faction were in sympathy with Progressive policies. The new organization might be called the Liberal party. Some regarded this proposition with hopeful interest, thinking that it indicated the attitude of many who had voted for the Roosevelt ticket. Still, the recent action of the Progressives had given no warrant for such a belief. In the New Hampshire Legislature, for example, by a coalition with the Democrats they had gained a Speakership by electing a Democratic Governor, thus widening the factional breach.

Mr. Roosevelt promptly and emphatically said No. In a long statement he declared that it was folly to talk of union. He sharply attacked the

Republicans, whose managers, he said, showed a continuing purpose to cheat at primaries and conventions. This statement was full of bitterness. Those in his party who were beginning to speak favorably of Mr. Munsey's project suffered a chill and were silent.

We feel like commending the attitude of Mr. Munsey. The leader of his party appears to expect that the party will grow until it becomes a majority. At present such growth cannot be foreseen. The votes needed to make a majority will not be drawn from the ranks of the Taft Republicans, nor is there any prospect that they will come from the Democratic party. Mr. Wilson is in sympathy with the progressive element in that party. He has given notice that Progressives are to be chosen for his Cabinet. If his course and the course in Congress of the majority in sympathy with him shall alienate any considerable number of Democrats, they will be Democrats whom the Roosevelt leaders cannot hope to attract. The purposes of the leaders of the two factions, as well as the indications of Democratic policy, point to a perpetuation of what Mr. Munsey calls the two hopeless minorities.

Mr. Taft is not more conciliatory than Mr. Roosevelt. In a public address two or three weeks ago he said that in spite of recorded defeat "we were victorious in saving our country from an administration whose policy involved the sapping of the foundation of democratic, constitutional, representative government, whose appeals to the people were calculated to arouse class hatred that has hitherto been the ruin of popular government, and whose contempt for the limitations of constitutional law and the guarantees of civil liberty promised chaos and anarchy in a country that has until this time been the model of individual freedom and effective popular government." Reconciliation is not promoted by the attitude of either of the defeated nominees. But Mr. Roosevelt will continue to be the head of his political organization, while Mr. Taft may cease to be active in politics.

A large majority of the followers of Mr. Roosevelt very earnestly desire to see the principles of their platform embodied in legislation. But neither the Roosevelt party nor the Taft party can accomplish anything in their present condition. The two factions could not agree as to all that is to be found in their long platforms, but it seems to us that by mutual concessions and modifications agreement as to a considerable part of the platform utterances could be reached. After such an agreement there would be votes enough to make statutes and to elect executives to enforce them. It is better to have a majority that can give statutory force to principles than to be a hopeless minority, awaiting the action of a party in political opposition. And half a loaf is better than no bread, if the half loaf is sorely needed for the general welfare, and if there be a prospect that one half would eventually be followed by the other. If the division be prolonged, each of the hopeless minority factions must be satisfied with such slices of bread as the Democratic party will give. We hope that the bread will be good and that the slices will be thick. For another reason we should be glad to see a reconciliation of the factions. There is need of a compact and potent Opposition, whether the ruling party be Democratic or Republican.

But so long as Mr. Roosevelt stands at the head of the Progressive party and directs its action, a reconciliation, we suppose, cannot be expected. Mr. Taft's leadership is not so great an obstacle. The rank and file of both factions should consider carefully such propositions as this one made by Mr. Munsey. If they could induce both Mr. Roosevelt and Mr. Taft to withdraw, and to take with them a few of the bosses prominent in each faction, and if they should then seek to reach an agreement in a national conference, they might well serve the public interest.

The Most Useful Men

Somebody the other day bethought him it was time to know who are the most useful men and women now extant in these United States; and he conceived that the way to find out was to take a vote. So he sent out his little questionnaire, and got a lot of answers.

It appears that, as by this method determined, the most useful American among us is Col. Theodore Roosevelt, and a close second is Miss Jane Addams, who enjoys the distinction of being the first woman who ever nominated a presidential candidate in a national political convention. Other preëminently useful persons it seems, are certain financiers and a great inventor or two.

Far be it from us to question the social value of these exalted individuals; but may we remark that a popular verdict on such a question decides primarily who are the best known and most talked about among useful persons. Incidentally it may fix upon the individuals that really are most useful—but this does not necessarily happen.

There is some reason to believe that the most useful persons of any generation are not usually well known in their own lifetime. We suspect that Galileo's name might not have appeared in any list of the useful twelve in 1613. How many Englishmen in the enlightened nineteenth century would have put Sir William Jenner in their round dozen? And how many Americans, Englishmen and Scotchmen even now, in the twentieth century, know who discovered anaesthesia?

We are moved to these reflections by the remarkable unanimity with which the voters in the election now under consideration have forgotten, or for some other reason have failed to bring forward certain names that are not daily featured in the headlines. We will make a guess that Dr. Simon Flexner in preventive medicine and the Mayo brothers in surgery, will hold a place in the world's memory of its great utilitarians after some of the present day favorites have dropped out of the biographical dictionaries.

And how about the honorable justices of the Supreme Court of the United States? They have not escaped publicity, to be sure, and there are progressive minds here and there, that would not put them in the ranks of the useful. Yet we will make our little guess about them also. It is that when some sober-minded historian of the twenty-fifth century tells the story of the rise and establishment of social justice in the United States, he will find occasion to review the recent decisions of this same Supreme Court, and to pay a rather interesting tribute to its utilitarian wisdom.

What Is the Test?

We are constantly seeing and hearing most doleful tales of the loss of the religious spirit. People do not believe as much as they did, which is true; they do not crowd the churches; country houses of worship are deserted; candidates for the ministry are declining; family worship is a lost custom; Sunday is desecrated; the automobile does not take the families to church, but away from it, and many other evidences of decadence. We do not believe it all, and we ask what are the true tests of the prevalence of the Christian spirit? One such test is the work and money which the people give for the spread of the Christian faith. Leaving out for the present what is done for the maintenance and extension of the Church at home, let us take the facts in reference to foreign missions, for a better test can scarcely be found. The *Missionary Review* has just issued its annual table of statistics of Protestant missions for the world. The amount contributed last year was $30,404,401, over $5,000,000 more than the figures showed for the previous year. The number of missionaries in the field was 24,092, against 22,058 for 1911.

Taking the United States alone we

find that it leads the world in Protestant missions. The gifts for it were $14,942,523, and the number of missionaries employed in the foreign field, men and women, was 8037. We do not say that more might not well be done; nor do we deny that more was spent last year for beer or automobiles or dreadnoughts, nor do we question that more people have bought automobiles the past year than the total number of Americans in the foreign mission field, but we do claim that the support given to mission work far from our own country is a good test of the interest taken by our people in Christianity, and its results need discourage nobody.

Is It Crime as Well as Sin?

Why should the civilized world continue to accept as a necessary evil the sexual passion and declare it to be a necessity to provide someone's daughter or wife to gratify the desires of men who claim they cannot control their physical passions?

If a man steals my purse or forges my name on a note, the law says he is a criminal and should be arrested and locked up. The law says he must not be allowed to exercise his passion to steal and forge other people's names.

But if a man refuses to curb his physical passion, even if the exercise of it debauches women or creates diseased children, even if they be his own, the law does not restrain him.

Yet is it not true that the man who steals my purse or forges my name does infinitely less harm to society than the man who is physically impure? For centuries Europe and America have recognized the social evil as a *necessary* evil, and have said it could not be cured. Is it not time for civilization to say to men who do not curb their physical passions, "You must be locked up until you learn to behave?" Have we not a right to protect society from lust as we try to protect it from theft?

Are the prostitute and all the shame and wrong of centuries connected with her *necessary?* Ought we not to turn to the *man* in the case and deal with him as we deal with any criminal? Is it not a *crime* for a man to fail to restrain his physical passions, as well as a *sin?*

This subject can be treated with reserve, but cannot any longer be suppressed. Women must take it in hand as well as men, and are doing so. A new ten million dollar fund is to fight this evil. Ex-President Eliot, who is not an alarmist, says in a late address:

> We have got to remove this evil, or this country will not be ruled by the race that is now here. The family life of the white race is at stake in its purity, healthfulness and fertility.
>
> We have tried the policy of silence and the policy of segregation, but there is no cure except the observance by men of the same standards that almost all races demand of their women.

The Jews in Palestine

In an interesting letter to the London *Times* Max Nordau expresses the hope that, when the powers are settling up matters for Turkey and the Balkans, they will not forget the Jews. But the Jews have nothing to fear in the Balkans, for Servia and Bulgaria and Greece do not treat Jews brutally as Rumania treats the quarter million of her native Jews. And Turkey has not been as cruel to Jews as she has been to Christians. She does not feel that she has any such religious conflict with them as she has with Christians. The Jews believe in one God, not in the man Jesus whom the Christians hold to be God.

But it is not the Jews of European Turkey, but of Asiatic Turkey, for whom Mr. Nordau would plead; nor is it for the resident Jews, but for the immigrant Jews of Palestine. There are nearly 100,000 there, about a seventh of the population, who are Zionist colonists. They do not wish, he says, to establish a separate nation, but are contented to be under Turkish rule. At present their immigration is impeded. To all for-

eign Jews entering Palestine only the "red passport" is given, which requires them to leave the country within six months, while any other foreigner can remain indefinitely. Jews may not acquire land in Palestine, while others may do so. These unfair discriminations indicate a fear that if Jews are allowed to settle freely in Palestine they will overrun the country and seek independence. There is abundance of agricultural land, and it is not strange that this fear exists. Yet if Jews should finally predominate there is no question that it would be for the benefit of Palestine, and there is no reason why it should not remain within the Ottoman empire as a self-governing state, free and yet loyal. There is nothing like repression to make a state disloyal.

Surgery and Morals

Every now and then there comes a sensational announcement in the newspapers that some convict with criminal tendencies or some degenerate with unfortunate habits, cravings and tendencies has been cured by a surgical operation on the skull and brain. There is usually a story of the patient having been injured in early life and then having developed during the adolescent period the criminality or unfortunate tendency which has finally got him into the hands of the law. He is announced as cured by the operation and the public is invited to admire how much is accomplisht by these modern developments of surgery. Only rarely do the subsequent developments in the case get into the newspapers so sensationally as the other day when a man "cured" of criminal instinct by surgery in prison, was pardoned because of the great change in character that came over him, but now has been arrested for a series of burglaries. Not only was he one of the burglars, but other members of the gang insist that he was the active leader. He had a long record of convictions for forgery and thefts on his conviction four years ago and evidently his scheme of sending for his family physician and telling him the story of an injury in childhood and that he believed that this was the reason why he stole so persistently, even many things that he had no need for, was only a portion of a well laid scheme for freedom, which worked beautifully, for after his recovery from the operation Governor White pardoned him because his circumspect conduct and change of disposition seemed to show that beneficent surgery had cured him of his criminal tendencies.

The operation consisted in the lifting of a deprest portion of bone. Sometimes there is no such striking external evidence of the early injury as an actual depression in the skull, though there is the story of the injury and at operation a thickening of the bone, or a hardening of it, or an adhesion between the membranes of the brain and the skull may be found, or the dura, the outer membrane of the brain, may be found thickened and roughened and therefore capable of producing irritation upon the sensitive brain tissue. A few years ago operations on such injuries were done for epilepsy and in many cases they seemed to relieve the patient and sometimes the relief was so striking that even there seemed to be a cure. Operations on the skull for epilepsy are however done much more rarely than they used to be some twenty years ago, and physicians and surgeons hesitate to recommend such an operation unless in exceptional conditions and when serious developments are feared. After its completion when there seems strong indication for it they are quite hesitant about proclaiming a "cure" until a considerable period has passed, for in practically all of these cases relapses take place. The immediate improvement is apparently due oftener to the strong suggestive influence of an operation, that is, the profound effect produced upon the mind by the surgical intervention and the preparations for it and subsequent weeks of convalescence than

by any favorable physical effect on the brain.

Certain forms of impulsive crime, even murders, but particularly tendencies to arson, or the injury of others or sex crimes, may be connected with epilepsy. Indeed, these criminal tendencies are sometimes spoken of as epileptic equivalents, that is as representing in the moral order what the epileptic attack is in the physical constitution of the individual. Occasionally just before or after an epileptic attack these criminal impulses are most noteworthy. Sometimes they seem to take the place of the epileptic attack; that is, about the time that ordinarily a convulsion would take place, a curious irrational state of mind develops with impulsive tendencies which work themselves out in the performance of crime. It might be expected that such impulsive criminals would be benefited by operations occasionally, but the experience with epilepsy in simpler forms, and particularly such epilepsies as are connected directly with injuries, is not encouraging enough to make physicians place much dependence on this form of treatment. Only very rarely can improvement be hoped for, and even in those cases it is not quite determined whether the strong mental influences may not mean more than even the deep physical effect.

Twenty years ago the great French surgeon Lannelongue operated on the heads of idiot children with very small skulls. His underlying idea was that the skulls of these children hardened before the proper time and thus confined the brain and kept it from developing to maturity. The first patient operated on by him was greatly improved. It looked as though a great new field for operative surgery was opening up and that most of our idiots would by this means be made capable of proper intellectual development. Of the next score of infants operated on not one was improved to the slightest extent. He happened in the first operation to hit on one of these very rare cases in which premature ossification of the skull does prevent brain development, but the vast majority of microlphalic idiots have small heads because their brain did not develop sufficiently to make the skull of larger size and it is lack of brain development and not its prevention that has made them unintellectual beings.

A great many operations have been done with the hope of correcting mental and moral peculiarities, but the results have not been at all encouraging for further evolution of this form of brain surgery. Moral and intellectual defects occur in individuals, in whom so far as can be determined after a most careful autopsy, there are no special qualities or defects in the brain that differentiate it from those of normal individuals. After all it must not be forgotten that the worst kinds of mania and the deepest forms of melancholia may be followed within a comparatively brief time by complete restoration to mental health. Fever may produce a delirium in a perfectly healthy individual in the midst of which insane delusions, hallucinations, and irrationalities of all kinds may occur. Persons who die in the midst of a maniacal attack do not present any special characteristics of brain tissue, and when they die accidentally in deep melancholia as sometimes happens because of their suicidal tendencies physicians have come not to look for any particular findings in their brains. Hence apparently it would be idle to look for improvement in criminal tendencies by localized operations upon the brain, for it is functional and not organic disturbances that are at the root of these unfortunate conditions so far as anything physical is responsible for them.

There has always been a tendency for men to blame their yielding to evil tendencies on something for which they were not responsible. In the older times they blamed the stars and made guilty of their disasters in Shakespeare's phrase the sun, the moon and the stars "as if we were

villains by necessity, fools by heavenly compulsion, knaves, thieves and treachers by spherical predominance; drunkards, liars and adulterers by an enforced obedience of planetary influence." Later on it came to be heredity that was made the scapegoat for men's sins; apparently to be just in our punishments we should have punished the grandfathers of our criminals. In still more recent years various injuries to the brain have been blamed for tendencies to evil. Occassionally sensational announcements are made of cures. Like the cures for epilepsy, however, physicians who have followed these cases do not place very much confidence in them. It is very rare that an injury to the head is followed by moral obliquity, though we have records of many head injuries. In the few cases where it does follow, physicians are inclined to think that it is a question of *post hoc* not *propter hoc*. Men with evil tendencies are quite willing as a rule to blame the injury rather than themselves, but that is an old story. The late completed case is a fine commentary on the whole situation.

A New President of France

France has done well to choose Raymond Poincaré, who has headed a distinguished ministry, for her chief titular executive during seven years. The choice was made, to be sure, in the face of one Deputy's protest that the people, and not an Assembly of Deputies and Senators of three years' standing, should make the choice; but that Deputy happens to be an aristocrat and a reactionary. Besides, the indirect election of Presidents may be said to have safeguarded the republican government. Louis Napoleon was elected President of the Second Republic by popular vote in 1848; within three years he had the people's approval of his *coup d'état* by an overwhelming plebiscite.

The election of M. Poincaré on Jan. 15 was not unexpected, but latterly the contest was confused by rumors of an imperial conspiracy, by the revival of the Dreyfus case in the reëmergence of Colonel Paty du Clam, and by ex-Premier Clemenceau's bitter opposition to the successful candidate. All this makes the result the more welcome. The new President, who is a moderate Republican, is only fifty-two years of age, and will take office with all the prestige of a popular first minister, and of a lawyer eminent alike for character, eloquence, learning, and industry. He is a man of infinitely greater force and distinction than the outgoing President, amiable Armand Fallières, or the preceding incumbents, Emile Loubet and Felix Faure. France has, in recent years, honored men of little stature, hoping to escape thereby the ever-present danger of a Man on Horseback overriding the Republic. She has tired, however, of pettiness—a pettiness scarcely respectable in at least one case. And, since the Third Republic has weathered forty years, Frenchmen have come to the conclusion that the danger of a too ambitious chieftain in the Elysée Palace is less grave than the danger of France lacking a strong central government at a moment of ministerial crisis—such as has coincided, once at least, with an international one.

Tho the jealousies of the more notable leaders, the disadvantages of a group system, and the dread of a tyrant have all checkmated legitimate aspiration, there has for some years been a growing dissatisfaction with the traditional system. It is said that the mysterious resignation of Casimir-Perier in 1895 was due to his discovery of the fact (duly set down in all text-books) that while the English King reigns, but does not govern, and the American President governs, but does not reign, the French executive neither reigns nor governs. Of late publicists have taken to reminding citizens that the French President is, constitutionally, commander of the army and navy, that he signs all treaties, that he presents all the projects of gov-

ernmental laws, that he names the ministers and presides over their councils. Until he visited Paris and delivered a commonplace lecture before an extraordinary audience, at the Sorbonne, Mr. Roosevelt was immensely popular in France; and this was because his personality incarnated, for the Gallic imagination, at once the humanitarian and the imperial idea; because, in short, he exercised firmly, yet, in the main, beneficently, the powers conferred upon him by the Constitution. "Here is a President of a Republic," exclaimed Jules Lemaître, "who thinks for himself and who speaks out his thought. This thought is clear and high, generous and bold. He expresses it in a form that is his own. He makes no use of the flaccid, hypocritical formulas of our own official harangues. He speaks like a man."

This was some years ago, but it is only a few weeks since the Socialist leader, Jean Jaurès, declared that France needs, in the presidency, "repsentation by a man who can speak in her name with some authority. Continuous and fundamental mediocrity is not without its peril." In electing Poincaré France chooses a statesman who has already "spoken in her name with some authority" in the Balkan negotiations; and one whom we believe to entertain no quarrelsome policy or extraconstitutional ambitions. *Le Temps* declared, some time ago, that there was "not a Senator or Deputy who will not recognize that M. Poincaré, by the *ensemble* of his public and private qualities, would make a Chief of State truly worthy of France."

The new President's personality is not, however, the only point to be considered. Will an uncommonly able ex-premier as President, and so able a premier as M. Briand, work together in harmony to the public good? Just what redistribution of initiative will be attempted, now that easy-going Fallières is succeeded by a younger and more alert intelligence? The choice of a real leader to head the nation is at least in striking accord with the spirit of the age, both in Europe and in our own country—where the executive function is already more firmly controlled by the nominal executive, and where there is a growing disposition to look to the State Governor or National President for legislative leadership. This is a pragmatic era, and not in philosophic thought only. The world has found its voice—insists upon results. And it fails to see how results can be attained without conferring authority upon the executive branch of Government, whether in city, or State, or Nation.

The Irish Home Rule Bill

Again, so many years after Mr. Gladstone's death and that of Parnell, an Irish Home Rule bill has been approved by the British House of Commons by a majority of 110. It is ridiculous to claim that it has been carried by a swollen representation from Ireland, for if the Irish membership were reduced to forty-two, as it will be after home rule, the bill would still have had the comfortable majority of seventy-two.

This does not enact the bill, but it makes enactment almost sure. Mr. Gladstone's Irish bill could be and was killed in the House of Lords; this bill cannot be killed by the adverse Lords. The last Parliament attended to that matter. It took the fangs out of the mouth of the other house. The House of Commons past a bill reducing the power of the Lords, and when they rejected it an appeal was made to the country. Under the new election the Liberals returned to power and again approved the law; and, when it came again to the Lords, they were compelled to accept it under threat of being swamped with a hundred new Liberal Lords. Now, when the Lords reject a bill approved by the Commons it comes back, within a specified time, to the Commons, and if re-enacted becomes law. The House of Lords is now called the Lower House of Parliament, not the

Upper. The Commons have final supremacy, and the Lords can only delay by a veto that can be overruled.

So after nearly a generation the Home Rule bill awaits its sure rejection in the Lower House, the penultimate step to its becoming a law. Under it the Irish Parliament will consist of a Senate of 40 members, at first appointed, but their successors elected, and a House of Commons with 164 elected members. It will be subordinate to the British House of Commons, and will have local powers only, and its acts can be vetoed by the Crown. No act can be past favoring or penalizing any religion. The representation in the British Parliament will be reduced to 42.

The final enactment of this bill will almost certainly end the Irish disloyalty, which has been marked not only in Ireland, but in Canada, Australia, South Africa, New Zealand and in the United States. There is every reason to believe that Ireland will become one of the most loyal sections of the British Empire. The only sparks of disloyalty will be in a fraction of the Protestant minority of Ulster, for a large number of them favor home rule. The opponents have been viciously bitter and have made ridiculous threats of war. They have pretended that the establishment of a local parliament, like one of our State legislatures, would be the dissolution of their connection with the Empire.

The Ulster hotheads might be expected to talk in this irresponsible way, threatening rebellion and bloodshed. But it is not pleasant to hear such seditious words from Mr. Bonar Law, leader of the Unionist party. He declared in his final speech before the vote was taken, that the bill could not be imposed in Ulster without bloodshed, and he continued:

> No rebellion would be better justified. The men of Ulster are ready to give up their lives at the hands of British soldiers. If they shoot down a hundred in Belfast, two thousand will be ready next day to share their fate.

That is provoking and justifying rebellion. But such talk is comedy for the galleries. It frightens nobody. There will be no Irish legislation to justify sedition. There may be a paper government set up by crazy people in advance of any grievance, but it will be only laughable.

This first task done by the House of Commons, there will follow the bill disestablishing the Anglican Church in Wales and another abolishing plural voting. These, and the laws already enacted, will make a magnificent record for the greatest Parliament since Cromwell.

The Canadian Battleships

Mr. Borden, the Canadian Premier, who came into power thru the rejection of reciprocity which had been supported by the Liberal Premier Laurier, is likely to have a hard time of it in carrying out his bargain with Great Britain, paying in battleships for the right merely to send a representative to the Imperial Defense Council. It is now made clear that this Council has only advisory powers, while any decision must rest solely with the British Cabinet. In the Council Canada's representative would have the right to advise only on questions affecting the colonies, and he will have no effective vote on any subject. We do not see how Canada can get any advantage or any dignity out of that, such as will be worth the expense of three dreadnaughts.

Nor can Australia see any advantage in such a plan for herself. She is willing to create a small navy for her own use, but her Premier says that it would not be worth while to send a representative to be a mere adviser in a Defense Counsel which itself has only advisory powers. We fear that the Canadian dreadnaught scheme of which Premier Borden was so proud, and which was received with such acclaim in England, will weaken rather than strengthen the ties with the Mother Country.

In Brief

It is curious in these days when we are told that the Church has lost its influence that there should be so many causes clamoring to secure the influence of the Church.

We thank Senator Root for introducing a bill into the Senate repealing the provision of the Canal Act which allows American coastwise vessels to pass free. That is better than to go to arbitration.

The marriage of Prince George of Bavaria and his wife has been dissolved by the Bavarian Supreme Court. That recognizes marriage as a civil contract under civil law; and that in a Catholic State.

They say they can't find the man who won the $300,000 prize in the Bank of Italy lottery. They say he may have been lost in the "Titanic." One wonders if the ticket were really sold; it is a bit suspicious. A lottery is a fraud at its best.

THE INDEPENDENT was one of the first journals to call attention to the possible dangers involved in the proposed Rockefeller one hundred million endowment for the benefit of the people. Those dangers have all been eliminated in the new charter, and Congress ought to grant it.

Repeated reports come from the seat of war of fearful massacres of Moslem men, women and children by Servian soldiers and irregulars, and in some cases by Bulgarians and Greeks. We have been in the habit of denouncing such atrocities by Turks, and now it would seem that the worst of Turkish massacres have been equaled by Christians —such Christians!

The inaugural ball is no part of the inauguration. It is a scheme to make money at the expense of the government. It costs the government $95,000 and gives the Pension clerks two weeks' vacation. Governor Wilson is right in desiring it omitted. Let them have all the balls they want in public halls, not in the Pension building.

Here is a statement which we came across in a most worthy review:

> American industry is not free as once it was free; American enterprise is not free; the man with only a little capital is finding it harder to get into the field, more and more impossible to compete with the big fellow. Is it true? Is there not a very free field for business ambition? Cannot even a woman with a little capital invest it easily and get into the field? Were there ever more fields open for one who wanted to rise?

Who says this? Governor Wilson in the *World's Work*.

The new parcel post is immediately justifying itself. Six million packages were handled the first week, and when the people get used to it the number will be immensely increased. It seems strange that it was so long delayed; but we know the reasons, four express companies, more merciless than Juno who sat cross-legged at the door to prevent the birth of Hercules.

The first thought raised by the conviction of Judge Archbald by the Senate is one of gratification that such cases of delinquency are so few. The Federal courts are practically incorruptible. Not one case goes to the Senate in a generation. The next is, that judicial honor must be cleaner than avoidance of criminal bribery liable to indictment. There must be no smell of corruption. The third is that the Senate is not the proper court for such impeachments.

We would not have our readers misled by an editorial in one of our leading New York dailies which criticizes the language of an order to the students at the Naval Academy beginning, "None of the modern dances are to be performed." It says that "none" is singular, not plural. Not at all. It has been plural for at least fine hundred years. The Oxford dictionary says it is the common usage, *no one* being used for the singular. Don't hesitate to say "None are."

The Catholic churches in our cities have been very slow to obey the excellent rule imposed upon them that they must not have a collector at the church door to take a fee from every worshiper. But they are doing better now. In the Cathedral in this city the table is inside the door, by the last pew in each aisle, where is a man with a table. Those who enter the middle aisle are expected to pay twenty-five cents, and at the other aisles ten or fifteen cents; but one who slips by without paying is not stopped.

The Dominicans under Père Lagrange, whose writings have lately been condemned, have had charge of the institute in Jerusalem. The cable dispatches announce that a new institute for biblical study has just been opened in Jerusalem, and carefully explains that this new venture is not the Dominican school. No, but it is a fresh onslaught on the Dominicans. The Pretorian Guards, as the Jesuits love to call themselves, will be on the war-path, as long as they are in power; in other words, while Pius X lives. Let the Balkan peoples have the city of Constantine; the Jesuits, now in possession of the city of Augustus, sigh for that of David and Solomon.

The Federation of Peace

A Proposal for an American Peace Building

By Samuel T. Dutton

[There is no more devoted and efficient peace advocate in the United States than Professor Dutton, who holds the chair of Educational Administration in the Teachers College of Columbia University and who is Secretary of the New York Peace Society and a member of most of the international organizations mentioned in his suggestive article.—EDITOR.]

In all efforts to break down international barriers, to promote friendship and to make war between the great nations impossible, New York has already assumed a position of leadership. As the metropolis and leading port of this great western republic, holding a commanding position in respect to world commerce and finance, and becoming more and more a great meeting place of the nations, the position of the city is eminently strategic and influential.

New York has been prominent in the movement for international peace. The first peace society in the world was founded here in 1815 by David Low Dodge and was the germ of the present American Peace Society. The greatest of all peace congresses assembled here in 1907 with delegates from nearly every State in the Union and from several nations of Europe. Here the greatest endowment for peace has been made by one of our honored citizens. The New York Peace Society was founded in 1906 and several other organizations which have come into being since that time are carrying on propaganda here and elsewhere, and have assisted in pushing forward various measures for world peace.

Moreover, several other international societies have been formed in recent years, which are so many strong pledges of good will, justice, and friendship between the United States and the nations in which their efforts are chiefly directed. Among these may be mentioned The Japan Society, The American Scandinavian Society, The Pan-American Society, The German-American Society, The China and Mexico Societies.

The Japan Society alone, with nearly one thousand members, with branches in Japan, thru its publications, exchange lectureships, its exhibitions, its pilgrimages, and its hospitality, has practically eradicated all war scares as far as Japan is concerned, and has driven the jingoes into obscurity. The American-Scandinavian Society, supported by The Niels Poulson Foundation of more than a half million dollars, is devoted to the building up of cultural relations between the Scandinavian peoples in America and the home lands and the intercollegiate exchange of students.

The Pan-American Society, which may be regarded as a sort of right arm of the Pan-American Union in Washington, is interesting men of commerce in the possibilities of trade which lie at our doors, thus binding the United States to each of the twenty republics of Latin-America with ties of mutual interest, giving her an influence transcending the Monroe Doctrine or any other shibboleth of former times. Other societies having similar purposes and aims are destined to be of importance.

Has not the time arrived for steps to be taken toward federating all these forces in New York looking to coöperation, economy, and efficiency? The most practical means of accomplishing this seems to be the establishment of joint headquarters for the offices of these organizations, and in having a governing or advisory board to devise plans for more united and concerted action. Each society would, of course, continue to be autonomous carrying on its own special work, but thru some simple method

of federation coöperation would be secured. Thus these societies devoted to World Peace would epitomize in some way the great aim for which all such societies are working, namely, the federation of the world.

The idea of joint headquarters points at once to the need of an international building dignified and appropriate, which would become a great center in all these undertakings. Such a building might be dedicated as a memorial to "One Hundred Years of Peace between English speaking Peoples," as well as to other persons and events which deserve an enduring place in the memory of men. Such an international building should contain a common library and reading room with books, documents and periodicals relating to world affairs, in charge of a person competent to organize such a collection and to give desired information. There should be a large lecture hall, conference and committee room. The different national groups would naturally have suites of rooms furnished and decorated in the style of the nations represented. Hospitality would properly be a feature of such a center, hence the need of drawing, reception, dining, and guest rooms. Is it difficult to see what an influence might proceed from such an arrangement? It would be easy at all times to bring the officers of these societies into conference. Supposing a crisis were to arise, and it were found desirable to bring to bear at some point the united potency of the peace forces of New York. At present the societies being scattered and having no coordinating agency, they would be measurably impotent; but under the proposed plan all their combined machinery could, within an hour, be set in motion. These societies would grow rapidly. Others would come into being until all the great nations were represented. It is difficult to conceive of all the benefits that might arise. Thru joint efforts it might be possible to organize a museum illustrative of those agencies, social and official, which tend to make the world one, showing that "Peace hath her victories no less renowned than war." The joint membership of all these groups would, naturally, thru a simple plan of union, constitute an international club or brotherhood, the most cosmopolitan and the most interesting of all clubs in the world. It might be expected that similar centers would be opened in London, Paris, Berlin, Vienna, Rome, and Constantinople.

An international brotherhood encompassing the world would naturally result. Any member would be accredited and would be at home in any of the international centers. National and even municipal governments might properly be asked to aid in establishing these centers. Thus the social mind and the international mind would be cultivated as it has not been before and bonds of friendship would be strengthened and broadened.

Here at length gentle Peace would have a voice and a domicile. She could the better stand up and plead that justice and honor be set in the place of rampant militarism and cruel war. The possibilities wrapt up in this suggestion must appeal to the business acumen of men who are called upon to finance the several societies. It must appeal to the imagination, the farsightedness, and the faith of some of our citizens who have already made large gifts to the service of mankind. A strong argument for this proposition is seen in the critical nature of the present international situation. The exertions of chancelleries and rulers who desire peace deserve the support of all righteous and high-minded persons in any attempt to lift the pall of war which now hangs over the world.

New York City.

Why I Quit Farming

By Battell Loomis

ILLUSTRATED BY H. KERR EBY

If matter is composed of fluid electricity, why, when a glass cracks, do the electrons not gradually flow together again, healing the crack? They don't. Fear or any kind of panic is very much like that, but not quite, for the cracks caused in the spirit by it may be healed if the will is up to the job. Mine wasn't and that's why I feel like telling on myself for a coward. Cowardice is despicable. I have always held it, even tho admitting circumstances in extenuation. So, if I prove the coward, I see no reason to keep it from the world. I wouldn't be silent if some one else proved so, picturesquely.

By the way, one of the beauties of writing in a personal tone is that you can tell the truth about yourself and no one will believe you. That is how the saying, "Truth cuts no ice," was originated. On the other hand, if you lie, you will always be believed and that is why it takes a wise man to lie without getting into trouble. The main point in either case is to make the story interesting, then, whether believed or not, it will be remembered.

"DID YOU EVER FEED PIGS?"

As to the propriety of setting down personal experiences, what's wrong with the practice? People like to peer into diaries when a man is dead, and if a man does not hanker after that unappreciable thing, posthumous fame, why should he not publish his diaries while alive and sit and smile in smug satisfaction over the notices? Think what arrant fools Cellini, Pepys and Sir John Evelyn were to die when they did. I, for instance, might *imagine* myself doing a whole lot of amazing things, but what's the use; where's the originality in that? Anyone might do it. Only one person, however, myself, can do the things I do in the time, place and manner of my doing. That's why you, the reader, are dying to know what cowardly thing I have done. That's why I'm going to stop debating the question of advisability and come right out with it, to use the expressive idiom without apology.

Lack of ambition, due to a realization of the futility of fame or fortune, first led me to become a shuttle. After shuttling a while, the real zest of the game kept me at it. In that way I skimmed thru publishing house situations, tried to be a self-confident, impudent skirmisher for news and found myself "too soft"; tried surveying in the West and broke my arm with the help of a "gentle as a kitten" bronco. After watching a kitten play and the stupendous proportionate energy exerted and after raising that play to the power of a horse, I can understand why the "gentle as a kitten" argument will always preserve me from tempting fate with a steed so advertised. I

also tried making butter, working in a garage, a hotel and a livery stable; driving an ice-wagon and toting the steam contents; working in a library and selling photographs, and all these things led me to conclude that farming was worth looking into.

Well, when I came to the farm, the fact that it was a horse farm didn't mean much to me, because there was a man to look after the animals and I like 'em anyway. Another fact that didn't strike home was that there were cows to be milked, not to mention the unmentionable task of feeding pigs. Did you ever do the latter? If so you will appreciate *cochon;* if not, I'll tell you about it soon enough. What did strike me in connection with farm life, was the out-of-doorsness of it, the wide scope for the play of ingenuity, skill and strength and the fact that the city was too far away to make me mourn for the deterioration of free-born humanity into a mere herd of sheep, goats and wolves indistinguishably mixt.

I had been enjoying myself doing "odd jobs aroun' " for a week when the horseman went on a spree and received his pay.

"Now, Bat"—I was called that even if it is something like my real name—"Now, Bat," said my employer, "you can look after the three studs, five mares, gelding, three colts, four sows, two cows, two calves, two hundred chickens and the wagons at this farm or you may care for the sixteen brood mare, six sows, and forty-five pigs at the upper farm—whichever you like."

"I DREW UP THE SHAFTS"

Now the sixteen mares all had to be put in separate stalls each night and if they chanced to get in the wrong places, which they always did, pretty pesky situations might develop. I felt of the thickness of my skin, molded a bone or two and considered the heft of a mare's hoof, multiplying it by thirty-two, and came to the reasonable conclusion that I was too green to handle *that* job. Therefore I chose the studs, poultry, cattle and minor swine.

My first day of it was fun. To tell

about it will be enough to complete my history of myself as a farmer and coward. You will notice that I keep tempting you with the appellation "coward." That's a sly artifice much used by authors to keep their readers' interest focussing toward a climax.

That day I arose at 6:30. It was December and the stars shown thru my morning breath like diamonds in a veil of gauze as I trod lively toward the barn. With hay down and stock fed inside of half an hour I felt pretty chipper as I backed the Cob out of her straight stall (the inside one of four) and started out to hitch her up for the Boss. She was nervous, but I wasn't afraid of her. She balked behind Duchess, however, and I didn't know what to do. I coaxed until the sound of my futility must have got upon the big white mare's nerves, for she helped me out by kicking the Cob viciously. The Cob had two more quiet beasts to pass, so she leaned against Duchess' flank and meditated. Duchess gave her a clean swipe in the belly. The Cob came to a decision and moved, but I was quicker and preceded her to the shed, where I did a skirt dance with her, her feet just skirting mine. "Whoa, Cobble, whoa, Baby, there's a good girlie," said I, and finally got her quiet enough to walk straight when I hitched her in the doorway and flung the harness on her. Her stubby tail switched like a low-geared metronome. A sign. I didn't have the code book handy, so I drew up the shafts. They touched her and like gunpowder she fractured the cross-bar and, there being nothing left in the way, she padded the air like a too-heavy-in-front aeroplane. I understood Pegasus at that moment, but I stood out from under her and let 'er flicker. She flicked. At length she stopped and I gingerly pulled up the other wagon. This I managed to save before it was kindling. The Boss came, said, "That mare's badly frightened," and turned her out to pasture to cool off.

So I went to milking. An hour and a half later, the Boss came and completed the job. My hands are aching yet. Try squeezing a hose 150 times with each hand if you don't believe it. Then, belated, I went to feed the sows. I walked fearlessly into the pen wearing a decent pair of trousers and carrying a pail of middlings. The sows huddled about my legs, if ceaseless and insane activity in a huddling posture may be called huddling, and one succeeded in snouting the pail over so that half the contents rested in my shoe. I reached the trough and poured the remainder of the mash into it. Then I sat pig-a-back because a sow rushed between my legs and made me. When I left that pen most of its mud went with me, fast to my trouserlegs. I turned out the mares to pasture without having to chase them more than a mile each and then turned my attention to the studs.

If you want to see a beautiful animal, look at a thorobred horse. If you want to see equine beauty when it is terrible, look upon a stallion rampant. I patted the nose of Ormion as he

"I UNDERSTOOD PEGASUS AT THAT MOMENT"

"AND I, THE COWARD, BEAT IT"

looked over the paddock gate at me and then I opened the gate and discovered his fore-feet dangling over my head like over-ripe horseshoe crabs on a pear tree. "H'y'anck, w'atzermatter'th you!" I exclaimed, in my terror, and the glorious Remington bronze—done by someone else—became a peaceful four-footed horse again who eyed me interestedly and came to nuzzle my hand. I wasn't in a nuzzling mood when I found his teeth were bared for biting, so I yelled another order with a tail of words such as mother never taught me tacked on and with fear and trembling walked across the paddock to his stable door to pour him his water. When I came out it was by another door, but alas I was not alone, for with me I led a two-year-old stud who had to be escorted to pasture daily. He was in a rollicking good humor, but his dancing and prancing and glancing had little to do with enhancing my joy in the journey. He wanted to nibble my hand in play and he wanted to run backwards and sideways and every way with such kaleidoscopic changes that I never was certain where his feet were except when they grazed my shoe leathers. It was a sad few minutes for me, because in them I rehearsed all the things I had ever done in which I was likely to be found out.

"It never can happen again," I said, quoting the benevolent De Morgan as I neared the house with a whole skin, When I reached the house things were going on. Pib, the pup, had killed the cat and his sire had bitten the cook's baby. Baby was being sopped with peroxide by the Boss and massaged with electrocuting groans and wails by his panic-stricken mother. Pib was waiting to have the cat's carcass tied to his collar as a potent reminder. Cats kill rats; dogs don't. Climatically I spoke to the Boss:

"Farm-life is too exciting for me, I guess. I'm afraid to handle the studs, the pigs have no regard for my person and affect ill-manners at table and the cows will wear my arms out long before I succeed in detaching their udders, so I guess you'll have to get a man who has been in training for this sort of thing. For me, I'd rather dodge subway trains while sweeping the tracks," I said.

"Well, if that's the way you feel about it," said the Boss, slightly irritated by his manifold duties in retrospect, deed and prospect, "beat it before I come skating after you with a bill for carriage repairs."

And I, the coward, beat it.

Vigil

By William H. Hayne

Sorrow o'erflowing in a rush of tears
May hint of heartbreak thru the empty years,
But, ah! the anguish of the tears unshed
In eyes that keep dark vigil o'er their dead.

Augusta, Ga.

New Forms of Financing

By Franklin Escher

EDITOR OF THE MONTHLY REVIEW "INVESTMENTS"

Never before in our financial history has there been a time when as much financing has been accomlished thru the issue of new and unusual forms of security as at present. Seven per cent. industrial stocks, income-bonds, debentures, notes, "convertibles"—all these are securities which have been issued at various times in the past, but never before in any such quantity as during the past couple of years. Ten or twelve years ago when the era of corporation promotion was at its height, a good deal of financing was done by means of securities hitherto little used, but the total of such securities issued at that time would figure as but a small proportion of the total recently issued. In all our financial history, indeed, no time can be found when corporations wanting money have had to resort to such unusual forms of financing in order to get it.

For this the rise in commodity prices—what is familiarly known as the rise in the cost of living—has been responsible to a greater extent than anything else. With the rise in the cost of life's necessities there has come a demand on the part of the investor for a higher rate of income from the securities he buys. The old four per cent. investment interests him no longer. The dollar doesn't go as far as it used to, is his cry; give me a security which yields more income. And to that demand business interests wanting to raise money by the sale of new securities have had to bow. They have learned thru their bankers the kind of securities the public wants and have arranged their financing accordingly. It has simply been a case of the lender dictating the terms and the borrower having to comply with them.

Most important, probably, of all the new forms of financing, has been the issue of preferred industrial stocks. New? We hear someone say; why, preferred industrial shares were issued by the hundreds of millions a decade ago when the big capital combinations were being formed. Very true, but not the kind of preferred industrial stocks which are being issued at present. Many of the preferred industrials put out at that time were securities of good quality and have since proved their worth. But the preferred industrials now being sold in such quantity are really an entirely different kind of security—so hedged about are they with provisions and restrictions intended to safeguard the buyer that they have but little in common with the issues of ten years ago.

Of these provisions the most important are those which refer to voting-power; to the amount that can be taken out behind the preferred stock by the payment of dividends on the common and the amount that can be put ahead of it by the creation of fresh mortgages; and, thirdly, to the creation of sinking funds to retire the stock. Of the first of these provisions, those regarding voting-power, it is only necessary to say that it is usually stipulated that in case the company fails to pay the regular dividend on the preferred, the shareholders are entitled to take charge, elect the board of directors, and run the company in their own interest. The second provision referred to, too, puts the preferred shareholders in a very strong position, it being generally stipulated that without their consent no mortgage indebtedness can be created. And not only that, but in most cases there is a provision strictly limiting the amount of dividends that can be paid out on the common stock. If nothing in the way of a prior charge can be put ahead of the preferred shareholders without their consent, and the amount of money which can be taken out of the company below them is limited, it is evi-

dent that their interests are effectively safeguarded. And as to the third provision, the creation of a sinking fund, that further strengthens the position. A certain proportion of the company's earnings, it is usually stipulated, must be set aside for the purpose of eventually retiring the new stock.

Not all the new preferred shares now being brought out carry the same provisions, but where the issue has been undertaken by a reputable banking house it will invariably be found that the attending restrictions and stipulations are such that the buyer runs far less risk of loss than in the case of the preferred industrials issued ten or twelve years ago. In the great majority of cases, indeed, the degree to which the investor's interests are safeguarded is quite remarkable. That, of course, is simply because the investment bankers of standing, forced by the popular demand to handle high-interest-bearing issues of this sort, are determined that their clientèle shall not lose money thereby. To even the biggest and strongest companies wanting to raise money by the sale of preferred stock, therefore, these bankers say, Very well, we'll handle your new stock—but the issue has got to be made on the terms and carry the provisions we dictate. We don't want to place with our customers anything that in the long run will come back on *us*.

Why are these companies willing to stand for such restrictions and stipulations? Simply because they need the money, and find bankers unwilling to get it for them on any other terms. Take almost any of the big industrial corporations which have recently put out this new kind of preferred stock and it will be found that a big business is being done—a business limited only by the amount of working capital. In almost every case these companies could do a bigger and more profitable business if they had more money to work with—even money borrowed at 8 or 10 per cent. That is what makes them willing to agree to the bankers' stipulations, The alternative is between agreeing and not being able to get the money at all.

The new preferred shares as a whole are a high-class form of security—there is no doubt about that. But there is one thing about them which the buyer is bound carefully to consider. That is that their marketability—their hypothecary and conversion value—is in almost all cases of low degree. Some of these new stocks are listed on the New York Stock Exchange, but the great majority of them are not and are little traded in. It isn't always easy to sell them, especially in quantity. The issuing banking-house usually stands ready to take them back at a price, but that price is apt to considerably lower. Having bought these shares, the investor, in the great majority of cases, is bound to keep them or to suffer some loss in turning his principal back into cash. Whether his circumstances allow him to put himself in that position for the sake of getting a high rate of income, he is the one to decide.

A second form of financing almost unknown in this country up to within a year or two ago, but since then extensively used, is through the issue of income-bonds. Income-bonds are intended to occupy the middle ground between preferred stocks and the regular mortgage issues. Sometimes they come due at a fixed time like any other bond; sometimes, like British consols, they run in perpetuity. But in every case there is a provision that if the company cannot, at any time, pay the interest, it cannot be put in bankruptcy in consequence. In some cases the bond-holder simply loses and has to sit down and await more favorable times. In others, the interest is "cumulative," and, if not paid, piles up to the bondholders' credit and must be taken care of before anything in the way of dividends can be disbursed on the shares.

From the borrowing company's standpoint the advantage of issuing income-bonds is that it keeps itself out of a position where, if business

gets bad and the interest cannot be met, the bondholders (as in the case with mortgage issues) can rush in and seize the property. Take, for example, the case of the Denver-Rio Grande Railway, which recently issued bonds of this sort. Because of its guarantee of Western Pacific's debt the Denver got itself into a precarious position and one in which the need of more working capital was imperative. To sell stock was out of the question, and so heavily mortgaged was the property already that to put out another mortgage issue at anything like a decent price would have been impossible. It was then that the issue of a cumulative seven per cent. income-bond was decided upon. The high rate of interest would make the bonds "go", and if during the road's process of rehabilitation a time came when the seven per cent. couldn't be paid, the interest could be passed without the property being lost to its owners.

From the investors' standpoint, the great advantage of the income-bond is the high rate of interest it yields. There is always the chance, of course, that the company will run into a period of poor earnings and be unable to pay the interest at all, but where the bonds carry a "cumulative clause," there is the probability that business will get better after a while and that the back interest will be paid up. That, of course, is the risk the buyer of these bonds takes in exchange for the high rate of income he gets as long as everything is going along well and there is no default. Needless to say, bonds of this sort are strictly in the class of "business men's investments" and highly unsuitable for the investment of the funds of those dependent upon income.

A third form of financing, common enough abroad but little used on this side until very recently, is through the issue of debenture bonds —that is to say, bonds which have no mortgage provision whatever and are long-term promissory notes pure and simple. Many years ago, when financing operations in this country were subject to European influence to a greater degree than at present, some of our prominent railways issued debenture bonds to a very considerable extent. Then, for a long series of years, investors were found unwilling to take bonds of this kind, and it is only recently that the practice of issuing them was revived. Now, apparently, there is again a very fair demand, and bonds of this sort are being issued at considerable quantity.

From the investor's standpoint, it is all a matter of earning power. The debenture of a road like the New Haven or the St. Paul is sure of its interest. What then is the particular advantage of the mortgage feature? As long as there is any question about the property's earning power it is a comfortable thing, of course, to have the mortgage provision there; but in the case of a road which, over a long series of years, has demonstrated its ability not only to earn its bond interest, but to pay liberal dividends, *is* the mortgage feature of such very great importance? In the case of the investment of trust funds, yes—earning power, there, however satisfactorily proven, is not enough. In the case of the investment of the business man's surplus, no. The business man wants his money to be safe, but he doesn't want to pay for any excess safety. The mortgage bond of a road like the New Haven may be safer than its debenture bond in the same sense that a wall three feet thick is safer than a wall one foot thick, but the money that goes into the extra bricks comes pretty near being waste.

A fourth important way in which financing has lately been done to a far greater extent than at any time in the past, is by means of the issue of short-term notes—bonds, secured and unsecured, maturing in five years or less. Back in 1905-06 a good many of these notes were put out, but not in anything like the quantity in which they have recently been issued. For the past year, indeed, it

has been practically the rule, when a railroad wanted to raise money by selling securities, for it to put out notes instead of bonds.

The reason has been, very simply, that for the past year or two it has been practically impossible to market long-term bonds on a profitable basis. Many a road, approaching its bankers with a proposition to mortgage important parts of its property, has been offered so low a price for the bonds that it has decided to issue short-term notes instead. On these notes a high rate of interest has got to be paid, but, at any rate, it has only got to be paid for two or three years—instead of for a long period of years, as would be the case were long-term bonds put out at an unfavorable price. And in two or three years, the railroad figures, conditions may be different than at present. Very possibly by the time the notes come due it may be possible to redeem them with the proceeds of an issue of regular mortgage bonds sold at a satisfactory price.

From the standpoint of a corporation in need of money and unwilling to obligate itself to pay a high rate of interest over a long term of years in order to get it, the short-term note offers the solution of the difficulty. But the issue of such notes, it is plain, is nothing but a makeshift form of financing. The market for long-term bonds isn't favorable now—in a couple of years maybe it will be—let us, therefore, not saddle our property with mortgage bonds sold at a discount, but let us put out notes instead. Let us do the best we can for the present, trusting that the future will make it possible for us to pay off these notes with the proceeds of long-term bonds sold in the regular way. Let us, in other words, *postpone* our financing till a more favorable time.

Now the investor who buys these short-term notes is virtually laying a wager that the company issuing them is wrong. If the company is right about the current market for bonds being too low for it to sell its long-term obligations in, then it is certainly the business of the private investor to take advantage of the low quotations and not wait until the expected improvement has materialized and the bargains are all gone. That, if he buys short-term notes at a time when they are being issued because regular bonds can't be sold, is exactly what he is doing. He puts his money into notes on the idea of being able, a few years from now, to buy long-term bonds cheaper than at present. The company issues the short-term notes because it believes exactly the opposite —that bond prices will be higher then than now. Which is the more likely to be right?

For banks and individuals wishing to employ money temporarily at as high a rate as possible, and with no idea of waiting for a better chance to buy bonds, short-term notes offer an attractive form of investment. But for the requirement of the ordinary investor they are not suitable—unless, indeed, he believes that the issuing companies and their bankers are wrong in their opinions, and that if he holds his money ready in short-term notes for a couple of years, the opportunity to buy bonds at a lower range of prices will present itself.

As to the effect on the market of the issue of all these various new forms of security, it is less than might be imagined. There are two reasons why. The first is that most of the new issues are securities of high class. The second is that the greater part of the new shares and bonds are passing direct from the hands of the banker into the hands of the investor—the ultimate consumer, so to speak. In the case of some of the issues a digestive process, to a certain degree, is necessary. But the great bulk of these new shares and bonds do not come on the market at all. They are placed direct with clients by the banking houses bringing them out and, so placed, are apt to remain where they are for a good while to come.

New York City.

Making Over the Schools

The Opinions of Experts on the New York City Schools

By Tristram Walker Metcalfe

[Fifty thousand dollars, nearly two years in time and the efforts of a staff of more in New York City. The reports are about to be publisht. The conclusions and recommendations—the result of intimate study of the work in the schools—are of vital importance to the whole country, for the problems which confront New York are the same which, on a smaller scale, other cities are facing. No longer are the people willing to take it for granted that their schools are doing good work. They demand the exact facts. It was because the Board of Estimate in New York City had been unable, for years, to secure, from the educational authorities, definite information as to school progress and needs to enable it to determine how large an appropriation should be made annually for the schools, that the board decided to call in experts to get the facts. The investigation covered building construction and janitorial service, as well as educational problems. As yet comparatively few of the reports have been made public. Those given out have dealt with the construction and care of buildings, the office and clerical work of the educational experts, and the organization and methods of the Board of Education, the last being the Moore report, discussed in THE INDEPENDENT, Nov. 14, Nov. 21 and Dec. 12, 1912. Among the reports still to be publisht are included the following: The board of superintendents, etc., by Prof. Edward C. Elliott, of the University of Wisconsin; "Promotion, Non-Promotion and Part Time," by Dr. Frank P. Bachman, assistant superintendent of schools, Cleveland, O.; "Intermediate Schools," also by Dr. Bachman; "Character of Teaching, Discipline and the Course of Study," by Prof. Frank McMurry, of Teachers' College; "Arithmetic Tests," by Dr. S. A. Courtis, of Detroit, Mich.; "High Schools," by Prof. Frank W. Ballou, of the University of Cincinnati, and Prof. C. O. Davis, head of the Department of Education, University of Michigan; "Commercial Education," by Frank W. Thompson, assistant superintendent, Boston, Mass.; "Vocational Education," by Prof. Herman Schneider, of the University of Cincinnati; "Compulsory Education," by Dr. Jesse D. Burks, director of the Bureau of Municipal Research, Philadelphia; "Ungraded Classes," by Dr. Henry H. Goddard, director of the research laboratory, New Jersey Training School for Feeble-Minded Children; and "The Organization and Methods of the Board of Education," by Profs. Goodnow and Howe, succeeding Prof. Moore. The vital recommendations of the investigation are still to be disclosed. A concise, yet comprehensive summary of them is here presented by THE INDEPENDENT by the school editor of the New York *Globe*.—EDITOR.]

It is a new view of education that the experts who have investigated the New York schools ask the public to take. The system devised to carry the child from the kindergarten, thru the elementary and high school into college must, they declare, give way to one which meets the needs of the majority of the children. Those needs must be ascertained accurately. New York hasn't such a system to-day. For that matter, few other cities have.

Public education, as interpreted by the New York school inquiry, must train efficient citizens. It must strive gradually to emancipate each child from external restraint and guidance, rendering him self-directing—intellectually, morally and physically stable, alert, vigorous and active. It must insist upon discipline that is wise, kindly and firm, providing for effective punishment when needed. The conscious effort must be to prepare each child to make the best use of his leisure, as well as of his working hours. Public education must make each pupil economically intelligent and efficient, and must lead him gradually to realize that a suitable vocation, accessible to him and adapted to him, is indispensable to a useful and happy life.

No matter how long he may be able to remain at school, as he approaches the end of his school career he should be under such instruction that he will come to see that his vocation will be both a means of satisfying his wants and ambitions and a source of such public service as he is capable of, and as he may be called upon to render.

The schools must, in this new view, provide for the development of vocational purposes based on vocational enlightenment. They should

offer each pupil appropriate training for the vocation of his choice. How they are to do this without too great a revolution is outlined in the various inquiry reports.

The present elementary school course of study covering eight years is condemned by Prof. McMurry because of its uniformity and rigidity, who shows how impossible it is to fit it to the widely varying needs of children in such a cosmopolitan city as New York is. Too much is prescribed, with the result that it cannot be carried out. The remedy is a flexible course, with a minimum amount of essential work prescribed and with a large allowance of unassigned time to be disposed of by the principal in elaborating the curriculum to meet the needs of the children of his particular section of the city. Thus there will be developed numerous type courses: one for congested sections, one for the better residential communities, and one for outlying districts. Having allowed the principal to work out his own curriculum with the limitation that the minimum must be included, the Board of Education should hold him strictly responsible for the results.

The suggestion is offered by Dr. Bachman that the elementary school course be so drafted as to be complete for six years, for seven years, and for eight years, so that no matter at what age the pupil's school career ends he will have had a complete course so far as he has gone, and not three-fourths or seven-eighths of a curriculum mapped out as an eight-year unit.

Facts as to conditions which make such a scheme desirable are presented in his report on non-promotion and part time. Of all of the pupils entering the elementary schools of New York, 3.31 per cent drop out before completing the work of the fifth year of the course; 11.29 per cent before completing the sixth; 38.55 per cent before completing the seventh, while only 40.33 remain to complete the course. It is the children who fall behind their grade one or more years who later drop out. Those who do leave do so about the fifth or sixth year. There is reason to believe that these conditions are somewhat typical of conditions in other cities.

Children are not held in the elementary school much, if any, beyond their fourteenth birthday—a condition which must be recognized in making up a course of study. In administering the schools it must be borne in mind that absence is one of the chief causes of retarded progress.

As a result of the application of the Courtis arithmetic tests to some 27,000 children, it was disclosed that the children were markedly inaccurate, altho fairly speedy. There was a low grade of proficiency, but New York City's pupils were no more deficient than pupils tested in other cities. They were no more efficient.

One other recommendation relative to the elementary schools is of prime importance. The abolition of corporal punishment has not, according to the experts, helped to better discipline. Prof. McMurry made a special study of the problem and recommended that the rod be restored, but that its use be restricted to the principal, or to some one person designated by him. An alternative, probably less effective, is the establishment of disciplinary classes.

Not only do the experts propose to change the curriculum, but a new organization for the schools is advocated. It is proposed to provide, wherever possible, that the elementary schools shall cover but six years of study and that the remaining two years be spent in intermediate schools, centrally located. There are three such in New York now. The experts have been at a loss to understand why more have not been organized. Into them are drawn off the pupils in the classes of the last two years of the course in neighboring elementary schools. Instruction is better in the intermediate school, and there is more economical use of the school plant and of the teaching force. Statistics were gathered indicating a loss of

children at the end of the sixth year —fewer pupils going on into the seventh year class in intermediate schools than into the same grade in schools with the full eight-year course, but the intermediate schools hold those who do go better. A larger proportion advance to the eighth grade and graduate.

By consolidating classes the rooms are more nearly filled to capacity and can be kept filled by combining classes as they are reduced in size by withdrawals. Fewer teachers are required, and the number of gymnasiums, kitchens, workshops and science rooms is less. They are used a larger proportion of the time. The intermediate school makes it possible to group pupils better according to their abilities, there being so many classes of one grade. These conclusions were reached after studying the three intermediate schools and full graded schools similarly situated. The definite recommendation is made that more such schools ought to be organized.

Greater attention must be paid to the mentally defective child. Special schools should be provided, according to Dr. Goddard. Expert medical inspection should be instituted to determine properly who are deficient; special courses of study are needed, and well-trained teachers. About two per cent of the children are sub-normal, or 15,000 in New York City.

Only a small beginning has been made by New York by organizing ungraded classes in the schools, into which the mentally defective are placed for special instruction, but the investigation disclosed that many pupils in other special classes were defective, that the children were not under the proper instruction, and that the medical inspection was not thoro. No statistics had been kept to show what became of the children after they left the school.

If the schools are to offer instruction to meet the needs of the children, vocational schools must be made a part of the system. New York has done little to provide such instruction. Vocational schools should teach skilled vocations to persons over fourteen who do not intend to go to high school. Two types are suggested as immediately practicable—the continuation and the coöperative school. The continuation schools are for those children whose employers will permit them to attend school a few hours a week without loss of pay; the coöperative school for those whose employers are willing to cooperate with the schools to the extent of allowing them to alternate between work and school.

The high school under the new system is conceived to serve the purpose of elevating the general level of intelligence, character and efficiency of those who enter it. The experts favor the cosmopolitan school in which are offered parallel courses leading to college, commerce and the trades. They would limit them to 1,500 students. In New York the schools are too large, they have too few teachers and the supervision too insufficient and ineffective. The special high schools of commerce and manual training, and the special courses in these subjects, are not meeting the conditions in New York. The commercial courses aim too much to prepare the young men for the higher positions instead of fitting them for the work which makes up 85 per cent of the positions open to them. The courses offer too little opportunity for the student to get related academic work.

Another essential to a proper educational system is effective enforcement of the compulsory education laws. There must be uniformity in administrative practice, prompt reporting of absence and an efficient staff of truant officers. Without these vagrancy will increase and the boy gangs will thrive.

To organize and conduct such a system of schools as proposed, the experts believe that there must be a small board of education with an educational council, composed of superintendents, principals, and teachers, rather than a board of superintend-

ents, such as New York has, and which Prof. Elliott finds serves no useful purpose which a council could not serve better. The powers of such board should be determined by legislative enactment and court interpretation. Funds for the schools should be appropriated in bulk and the board left free to use them as it believes the needs of the schools demand. It is essential that such a board have a bureau of records to systematize and improve the records and reports and another of investigation and appraisal which will test out new ideas and conduct experiments and determine the value of them before incorporating them into the system. It is held by the experts that the way to make progress is by experiment. The efficiency of the schools rests upon habitual self-examination and careful appraisal of the results disclosed. In education, it has been too long the custom to take too much for granted. Those of their recommendations which seem to merit it—and many of them are mere matters of opinion—the experts propose be tested out in this bureau which they ask be established in the New York City Board of Education as an essential to school improvement. It leaves New York to carry on the auto-inquiry.

New York City.

Injunctions

By Everett P. Wheeler

[The author of this article has been for fifty years in practice at the Bar. He has had extensive experience in Injunction cases and has been for five years Chairman of the Committee of the American Bar Association to provide remedies for the law's delay. His judgment on the subject of injunctions is therefore entitled to consideration, especially because he recognizes that there have been abuses in procedure on injunctions and was one of the lawyers consulted by the Supreme Court in the framing of the new Equity Rules which require all federal judges to conform the practice on injunctions to that which had in general prevailed but was sometimes departed from. A bill to limit the power of the federal courts to grant injunctions has passed the House of Representatives and is now before the Judiciary Committee of the Senate. The article of André Tridon in our issue of January 9 shows the attitude taken by the Industrial Workers of the World on this subject.—EDITOR.]

What is the matter with injunctions? Some of the labor unions seem to find them a great grievance. The House of Representatives upon their application has passed a bill regulating the issue of injunctions and formulating certain rules against abuse, which the courts had already laid down. To this no one can object. But the bill proceeds:

Sec. 266 c. That no restraining order or injunction shall be granted by any court of the United States, or a judge or the judges thereof in any case between an employer and employees, or between employers and employees, or between employees, or between persons employed and persons seeking employment, involving or growing out of the disputes concerning terms and conditions of employment, unless necessary to prevent irreparable injury to property or to a property right of the party making the application for which injury there is no adequate remedy at law, and such property or property right must be described with particularity in the application which must be in writing and sworn to by the applicant or by his agent or attorney.

And no such restraining order or injunction shall prohibit any person or persons from terminating any relation of employment, or from ceasing to perform any work or labor, or from recommending, advising, or persuading others by peaceful means so to do. Or from attending at or near a house or place where any person resides or works, or carries on business or happens to be for the purpose of peacefully obtaining or communicating information, or of peacefully persuading any person to work or to abstain from working; or from ceasing to patronize or to employ any party to such dispute; or from recommending, advising or persuading

others by peaceful means so to do; or from paying or giving to, or withholding from any person engaged in such dispute any strike benefits or other moneys or things of value; or from peaceably-assembling at any place in a lawful manner or for lawful purposes; or from doing any act or thing which might lawfully be done in the absence of such dispute by any party thereto.

The radical objection to this provision is that it is class legislation. It gives the trade unions exemption from restraint which is not extended to other organizations. It permits a trade union to violate its contracts with the employer to his irreparable injury and forbids the court to restrain by injunction the methods which the members of such unions commonly employ to enforce their demands.

It seems to me that the complaints on this subject, which have led to this attempted class legislation, fail to appreciate the true purpose and character of the injunction. I have had an extended experience in such suits, and have found the injunction an instrument of the great value in the cause of justice. It may be, and sometimes has been abused. It is a common American fault to argue that because a good thing is abused, it ought to be suppressed. But intelligent people when they reflect perceive that the true method is to correct the abuse.

This complaint against injunctions is really the direct reverse of the complaint which is even more common, that legal procedure is technical and dilatory. The procedure in injunction cases is neither. Either party is at liberty to put in any evidence it chooses without regard to the technical rules which prevail in the ordinary trial of causes, and the hearing is speedy. The whole arsenal of technical points by which cases are often procrastinated is of no avail here.

The true purpose of an injunction is to prevent irreparable injury. This may mean either injury that in the strict sense of the word cannot in any way be made good, or an injury the consequences of which will be such that the damage consequent upon it cannot be accurately adjusted, and so cannot be compensated by any money payment. In theory, the injunction is the defense of the weak against the strong. Conditions of society are such that some men have power far greater than others. This power may come from their greater wealth; it may come from their organization and discipline. But from whatever source it is derived, the fact of the power remains. Without the right of injunction it would be perfectly possible for such persons to commit wrongs against their fellow citizens and then, having attained the object they desire, to sit down and calmly await the result of an action for damages. In defending such an action, all the delays which are possible under our system of jurisprudence would be availed of; every technical objection would be taken; every possible appeal would be resorted to. In many cases the plaintiff would not have the pecuniary means to prosecute the suit to a conclusion; in many others the burden of contesting it would be so great that he would relinquish the contest and the aggressor would remain in possession of the field. Under our present system, when such an injury is threatened, the party who has reason to apprehend it may apply to the court and obtain an order immediately forbidding the aggressor to commit the wrong and requiring him to show cause why he should not be permanently forbidden to commit it during the pendency of the suit. The hearing in such a case is prompt. The evidence, it is true, is by affidavit and not subject to cross examination, but in point of fact the actual facts of the case are generally presented to the court. Both parties are heard by counsel, and the court promptly passes upon their rights. In case of doubt, the injunction is refused. But if the plaintiff has made out a clear case, it is granted. The aggressor still has the right to a full trial in ordinary course, with the

right of cross examination of the adversary's witnesses. But in nine cases out of ten he does not avail of this right. The injunction has defeated his nefarious attempt to injure or destroy someone who for some reason he wishes to assail, and he gives up the contest.

This may be illustrated by cases in which injunctions have been granted which speak for themselves.

When a mother has been awarded the custody of her children, an injunction has been granted to restrain a cruel husband from violently taking them away from her.

In the early days of telegraphy, when the Atlantic and Pacific Telegraph Company was trying to compete the Western Union, the latter company had the virtual monopoly of cable communication between America and Europe. It undertook to destroy its competitor by refusing to transmit cable messages that had come over its wires except upon terms which were prohibitive. The Supreme Court of New York enjoined the Western Union from refusing to transmit cable messages delivered to it by its competitor and required it to transmit them on the same terms on which it transmitted all other telegrams. At a later date Mr. Gould and Mr. Garrett combined to destroy the competition of the same Telegraph Company by refusing to allow it to use wires on the line of the Baltimore and Ohio Railroad, which under its contract it had a right to use and which were essential to its connections between the East and the West. Courts of justice both in New York and Illinois enjoined the railroad company from interfering with the use of these wires by the telegraph company, and when Mr. Garrett under advice of counsel violated the injunction the Superior Court of New York City made an order punishing him for the contempt and committing him to the county jail.

When the workmen in the employ of the Pullman Car Company could not agree with their employer and undertook to compel submission to their demands by preventing all traffic over the railroads centering in Chicago, Federal Courts granted an injunction against this unlawful interference with interstate commerce. President Cleveland enforced the injunction and the Supreme Court of the United States sustained the action of the court below. This was indeed necessary to prevent what was fast becoming anarchy in the whole district about Chicago.

It appears then that in all the instances which have just been cited, which might be multiplied indefinitely, the injunction was absolutely necessary to prevent violent aggression and to maintain the peace which all honest, hard working people desire.

In all cases of injunction there is a remedy by appeal. By the practice of most, perhaps of all courts, the appeals in such cases are entitled to a preference. Every facility therefore is granted by the present practice to prevent injustice in such cases. No doubt injunctions should not be hastily granted, but it is equally true that where they are necessary to prevent injustice they ought to be granted promptly and without hesitation. The whole debate on this subject brings us down to this proposition—that in civilized countries disputes between individuals or organizations should be settled peaceably. This can only be done through some tribunal that has power adequate to protect the rights of the party against whom injury is threatened. No organization, whether it be a trade union or a manufacturing corporation or a railroad corporation, should object to this. But even if they do object, the majority in this case should rule and it is in the interest of the majority that peace and order should prevail and that disputes should not be settled by resort to force.

New York City.

The Book-worms of New York

How the Public Libraries Satisfy the Immigrant's Thirst for Knowledge

By Carl W. Ackerman

Abe Martin, the quaint Hoosier philosopher, says, "Cheer up! What if you wuz a worm an' had t' live in a wild crabapple?" The immigrants who land in New York have found the answer to this conundrum; eat the fruit and crawl out.

For the first year or two they live huddled together in tenements on Manhattan. During that time they learn English, read thousands of books on science, philosophy and economics, as well as classical literature, and save enough money to move to the suburbs.

Some weeks ago the librarian of the Seward Park Branch of the New York Public Library, which stands on the business thorofare of the Russian Ghetto, investigated the addresses of fifty readers of three years' standing. The names were picked at random from the card index and only one still lived in that community.

Once on New York soil the most persistent work of the foreigner is self-education. His appetite for knowledge is more insatiate than that of the seminary student in the university. This is shown by the records of eight of the forty branches of the public library. During 1912 approximately fifty-three per cent of all books circulated from these centers were non-fiction, and of the forty-seven per cent of fiction more than half were the works of Dickens, Thackeray, Scott, Dumas, Shaw and Tolstoi. Modern fiction—the "best sellers"—remain dusty on the shelves. And these eight libraries are tucked between fire-escape-facades of the tenements in Poverty's Pocket of the metropolis.

The Bowery, at one time famous as the society street of the city, is now the toboggan down which the derelicts coast from the Tenderloin. Chatham Square is the end or "jumping off" place. Yet last October the library in this community circulated 12,281 books; of these 5860 were fiction. A record of 493 books read daily—and only 196 of them fiction. Of course, it is not the castaways who do the reading, but their neighbors, the aggressive, eager Russians, Rumanians, Greeks, Italians and Hungarians.

A stout, deep-eyed, dark-complexioned Russian came to the librarian of the Seward Park Branch several years ago and asked for books on advanced chemistry. He had read all those available thru the library, but lacked enough money to buy the more expensive and technical volumes. His request was similar to those she had frequently heard and she as often had been compelled to refuse. She knew the young man, however, and in a few days interested a chemist from one of the large manufacturing concerns of the city.

In the spirit of adventure this man climbed the stairs of a narrow Canal Street tenement and knocked at the door of an attic room. When the Russian admitted him the visitor stood at the threshold dumbfounded. He thought he was calling at the "bunk" of an immigrant. Instead he walked into a shabby but fully equipped chemical laboratory, hidden under the rafters of a five-story building.

Here was a young man who had been banished from Odessa because he was a Jew. He had sought political and religious freedom in the United States and did his first work in a sweatshop. From there he went to a clothing store, and in the evening tutored himself with public books. The few dollars he could save he spent for instruments.

Not many days after this meeting he was supplied with the latest books. He then passed the Regents'

examinations and now is professor of chemistry in a Brooklyn institute.

Preceding the recent presidential campaign the demand for books on political economy, trusts, finance and the tariff could not be supplied by these eight libraries. During the Dickens celebration five hundred volumes of the author's works were inadequate in one branch alone. There are times when one hundred copies of *David Copperfield,* in another library, do not meet the needs. Woodrow Wilson's *The State* is in constant demand. So are the books of William James, Henri Bergson and Professor Tausig.

By far the larger per cent of books read by these foreigners are printed in English. At the Hamilton Fish Branch, of 25,000 volumes only 1800 are printed in other languages. The 22,740 volumes in the Chatham Square library are divided into 19,541 of English; 1211, Yiddish; 680, Russian; 444, Italian; 434, German; 199, Chinese; 144, Modern Greek, and 87, French. The proportions vary in other libraries, the number of each depending upon the per cent of population in that locality which reads. The average is about one book in a foreign tongue out of every ten in English.

Formerly the boundaries between the different nationalities in Manhattan were as distinct as those dividing European countries. To-day these lines are gradually being erased. The Russians are invading all sections. The Italians are moving among the Greeks, the Germans and Irish. "Little Italy" is still a separate community, but not so exclusive as it was. Chinatown is really the only survival of bygone days.

Each nationality, however, still has its main business street. Houston Street, for instance, is packed every day by pushcart merchants selling their wares among Rumanians and Hungarians. New York has no Halsted Street like Chicago, where one can walk for twenty miles and at every sixth or seventh intersection enter a community of different people, but there are still many streets where only Italian, Yiddish, or Modern Greek is spoken.

In each of these communities there is a public library—so placed, not by design, but by accident. Their readers once were mostly of one nationality. Now various peoples read in all of them. In the evening the men who work in the stores, the factories, on the docks, or streets, come to the library for the books. Those who have families carry home the volumes as paternally as they lug food or clothing—perhaps more so if they happen to be very poor.

As soon as a new reader comes to the library he is acquainted with the card catalog and the arrangement of books. There are separate sections for history, philosophy, science, fiction and other branches. If the reader wants something on European history, he goes to the shelves in search, unless someone recommends a book to him. Then he consults the card index. As a result all are familiar with the system, and the attendants assist only in emergencies and in stamping their cards, making a record of the day the books must be returned. Even little girls and boys, eight and ten years old, know how to get the books. School teachers always suggest books for the children and Fiske's *History of the United States* is one of the volumes most in demand.

These libraries aid in every way to place good books in the hands of children. Only two days during the week are they permitted to look at picture books or read fairy stories. These days are Friday and Saturday. Perhaps it is the only place in the country where one can see children fight for books. They hasten in after school, scramble for places in a line at one end of the reading room, and wait for the attendant to stack the books on the shelves or dole them out. They count it as much of an accomplishment to get one of these books first as the mischievous lad glories when he succeeds in fooling a passer-by with his fake pocketbook.

A good many of the readers are

studying for the Regents' examinations of the College of the City of New York—a university maintained by the city. During the day they follow the occupations of their fathers, but most of them are spurred by a desire for leadership and they are picking education as a path to the goal. This is strikingly shown by the large number of clubs, debating societies and other organizations among the immigrants.

In this phase of the foreigner's life these libraries are also indispensable. All of them have large assembly rooms, where these organizations hold their meetings. Only one restriction is made—that religion be taboo. In this way these public libraries are performing the function of community centers which reformers in Wisconsin and other western States are making of school houses. Any group of people may meet here. At various times lectures on hygiene, civics and other topics are given by leaders in these subjects, and all of them are well attended.

The success of the immigrant in New York may be measured by the distance he moves from lower Manhattan after he has been here a few years. If he stays in the tenements it is invariably an indication that he is unable to keep pace with the progress of his neighbors. This is not altogether at the basis of the extreme poverty there, for many of those who are skimping are saving a few hundred dollars and awaiting the time when they can move to a suburb. Many of them cannot withstand privation. Disease handicaps them. This is especially true among the Russians. They have sold their homes in the far north to come to America—their libation for freedom. When they are forced to change from a life out-of-doors to one cooped in a tenement they suffer.

The librarians who meet these immigrants all day long study their characteristics. From their observations they say the United States simply gives an outlet for a further expression of the national aspirations of these people. The Russian who has been persecuted studies our government, and as a rule becomes a radical socialist. It is said that but for the corruption in one of the Congressional districts in New York a Russian socialist would have been elected to Congress at the last election. The Italian who likes to do tasks with his hands reads the more practical books. The Hungarian loves poetry and good literature. While the Russians show a preference for their own authors, such as Tolstoi and Gorki, they as a rule have read most of these books before they emigrate. They, however, reread many of them in English.

No one author stands out alone as the most popular among the immigrants. If a group were picked it would include Dickens, Dumas, Thackeray, Scott, Shaw, Ibsen, Shakespeare, Maeterlinck, Björnson and Tolstoi.

Altho these people are reading mostly English books, they are doing their own thinking and bringing into this country different ideals and standards. In a measure they all become Americanized, but they are also making the United States, and especially New York, a fusion of the Russian's radicalism, the Italian's practicality, the Hungarian's pleasure, the Greek's industry, with the frugality of the German, the loyalty of the Irish and the ambition of the Scotch. They are being educated in American public libraries, but their national traits are being felt—a very little as yet, but perceptible just the same.

An Italian came into the Hudson Park Branch one day to get some books and gave his name as "Bene."

"That isn't your name," the librarian insisted, but he said he wanted to change it from "Bernardino" because his American friends did not like to call him by such a long name.

He was working in one of the uptown stores and took a book with him on Practical Mechanics.

Columbia School of Journalism, New York City.

THE WORKER'S REAL BURDEN

"I don't care whether you are right or wrong. I don't know whether your cause is just or not. I haven't time to ask. . . . If you have to go back to work under unsatisfactory conditions, do it with your minds made up that it is the unsafest proposition in the world for capitalists to eat food prepared by members of your union!"
—JOSEPH ETTOR, OF THE I. W. W., TO THE STRIKING NEW YORK WAITERS.

Literature

In South America

The number of books on South America which have recently poured from the press is illustrative of the new interest of the world in the Latin Republics. Until some time after the Panama Canal has been opened, at least, this interest will continue. As far as Argentina is concerned, there can be no doubt that it will. That remarkable country — with its immense areas of fertile soil in the hands of a comparatively few proprietors, with the largest city south of the equator, with an American-Italian rather than a Spanish population, with racial and economic problems as acute and vital as those of Europe, with an export trade which already gives it first place among the nations as an exporter of frozen meat and second as a shipper of wool, with grain products ranking it third among the nations in corn production and fifth in wheat, with capacity for an immense increase of its crops—is already a nation to be left out of no reckoning of the world's resources and enterprises. Brazil is the only other nation to be classed with it; and while some sections of Brazil, like Sao Paulo and Rio de Janeiro, are experiencing a phenomenal growth, other sections have stood still or retrograded. What will happen on the West Coast when the Canal is opened no one can foretell. The populations are scanty, the agricultural possibilities negligible, the undeveloped mining resources problematical.

Books like *Through South America*,[1] *South America Painted and Described*,[2] *The Path of the Conquistadores*[3] are the ephemeral product of our passing curiosity. They are handsomely printed and beautifully illustrated, especially *South America Painted*, altho Mr. Faust's picture leaves on the eye an effect of far more greenness than a visit to all parts of South America will leave on the memory; but Mr. Faust does not seem to have been in Bolivia, and it is hard to believe that Mr. Koebel could have made much of a visit when we read his reference to "the ruin of Tiahuarnaco" and his statement that this land, so largely a barren waste, barely supporting now a population of less than 2,000,000, is "a land of such fertility and mineral resources that it could easily support a hundred million inhabitants."

The most valuable of all these books is naturally Mr. Bryce's *Observations and Impressions*.[4] It is not as searching and authoritative as his *American Commonwealth*. The passing years have brought with them a mellower and more indulgent judgment; and he is not as faithful a friend of South America as he was of the United States in pointing out weaknesses and evils which at any cost must be faced and remedied. Perhaps Mr. Bryce knew that the Latin American nature would take unflinching criticism even from so good and just a man far less kindly than the people of the United States can take it.

The first eleven chapters of Mr. Bryce's book are occupied with a keen, illuminating, and genially philosophizing description of the South American countries which he visited. The remaining four chapters constitute a sympathetic and penetrating study of the origin of these new nations, the relation of races in them, the relations of the two Americas and of Europe to South Amer-

[2] *South America.* Painted by A. S. Faust, described by W. H. Koebel. New York: The Macmillan Co.

[3] *The Path of the Conquistadores.* By Lindon Bates, Jr. Boston: Houghton Mifflin Co.

[4] *South America: Observations and Impressions.* By James Bryce. New York: The Macmillan Co.

ica, the conditions of political life in the South American republics, and some concluding reflections and forecasts. Mr. Bryce was interested, as every thoughtful visitor to South America must be, in the utter dissimilarity of the racial stock from that of North America and also from that of Europe. Indeed, he finds that North and South America have only three things in common—republican forms, social equality, and detachment from European politics. And even the republican forms, he finds, have no reality behind them in some of the republics. "Some of them," he says, "are true republics in the European sense, countries in which the constitutional machinery is a reality and not a sham. Others are petty despotisms created and maintained by military force." The situation is viewed with kindly charity and possibly the obvious effort to maintain this point of view is more effective in bringing out the whole picture than any statement of the heavier aspects of the problems of these nations would have been. At any rate Mr. Bryce's book is the best yet available on South America.

Of the religious situation he says little, but what he says is clear:

> In the more advanced parts of South America it [the Church] seems to be regarded merely as a harmless Old World affair which belongs to a past order of things just as much as does the rule of Spain, but which may, so long as it does not interfere with politics, be treated with the respect which its antiquity commands. In both cases the undue stress laid upon the dogmatic side of theology and the formal or external side of worship has resulted in the loss of spiritual influence. In all the Spanish countries, the Church had trodden down the laity and taken freedom and responsibility from them more than befell anywhere else in Christendom, making devotion consist in absolute submission. Thus when at last her sway vanished, her moral influence vanished with it. This absence of a religious foundation for thought and conduct is a grave misfortune for Latin America.

Joyce's *South American Archaeology* is the fullest summary account we have of this little known subject and its detailed account of the scanty material available indicates how imperfect our knowledge is in this department.[5] Mr. Whitney's story of his adventures on the Rio Negro and the Orinoco and other streams is full of entertainment and instruction.[6] Oakenfull's book is a new and enlarged edition of the best manual on Brazil, which has been far behind Argentina and Chile in exploiting its institutions and advancement.[7] M. Garcia-Calderon's studies are worthy of being placed beside Mr. Bryce's. The French President-elect, M. Poincaré, writes in his preface that "here is a book that every Frenchman ought to read and meditate," but it is a book which Americans also ought to read, and which ought to be translated into English for that purpose.[8] M. Garcia-Calderon sees the problems of Latin America to be four: the problem of unity, the problem of race, the political problem, the economic problem. The religious problem which lies back of all of these he deals with superficially. Any solution of the problems of the Latin democracies must cut deeper than this.

It is good to have this new literature growing up. It may be hoped that now at last we shall know as much about Latin America as Germany has long known of Brazil and Great Britain of Argentina and Chile.

The Master Critics

Professor Babbitt, of Harvard, is one of the most unmistakably masculine thinkers we have in this country. Even in an age more vigorous, intellectually, or in a land more given to treating esthetical problems with seriousness and with power, he would impress his public as a critic scarcely less trenchant than he is assured.

[5] *South American Archaeology.* By Thomas A. Joyce. New York: G. P. Putnam's Sons.

[6] *The Flowing Road.* By Caspar Whitney. Philadelphia: J. B. Lippincott Co.

[7] *Brazil in* 1911. By J. C. Oakenfull. Washington: Pan-American Union.

[8] *Les Démocraties Latines de l'Amérique.* Par F. Garcia-Calderon. Paris: E. Flammarion. Three francs 50.

Now, this is saying a great deal, as anyone must realize who read his *Literature and the American College* and *New Laokoon.*

To criticise criticism is "at best a somewhat languid business," it may be; but if we could find space here for a detailed examination of the present volume there would be no such complaint. For the Harvard professor is at his best in discussing a field that he has made his own—modern French criticism.[9]

The French proverb which seems to have been the motto of impressionistic critics (from Renan down, at least) *tout comprendre c'est tout pardonner,* does not recommend itself to this writer. "It is, of course, well, and indeed indispensable," he says, "that the critic should cultivate the Feminine Virtues, but on condition, as Tennyson has put it, that he be man-woman and not woman-man. Thru neglect of this truth criticism has tended in its development during the past century to become first a form of history, and then a form of biography, and finally a form of gossip."

The French have, at any rate, determined the form, and criticism may have been, as Nisard wrote, "the dominating faculty of the nineteenth century." It is to that century, with glances at what went before, and at what M. Lemaître and a few others are doing to-day, that Mr. Babbitt addresses himself. The writers who have chapter-headings here are Madame de Staël and her contemporary, Chateaubriand (not primarily a critic); Joubert, Chateaubriand's counsellor and friend; Chateaubriand's ablest critic, Sainte-Beuve; Scherer; Taine; Brunetière. It is the two chapters on Sainte-Beuve that are the heart of the discussion—in spite of the subtlety and wisdom which distinguish the analysis of Renan; Sainte-Beuve, "from whom we are all sprung," according to Anatole France; Sainte-Beuve, past-master of the relative in the prize century of relativity. Humanist and naturalist, too, this critic; with naturalism the stronger of the opposed forces—tho Professor Babbitt, his discriminating admirer, is the avowed champion of the humanities in an age of chaos. The perusal of this study of modern criticism is tonic indeed; the Harvard man moves with calm self-confidence amid the greatest mysteries of intelligence and spirit. Morality, taste, ideas—these, and not the things too much with us—are the theme; so that the volume is little likely to prove popular. If at times the author seems to be straying rather remotely from his self-imposed task, that is, he explains, appearance only. For "the chief problem of criticism, namely, the search for standards to oppose to individual caprice, is also the chief problem of contemporary thought in general."

> A certain type of seventeenth century critic attempted to establish a standard that was entirely outside the individual. The impressionist has gone to the opposite extreme and set up a standard that is entirely within the individual. The problem is to find some middle ground between Procrustes and Proteus; and this right mean would seem to lie in a standard that is in the individual, and yet is felt by him to transcend his personal self and lay hold of that part of his nature that he possesses in common with other men.

Professor Babbitt's book—like his college lectures, like his conversation—abounds in starting points and suggestions. Some readers, not familiar with academic jargon, will be a little disturbed by the too frequent employment of such phrases as "pseudo-scientific," "pseudo-humanitarian," "pseudo-humanistic," "pseudo-democratic," "belletristic," "romantic dilettante," etc., etc. Tho much interesting material is included, some of it of high actuality, the concluding chapter does not seem to the reviewer worthy of the book—and the writer. But there are the many starting points referred to above—which, if we be not too ignorant or

[9] *The Masters of Modern French Criticism.* By Irving Babbitt. Boston: Houghton Mifflin Co. 8vo. Pp. xiii, 427. $2.50. (The eleven chapters of this work are followed by a bibliographical list of critics, and index of names.)

too indolent, we may carry to our own conclusions. And thus may we fare to a philosophy of letters more or less vague, more or less humane, than that brilliantly proffered by Mr. Irving Babbitt.

O. Henry Unfinished

A finished tale may give a man immortality in the light and literary sense; but an unfinished tale suggests another immortality, more essential and more strange.

This observation of Chesterton's comes to mind when we look over the latest volume of the O. Henry fragments collected by the diligence of his literary executor, Harry Peyton Steger, who himself left his work "unfinished," for just as the present volume was published he died at the age of twenty-nine.[10]

In THE INDEPENDENT of Sept. 5, 1912, Mr. Steger told how his persistent search in Texas was awarded by the discovery of copies of *The Rolling Stone* which the late Sydney Porter published and for the most part composed—in two senses of the word—at Austin in 1894-5. A facsimile of pages from *The Rolling Stone* and "its leading feature, *The Plunkville Patriot,*" were given in the article referred to; and more of them are included in the volume that takes its name from this evanscent periodical, altogether a curious collection of Ohenryana.

These specimens of his earliest work and of his letters are of biographical interest, for they show by what stages his raw and exuberant Western humor was trained into the characteristic style of his later short stories. Kipling struck twelve at twenty-one, but O. Henry was doing his best work at the time of his death, at the age of forty-eight. In fact, the plan for a long story in autobiographical form, which was found in his desk after his death indicated a new and broader development of his genius and enhances the sense of our loss. Three of the short stories contained in this collection were left unfinished, and by reason of that exasperating or enticing to the reader according to his temperament. Since the key to an O. Henry story is hidden in the last paragraph, "The Dream," "The Christmas Tale" and "The Unprofitable Servant" will give his admirers unlimited scope for the exercise of their imaginations and may serve them as a test to see how well they have grasped the psychology of the author.

But, however successful they may think themselves to be in following the thread of his thought, these stories must remain in that library of unmaterialized romances which readers are always striving in vain to enter. This year, the forty-second since Dickens dropped his pen, another volume has appeared professing to solve *The Mystery of Edwin Drood.* Hawthorne took to his grave the key to *Dr. Grimshawe's Secret,* and we have left only few pages of tantalizing notes to assist our surmises. Of Frank Norris's great American trilogy of wheat we have only *The Octopus,* dealing with the producer, and *The Pit,* dealing with the middleman. The third volume to be entitled *The Wolf,* and to show the effects of grain speculation upon the European peasantry dependent upon American field for their food never was and never can be written. There are many claimants to the mantle of O. Henry, some of them very skilful at imitating his style, but at best this is merely following the fashion that has been set by the drug clerk from Texas.

Literary Notes

Erica Clow in *The Honourable Mrs. Garry* (Dutton, $1.35) suggests Becky Sharp in some respects. But while Thackeray had an affection for his creation, Mrs. Henry de la Pasture displays very little. She is woman writing of woman; that is the difference. This novel is called a comedy, but it is cruel comedy. We look forward to Erica's development of character promised in a sequel.

[10] *Rolling Stones.* By O. Henry. Garden City, N. Y.: Doubleday, Page & Co. $1.20.

William R. Jenkins Company, publishers and booksellers of New York, and best known perhaps for their books in foreign languages, are celebrating their fiftieth birthday as a business enterprise.

Three weeks ago we published a note on *The Voice in the Garden,* by Abram Linwood Urban (Philadelphia: Thomas Meehan & Sons). Unfortunately the name of the author of this charming little book was incorrectly stated at that time.

Dr. Henry Van Dyke's *The Unknown Quantity* is a collection of stories of wide range—both locally and in theme. Some of the tales are of the French-Canadian settlers, some are legendary or symbolical. Inside or out, this is a volume pleasing to admirers of the distinguished author's talent. (Scribner; $1.50).

George Barr McCutcheon is to be congratulated on his entrance into the vestibule of art. He has forsaken the pot-boiler long enough to write the novel, *The Hollow of Her Hand.* While there are abundant action and plot, it is delightful character drawing and portrayal of motive and emotion which makes the story a welcome one (Dodd).

Louise Montgomery in *Mrs. Mahoney of the Tenement* (Pilgrim Press) has chosen in her talkative Irishwoman a personal medium of expression neither convincing nor amusing. Here and there in the episodes of humble life of Mrs. Mahoney's neighbors one catches a glimpse of the tragic, but the author has not handled her material with any degree of firmness, and her humor is labored.

A poetic and lovable Greek fruit vendor is the hero of *Mr. Achilles* by Jennette Lee (Dodd, $1). His devotion to the child of a Chicago millionaire enab'es him to save her from a gang of blackmailers and to teach the true meaning of parenthood to her distracted father and mother. It is a book which will appeal to a wide circle of sympathetic readers.

If you want to be intimate with a robin redbreast, all you have to do is to hold yourself very still and feel like a robin. So Mrs. Hodgson Burnett tells us in *My Robin* (Stokes, 50 cents). Her robin was a real one, the very one which appears in her *Secret Garden,* and he did really and truly live in the loveliest rose garden in England, and in the end they loved each other so much that hearts were nearly broken at parting. A delicate story charmingly told.

Horses against the background of the pastures and hunting stretches of Virginia, the fields of England, the race-course of Delhi in India, the African Veldt: such is the theme of *Hoof-Beats,* by Philip Hichborn (Badger, $1). These are healthy and human stories with lots of open air atmosphere, and those who have never heard the cry of "There he goes;" in the hunting field will enjoy them as much as anyone else.

A refreshing book full of good natured humor, and a pleasure to read is *Cap'n Joe's Sister* by Alice Louise Lee (Stokes, $1). The scene is Muskegos Island, and the characters its islanders, principally the Captain of the mail packet, his managing sister, her patient lame lover, and Mrs. Bean, the schoolma'am. It would be unfair to give away the secrets of two love affairs, but they held our attention to the very end.

The White Gauntlet, by Percy James Brebner (Cassell, $1.20), is an historical novel built on conventional lines, a painstaking piece of work lacking in inspiration and freshness, spasmodic in interest, and lacking spontaneity in its dialogue. A country squire, a faithful poet friend, a disdainful lady of the court, a plotting rival, the Duke and Duchess of Marlborough, the days of Queen Anne, a little war, intrigue, intercepted letters, the trick of fence taught by a Frenchman, are the chief and now familiar ingredients.

The Old Loves, by Weymer Mills, is a book fragrant with the spirit of the New York when Jenny Lind sang in Castle Garden, Cortlandt street was a residential quarter, and the stage had its kingdom in the Bowery (Dodd, $1). It concerns the fleeting loves of a boy: his tender love for his mother, his child loves, and those others which intervened before he came into that kingdom over which he was to hold sway for so short a period before his untimely death Delicately written, it atones for the stiltedness of its opening by the grace and ease of later pages.

Old boys and young boys will like *Licky and His Gang* (Houghton, $1). Grace Sartwell Mason knows her boys, and their adventures mischievous and otherwise are told with humor and real affection. One of the best episodes is that in which Hen Higgins is made free of the innermost secrets of circus life and thereby gains admittance to the gang as one of its most desirable members. Any man who feels he is growing old will do well to renew his youth in those inviting pages.

Well Said

Notable Paragraphs from the New Books

Sharing the Glory

At three in the afternoon a simultaneous "Halt!" rang out from the drivers. They had carefully examined their sledge-meters, and they all showed the full distance—our Pole by reckoning. The goal was reached, the journey ended. I cannot say—tho I know it would sound much more effective—that the object of my life was attained. That would be romancing rather too barefacedly. I had better be honest and admit straight out that I have never known any man to be placed in such a diametrically opposite position to the goal of his desires as I was at that moment. The regions around the North Pole—well, yes, the North Pole itself—had attracted me from childhood, and here I was at the South Pole. Can anything more topsy-turvy be imagined?

We reckoned now that we were at the Pole. Of course, every one of us knew that we were not standing on the absolute spot; it would be an impossibility with the time and the instruments at our disposal to ascertain that exact spot. But we were so near it that the few miles which possibly separated us from it could not be of the slightest importance. It was our intention to make a circle round this camp, with a radius of twelve and a half miles (20 kilometers), and to be satisfied with that. After we had halted we collected and congratulated each other. We had good grounds for mutual respect in what had been achieved, and I think that was just the feeling that was exprest in the firm and powerful grasps of the fists that were exchanged.

After this we proceeded to the greatest and most solemn act of the whole journey—the planting of our flag. Pride and affection shone in the five pairs of eyes that gazed upon the flag as it unfurled itself with a sharp crack, and waved over the Pole. I had determined that the act of planting it—the historic event—should be equally divided among us all. It was not for one man to do this; it was for all who had staked their lives in the struggle, and held together through thick and thin. This was the only way in which I could show my gratitude to my comrades in this desolate spot. I could see that they understood and accepted it in the spirit in which it was offered. Five weather-beaten, frost-bitten fists they were that grasped the pole, raised the waving flag in the air, and planted it as the first at the geographical South Pole. "Thus we plant thee, beloved flag, at the South Pole, and give to the plain on which it lies the name of King Haakon VII's Plateau." That moment will certainly be remembered by all of us who stood there.—[From *The South Pole:* An Account of the Norwegian Antarctic Expedition in the "Fram," 1910-1912, by Roald Amundsen. (Lee Keedick), p. 121.]

Morality and Theology

The indignation of Euripides against the gods is not atheism at all; it is revolt against inadequate views of God. The only enemy that a religion or a theology need fear is one in closer touch with truth and morality; and, however vague in a general way the theology of Euripides may have been, it at least set truth and morality in the forefront of everything. To associate God and immorality was to lie; it was better to say God meant morality, even if nothing more was said. "God," said Plato, "should always be represented as he really is."—[From *Virgil,* by T. R. Glover. (Macmillan), p 283.]

Too Many Masterpieces

The true mark of barbarism, according to Goethe, is to have no organ for discerning the excellent. One may show that he lacks this organ just as surely by overpraising as by overblaming. What we see in America today, for instance, is an endless procession of bad or mediocre books, each one saluted on its way to oblivion by epithets that would be deserved only by a masterpiece. We have, in fact, been having so many masterpieces of late that we have almost ceased to have any literature. The critic is anxious like everybody else to show that he is overflowing with the milk of human kindness, that he is, in short, a "beautiful soul." Moreover, in a country where the belief is held that all things will turn out fortunately if only we feel lovely enough about them, it is commercially profitable to have a beautiful soul. The Christian Scientists, indeed, may be said to have the art of feeling lovely on a dividend-paying basis.—[From *Masters of Modern French Criticism,* by Irving Babbitt. Houghton Mifflin.]

A General Election

Upon this helpless populace, gazing at these prodigies and fates, comes round about every five years a thing called a General Election. It is believed by antiquarians to be the remains of some system of self-government, but it consists solely in asking the citizen questions about everything except what he understands. The examination paper of the election generally consists of some such queries a these: "I. Are the green biscuits eaten by the peasants of Eastern Lithuania in your opinion fit for human food? II. Are the religious professions of the President of the Orange Free State hypocritical or sincere? III. Do you think that the savages in Prusso-Portuguese East Bunyipland are as happy and hygienic as the fortunate savages in Franco-British West Bunyipland? IV. Did the lost Latin Charter said to have been exacted from Henry III reserve the right of the Crown to create peers? V. What do you think of what America thinks of what Mr. Roosevelt thinks of what Sir Eldon Gorst thinks of the state of the Nile? VI. Detect some difference between the two persons in frock-coats placed before you at this election."

Now, it was never supposed in any natural theory of self-government that the ordinary man in my neighborhood need answer fantastic questions like these. He is a citizen of South Bucks, not an editor of *Notes and Queries*. He would be, I seriously believe, the best judge of whether farmsteads or factory chimneys should adorn his own sky-line, of whether stupid squires or clever usurers should govern his own village. But these are precisely the things which the oligarchs will not allow him to touch with his finger. Instead, they allow him an Imperial destiny and divine mission to alter, under their guidance, all the things that he knows nothing about. The name of self-government is noisy everywhere; the Thing is throttled. [From *A Miscellany of Men*, by Gilbert Keith Chesterton. (Dodd, Mead), p. 22.]

A Parody on Chesterton

Now, since it is human to err, it is always in reference to those things which rouse in us the most human of all our emotions—I mean the emotion of love—that we conceive the deepest of our errors. Suppose we met Euclid on Westminster Bridge, and he took us aside and confessed to us that whilst he regarded parallelograms and rhomboids with an indifference bordering on contempt, for isosceles triangles he cherished a wild romantic devotion. Suppose he asked us to accompany him to the nearest music-shop and there purchased a guitar in order that he might worthily sing to us the radiant beauty and radiant goodness of isosceles triangles. As men we should, I hope, respect his enthusiasm, and encourage his enthusiasm, and catch his enthusiasm. But as seekers after truth we should be compelled to regard with a dark suspicion, and to check with the most anxious care, every fact that he told us about isosceles triangles. For adoration involves a glorious obliquity of vision. It involves more than that. We do not say of Love that he is short-sighted. We do not say of Love that he is myopic. We do not say of Love that he is astigmatic. We say quite simply, Love is blind. We might go further and say, Love is deaf. That would be a profound and obvious truth. We might go further still and say, Love is dumb. But that would be a profound and obvious lie. For Love is always an extraordinarily fluent talker. Love is a windbag, filled with a gusty wind from Heaven. [From a parody on Chesterton, entitled "Some Damnable Errors about Christmas," by Max Beerbohm in *A Christmas Garland*. (Dutton), p. 51.]

Why Novels Are Written

Novel writing has become a habit. Men used to write novels to amuse their fellow-creatures—to take tired people to the islands of the blest, as one of the finest living hands has put it—but to-day novel writing has become a habit, resorted to for many different reasons. Some men write novels because they have got into a mess with a woman and want to see how it looks on paper, or to explain their real motives, or to find a way out. Other novels are really intimate letters intended for one reader only. Others—and these are largely written by women—create the kind of life which the writer would have lived if she ever had the chance; exercises in what may be called the Consolation School of Fiction. But the greatest number are written because someone else wrote better, and the imitative faculty is so strong within us. [From *London Lavender*, by E. V. Lucas (Macmillan), p. 156.]

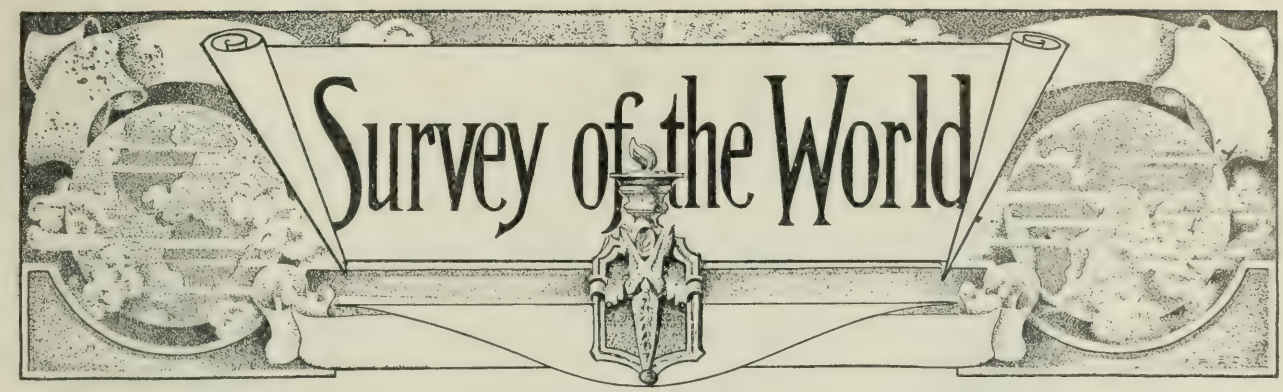
A Modern Heresy

"The great heresy of modern life is the belief that success means the success of the individual. The one thing too commonly assumed is that you cannot expect a man actually to risk his promotion or prosperity out of devotion to a mere ideal."—[From *Sermons in Summer*, by Ralph Birdsall. (Cooperstown: Crist Co.), p. 14.]

A French View of American Newspapers

The American newspapers are an astonishment to a Frenchman. Europe and the world fill so little space there! From time to time a sensational event, which, not being connected with anything else, remains unintelligible to readers. Even information as to domestic politics is in no abundance.

What crowds the newspaper is, first of all, news items of murder, pillage, and accidents. Of this kind of news there is never too much, it would appear. Next come information as to the *outside* of life: comings and goings; court trials of notabilities of every order and all countries; American millionaires; European noblemen; political personages; actors and actresses; singers and dancers. Then there are the interviews that are secured to get their opinions on all kinds of actualities—registering without distinction the most insignificant views and the best balanced *sottises*. Provided that the thing be ticketed with a well-known name, its quality does not matter. Finally, in all the newspapers, the news of sport is most abundant.



The disorder of the composition is remarkable. Pell-mell, news items, interviews, political intelligence succeed one another. The column is divided into two and three stories, and one subject occupies half a column, then twenty lines in the middle or at the bottom of the next column; while the five or six lines which still remain are split in, wherever there is room, in a third. It isn't rare indeed for the same news to be repeated two or three times over. All this suggests a public of indifferent intellectuality, enthusiastic over sport, eager for vulgar emotions and demanding all its daily news the excitement of sensibility which our laboring woman demands of her *feuilleton*;* a public to which serious information can be insinuated only in little doses amid the exploits of burglars, street accidents, and baseball games. But the newspapers portray at the same time the indifferent culture of the journalists themselves in the confusion of their editing and arrangement and in the poverty of anything like reflection upon passing events. . .

The Sunday newspapers are enormous: the *New York Times* offers one hundred big pages. It is enough reading for a week's time for whomsoever wants to read the number from end to end. At first glance this conflicts with the idea that one has received of the public's intellectual level. This public, however, if it is mediocre, is neither illiterate nor frivolous. It loves to read when it has leisure. All the same I should like to know whether the newspaper with its supplements does not drive out the book or limit the book's distribution. . . . Our French newspapers when we compare them with those of the United States are luminous, intelligent, easy and agreeable to read. The matter is distributed, classed, filtered in such wise that nothing halts the reader. At the same time there are more personalities and more ideas. The American press, less literary and less artistic, leaves to its readers a greater liberty of judgment; but I now understand how a man of good sense (the president, I believe, of the Washington Board of Education) could thus define the object of the primary school: to fit the people for reading the newspaper.—[From *Trois mois d'Enseignement aux Etats-Unis*, by Gustave Lanson, Professor of Eloquence at the Sorbonne, Exchange Professor at Columbia University, 1912. Paris: Hachette.]

*A serial story published in the daily newspaper.

The Next Revival

For years the Evangelists of the Church have been telling us that the world is ready for another great revival. They have been prophesying that soon we shall see a "great awakening." But these prophets have seen only a part of the future glory of the Church. In this awakening there will be much of the so-called "evangelistic" preaching, but the greatest emphasis will be placed upon the social Gospel for which the Church has been so much preparing. This Gospel will have to do not so much with a spectacular philanthropy, which is supposed to express the kindness of the well-favored towards the poor, but it will also demand justice and right dealing towards all men. It will deal fearlessly with the question of the exploitation of little children, of helpless women, and of downtrodden men. It will demand that men's bodies shall be saved as well as their souls. It will not say less about heaven and its glory, but it will say more about earth and its duty. It will seek to convert men socially as well as spiritually. It will destroy forever that miserably false conception that a Christian man may practice unchristian principles in his business life simply because his unchristian competitors find it more profitable to do so. It will insist that every community composed of Christian people must also be a Christian community.—[From *American Social and Religious Conditions*, by Charles Stelzle. (Revell), p. 214.]

A Silent Revolution in Japan

The fall of the Japanese Cabinet, and the difficulty and delay in creating a new Cabinet, have aroused a feeling of dissatisfaction and resistance that nearly amounts to a bloodless revolution against the rule of the Elder Statesman, called the Genro. When at the beginning of the reign of the late Emperor New Japan arose, with the later constitution of 1889 based on Western models, those who were leaders in it, Prince Ito and his associates, had a tremendous influence. They were the makers of New Japan. As a body of men they were not recognized in the Constitution, but it came to be the custom, when a Cabinet resigned, for the Emperor to seek the advice of the Genro as to the choice of a Premier. Indeed, if the Cabinet did not please these Elder Statesmen they had influence enough to compel its resignation. One article in the Constitution increased their power. It gave the Emperor the right to issue edicts during the nine months when the Parliament was not in session in case of any special need. In such cases the Cabinet would naturally consult the Genro by whose virtual authority they existed, as the defeat of the Cabinet in the Parliament did not require the selection of a Premier of the other party. But these edicts the Parliament had the right to annul, but it has never ventured to do so. Count Okuma, one of the four surviving members of the Cabinet of 1889, publishes a strong paper of complaint that the Parliament has failed of its duty, and has allowed the Cabinet, under the name of the Emperor, to take advantage of its power to rule too despotically.

The late Cabinet, with Saionji as Premier, resigned because the Secretary of War refused to obey the decision that reductions must be made in every department owing to the dangerous increase of debt. The Secretary of War insisted on four new divisions of the army, and Saionji could not consent; and instead of the Minister of War resigning, the Premier Saionji and Cabinet resigned, under the influence of the four Elder Statesmen.

There was great difficulty in forming a new Cabinet. The Elder Statesmen, Marshal Yamagata, who has been greatly criticized in the Japanese press, Marquis Inoue, Marshal Oyama and Prince Katsura held some ten meetings before they agreed to ask the Emperor to command Prince Katsura for the third time to be Premier. He accepted, but the Minister of the Navy refused to retain his position in the new Cabinet unless he were satisfied that no reduction in the navy estimate were required. It was only the influence of the Elder Statesmen that apparently led Kasura to yield the point to him. But it is believed that the new Cabinet will generally adhere to the demand of the business men that expenses be cut down by $25,000,000 at least. While the Genro have not lost their power, and are still recognized as a cabinet above the Cabinet, yet the popular denunciation of their assumptions, and the recognition that they are a fifth wheel to the government, indicates a progressing silent revolution. The older members have been passing away, and their successors have been appointed by the Emperor, the latest being Marquis Saionji, who has just been added to the four.

A Decent Daily

Does "decent" journalism pay?

This is a query that is not of much interest to newspapermen. Most of them believe that it does not pay, and cannot be made to pay. Therefore it is dismissed without being given serious thought.

By "decent" journalism is meant papers that do not print sensational news simply because it is sensational, that do not emphasize vice and crime, that tell the truth without fear as they see it, that do not color or kill their news to suit their advertisers, that do not print advertisements that they have reason to believe may mislead or defraud their readers—that in every way play fair with their readers.

FILIPINO EDUCATION SHOWN TO BE CREDIT TO THE GOVERNMENT

Exhibition of the Work Being Done in Island Schools Goes to Show the Practical Worth of the Methods Used

HOME SUPPORTED

Revelation Has Been Made to the People of the Resources of Their Own Country, to Replace Foreign Material

WASHINGTON, D. C.—Work done in the Philippine island schools under the direction of the bureau of education in the islands is being exhibited in the northwest gallery of the old building of the National Museum for several weeks.

It was originally prepared for the Lake Mohonk Conference of Friends of the Indian and Dependent Peoples. It is under the charge of George N. Briggs, a member of the Bureau of Education at Manila. Demonstration of the wealth of native material in the Philippines available for industrial use and that the bureau of ecuation is teaching the natives to use their own valuable resources is the main object of the exhibit being. Education in the islands is mainly along practical lines special stress being laid on the native industries and the utilization of native grown materials. New industries are being developed which will make use of raw and hitherto unemployed native raw materials. In the schools with the most practical and suitable objects are made.

Although formerly the natives had several arts and industries of their own, they were not always managed on a practical basis, materials were imported to manufacture articles and textiles which could have been made of local material and supplied, in many cases, far superior to the materials formerly used. Great credit is due the Americans for teaching the Filipinos how to employ

Terms of Balkan Allies Formally Rejected by Spokesman of the Porte

(Copyright by Central News)

RECHID PASHA

TURKISH PROPOSAL HALTS CONFERENCE

(By the United Press)

LONDON—The Balkan and Turkish peace delegates resumed negotiations at St. James palace this morning. Turkey presented her counter proposal and after a session of an hour and a half the conference was adjourned until Monday.

Rechid Tasin, chief of the Turkish plenipotentiaries, presided. The Ottoman envoys formally declined the territorial proposals advanced by the allies and then offered the Porte's counter proposition. The Balkan delegates asked time to consider and the adjournment was ordered.

QUEBEC WILL BUILD 2,000,000 BUSHEL GRANARY

RHODESIAN LEAGUE PRESENTS PLAN FOR A NEW GOVERNMENT

Proposed System Provides for a Crown-Appointed Governor, Nominated Executive Council and Assembly

MANIFESTO ISSUED

(Special to the Monitor)

BULAWAYO, South Africa.—The year 1914 will see the termination of the period of 25 years referred to in clause 28 of the royal charter granted to the British South Africa Company. This clause vests the government of the territories of Rhodesia in the British South Africa company.

The period of time when the company agrees the charter says against the wishes of the natives, a great development of the political constitution of the people. It is felt that a new era has begun and that the government should be as far as possible in the hands of the natives themselves. On the 13th of a meeting of the Rhodesian League held in Bulawayo after much discussion, adopted at a scheme of government which they have now placed before the people through the medium of a manifesto.

Government Planned

The form of government considered by the league as most suitable for the present requirements of Rhodesia is as follows: (a) The executive power must be administered by a governor appointed by the crown and a nominated executive council of not more than six. (b) All legislative power to be vested in a assembly consisting of the executive council and not less than 15 elected members.

In drawing up this scheme of government the Bulawayo meeting fully considered the rights of the chartered companies and even in the certificates they admitted that it would be unjust to ignore the rights which in 1889 they were given by the charter. It was with the full knowledge that their powers of government were not intended to be more than of a temporary nature. This was also provided for by the imperial government in clause 51 of the charter.

ACCESS TO BE GAINED BY AN ELECTRIC ROAD

WASHINGTON—The territory lying between Lower Chase and Great Falls is expected to be made easy of access within a few months by the construction of an electric railway which will run cars through from Great Falls to the Union station in the Washington terminal.

The Washington and Great Falls Railway & Power Company has contracted with the Pittsburgh Construction company for the building of 15 miles of track through this territory, and it is expected that cars will be in operation by the first of July. Three miles have already been constructed and the whole 10 miles will be of standard gauge, with 70 pound rails, with a steel ballast. The power will be transmitted by an overhead trolley of latest and most effective design, fully adapted to high speed, as a cable keeps the trolley wire level.

Not only will this new electric line give easy access to the Maryland side of the Great Falls, but it will open to purchasers of residences a territory so situated in the vicinity of Washington for the building of homes such as exist at Brier Manor, St. Davids overbrook and Wayne near Philadelphia and Essex Fells near New York. These suburban spots are to be closely followed in the development of the land that lies along the new railway. In the last three months more than $300,000 worth of land has been sold and more than $150,000 worth of new houses are in the course of construction.

STAUNTON BEGINS ITS CELEBRATION IN HONOR OF PRESIDENT-ELECT

STAUNTON, Va.—President elect Wilson got an idea of what a reception for him as President will be in store for him and found the streets of this town filled with people the residences and shops gaily decorated and everybody seeming intent on carriage from which to get an unobstructed view of the next chief executive of the nation when he passes in the big parade which is to be a feature of the celebration.

From the moment Governor Wilson passed the line at Alexandria Friday afternoon after he had had his private car of the national capital until 9 o'clock Friday night when he reached Staunton a little per cent hour before the reception given him was one of great enthusiasm. He traveled by troops of cavalry and companies and a torchlight procession in which practically the entire town participated, the Governor and Mrs. Wilson passed through the streets of Staunton to the home of the Rev. Dr. W. S. Fraser, pastor now of the Presbyterian church where the late Joseph R. Wilson father of the President-elect lived in 1846.

BOSTON HELP FOR GRAND TRUNK IS LATEST REPORT

MONTREAL, Que.—That action has been taken between whereby an immediate settlement of the Grand Trunk-New Haven railroad problems will be reached, the Ottawa correspondent of the Montreal Gazette says.

It is declared that Boston financiers have offered to provide the necessary funds whereby the Grand Trunk can complete its program of construction in New England and build independent lines into Boston and Portland.

The report continues that a return for the financial assistance the Grand Trunk will give the Boston financiers on behalf of the New England members of the system.

HARTFORD, Conn.—Both the Connecticut Manufacturers Association and the New Haven chamber of commerce on Monday passed resolutions deploring recent criticism of the management of the New Haven railroad and their belief in the company's general policy of unification of the transportation facilities of New England.

WALKERS HASTEN TO REACH GOAL

PENNSYLVANIA HAS LARGEST STATE ITEM FOR OMNIBUS BILL

PHILADELPHIA.—The largest state item of all in the omnibus public buildings bill when it is reported to the house this session, will be that of Pennsylvania, says the North American in a Washington despatch. The keystone state asks for nearly $6,000,000 for public buildings, swelling a total expenditure of upward of $15,000,000 and bringing to one item the $6,500,000 building asked for Philadelphia to the $5,000,000 asked for the postoffice building at New York.

There are three items for Philadelphia, all asking for federal buildings. The Rayburn bill provides for a building for postoffice, court, internal revenue, immigration, quarts, agency, lighthouse, pension, weather bureau, aeronautical, mining industries, coast survey and other government offices in Philadelphia. The Hamilton Moore bill asks for $1,000,000 or less than the treasury estimate for the proposed new customs house and for

DYNAMITE JURY REPORT AWAITED

INDIANAPOLIS.—While government officials expressed confidence that the jury deliberating on the dynamite conspiracy cases would report to-day or Tuesday for the defense stated that it may require a longer time. There are 54 counts charged against each of the defendants and the jury, if it convicts, may hold on each charge as to each defendant making a total of 1,620 charges that is to be disposed of.

The defendants at 9:30 o'clock this morning attended in the courtroom as they had done twice Friday, when it was first learned, to receive report of the jury's findings.

NEW HAVEN.—In connection with the annual conferences of the Association of American Geographers, the Geological Society of America and the Palæontological Society, being held at Yale

EXPERTS ON HISTORY HEAR MR. ROOSEVELT TALK ON HISTORIANS

Address Before Members of Nine Organizations Marks Close of First Day's Sessions Held in Boston

CONFERENCE ON LAW

Labor Regulation and Efficient Factory Inspection Theme of Many Speakers at Opening Meetings

Conferences this morning of the American Historical Association, before which Theodore Roosevelt, the president, discussed "History as Literature" last evening, mark the second day of the [illegible] convention of nine organizations being held in Boston.

Other meetings today are: The American Economic Association, the American Political Science Association, the American Sociological Society, the American Statistical Association, the American Historical Association, the American Association for Labor Legislation.

The latter organization held two sessions Friday, at which appeals were made for more effective factory inspection and labor laws.

At the morning session the speakers included Prof. Josiah Quincy of the Massachusetts commission on immigration, Henry Sterling of the Massachusetts commission on [illegible] and Professor [illegible] of Harvard university.

Professor [illegible] who read the report of the New York commission, declared nations have [illegible] labor commissions, but [illegible] Britain [illegible] the [illegible] [illegible] [illegible]

The Independent
A Weekly Magazine
Founded in 1848
January 30, 1913
VOLUME 74 NUMBER 3348

Who Are the Most Useful Americans?

If life insurance could really insure against loss of life on whose lives should the American people best afford to pay the highest premiums? In other words, who among our contemporaries are of most value to the community? Whose place would be most difficult to fill? If Congress should decide to award ten prizes to the most deserving men and women in the country and leave the choice to a popular referendum, who should get the largest number of votes?

The question is not an idle one. Even tho it be in the strictest sense unanswerable, the responses may afford some knowledge as to what sort of service is today most highly valued by the American people. It was thought significant of a change in French psychology when four years ago in a newspaper ballot on the question of who was the greatest man France had produced in the nineteenth century (see THE INDEPENDENT, Dec. 7, 1911) Pasteur ran 200,000 votes ahead of Napoleon. But it is more desirable to know who are the greatest in this century than in the past, and however difficult it may be to appraise contemporary genius it is so important to have it done that even the attempt to do it is a beneficial exercise. Mr. Carnegie, in the belief that to discover the exceptional man and set him at his particular task is one of the essentials of progress, has founded an institution to perform that service in the field of science. The president of one of our leading universities has stated that the chief advantage of a college education is the ability to recognize merit and the worth of men.

We Americans are chary of orders insignia and official honors. We have no Kaiser to confer the decoration *Pour le Merite* and, altho several of our fellow-citizens wear the inconspicuously significant bit of red ribbon showing that they belong to the Legion of Honor, they have had to go to France for it. Such semi-official organizations as the National Academy of Sciences with its 120 members and the American Academy of Arts and Letters with its 50 members, cover but limited fields and may not include the most nearly indispensable members of the community.

Galton, in his work on *Hereditary Genius*, has made the estimate that in all history there have been no more than 400 men of extraordinary genius. We have also heard the assertion that if some Herod or infantile disease had killed off in the cradle a dozen picked individuals in each generation the world would have made no progress to this day. In the reaction against this extreme view of the indispensability of the individual, our modern historians are inclined toward the theory that society is constructed like American machinery, that is, with interchangeable parts.

But whichever school we may belong to we must all recognize that certain persons, whether by unique natural endowment, force of circumstances or special training, are enabled to do more for their fellowmen than others can. We may hold for example that mechanics or housewives are the most useful class of people in the community, yet we should have to admit that if any particular mechanic or housewife were to drop out of the ranks another would be found who could fill the place with no appreciable loss to the world at large.

But we do not wish to prejudice our readers by discussing the case in advance, so we submit the question to them without argument. We wish all who read this would take the trouble to send us a list of ten names, the ten living men or women in the United States whom they believe to be doing most for the world in general and their own country in particular. It will add much to the interest if you will state in a few lines what particular achievements or services you have in mind in nominating your candidates for the honor, tho we do not insist upon this. In case the question is put to schools or clubs it will not be necessary to give the names of the individual voters. There is no restriction on profession; statesmen, generals, poets, novelists, preachers, philanthropists, architects, painters, business men, manufactors, inventors, scientists, doctors, labor leaders, reformers, musicians, all these and others are eligible if considered worthy. Future promise or past performance alone should not be regarded as sufficient reasons for choice. That is to say, we do not care to receive the names of those whose career of usefulness has apparently closed with the nineteenth century and who have done nothing noteworthy in the twentieth. Many a fond father believes his young son the greatest genius that America has yet produced and many a poet whose verses are yet unpublished regards himself in the same way, but we should prefer more tangible evidence before counting them in our lists. We want the names of those who have been most socially useful in the recent past and from whom we may reasonably expect similar services in the near future.

Replies should be sent to THE INDEPENDENT before March 1. We offer no prize for the correct answer to our conundrum because we do know what it is.

"Slippery" Diplomacy

The word is not ours—it is Senator Brandegee's, interjected into Senator Root's speech, pleading for a reversal of the action of Congress in violating our treaties with Great Britain; and Senator Root accepted the word as properly describing the cunning dishonor of the act.

It was on Tuesday of last week that Senator Root made his severe and just arraignment of the act he wanted to have repealed or amended. Two days later the reply of Secretary Knox to Earl Grey's protest against the Canal Tolls act and request for arbitration was given for publication. Of Senator Root's stern argument and demand for national honesty we are proud; of Secretary Knox's weak and evasive reply we are ashamed.

Senator Root's argument is complete. We wish every one might read it in the *Congressional Record*. He told how hastily the Canal Tolls bills was past at the tail-end of a weary session. He recalled the fact that the Clayton-Bulwer treaty of 1850 was negotiated at our earnest request, when Great Britain owned the eastern territories of the canal as then projected, and she yielded to us equal rights, with the agreement that neither party should hold any advantage not given to the other and to all the nations of the world.

Then Mr. Root took up the treaty of 1871, which provided for equal rights for the two nations in the use of the canals along the Canadian border—a few years later Canada attempted to give a rebate of nearly

the whole of the tolls to Canadian coastwise shipping on the canals, but President Cleveland protested, and Canada receded from its claim to do precisely what we are doing by the act against which Great Britain now complains.

Then followed the Hay-Pauncefote treaty of 1901, by which Great Britain gave over to us the sole right to construct the Canal, but left in full force the provisions as to absolute equality in its traffic, as given in the earlier treaty, with a fixed pledge of "entire equality, so that there shall be no discrimination against any nation or its subjects, in respect to the conditions or charges of traffic." Mr. Root reminded the Senate that at that time an amendment giving the United States the right "to discriminate in respect of the charges of traffic in favor of vessels of its own citizens engaged in coastwise traffic" was rejected by the Senate.

Mr. Root then took up in a masterly way the claim that because we own the Panama strip five miles each side of the Canal, the Canal belongs to internal commerce, and the treaty is void. He showed by the treaties that we do not hold it as an integral part of the United States, but only in trust for the purposes of the Canal, and that the treaty with Panama reaffirms the promises of equal rights in the treaty of 1901, so that the obligation is strengthened, not weakened.

When Mr. Root proceeds to treat of the claim for free passage for our ships he makes it clear that this is a special privilege which is an injury to other nations. The act relieves our vessels from Portland, Me., to Portland, Ore., from paying toll, on the plea of coastwise traffic. But a Canadian vessel from Halifax to Vancouver is engaged in British coastwise traffic, and has to pay the ton of $1.25 per ton. That is not the equality in trade pledged by treaty. Equally Mexico and Colombia have both Atlantic and Pacific ports and have the right to complain of discrimination against them.

Thus Senator Root elaborates one point after another with absolutely conclusive arguments, and proceeds to show how insincere we would be if we refused to refer the difference to arbitration; and he concludes with an inspiring appeal for honesty and truth: "Have we been insincere?" he asks. "Shall we make ourselves like the man who is known to be false to his agreements, false to his pledged word?" These are strong words. We would not have the name of being a "slippery" nation.

But such is the indictment of the American Congress solemnly made by one of our very wisest. What has Secretary Knox to say in defense?

It is a strange defense. It is no reply to the complaint; it avoids it. In defense of our Congress Mr. Knox says—will it be believed—that no injury has been done, no unfair tolls have yet been paid by British merchants. He might as well have said that the Canal has not yet been dug. Yet he dwells on this claim that because no tolls have been paid as yet there is nothing now to arbitrate! But Congress has passed the act, and President Taft has signed it, and the President has proclaimed what the tolls will be, $1.25 a ton for British and other ships, and free passage for American "coastwise" ships to Oregon or Hawaii, or the Philippines. Must Britain wait till the Canal is open before she can protest against a threatened injustice? Did Mr. Knox never hear of an injunction? The defense is weakness itself, unworthy of a Philadelphia lawyer.

Then Mr. Knox proceeds to say that the remission of tolls to American ships is only a subsidy for which America pays, not Britain, and that the tolls on British ships will not pay expenses, so that there remains a subsidy to British ships also. But that is not the point. It is the complaint of inequality that is made. A British merchant sends thru the Canal a ship of ten thousand tons. He has to pay $12,250 in tolls. An American merchant does the same, and he pays no tolls. When they come

to sell the cargo the American merchant can sell his goods cheaper, because of the discrimination and may drive his competitor out of the market. This threatened and enacted violation of the treaties Mr. Knox does not try to defend; it is indefensible.

We are amazed at the defense; we are ashamed of it. The action of the Senator and House in passing the act of discrimination was dishonorable, was perfidious. It can be excused only on the ground that Congress did not know what it was doing in its hurry. But now it does know. It has been made plain. Congress will be doubly guilty if it does not amend the act. It will be trebly guilty if it refuses arbitration. We are astonished and grieved that President Taft should have signed the bill, but he has in a measure atoned for it by urging Congress to submit to arbitration even if we fear to lose. The law is the chief blot on his administration. The right, manly, decent course is to amend or repeal it; the next best way, not as commendable, but yet passably decent, is to consent to the arbitration asked.

Saving the Arbitration Treaties

There is one statement, in Secretary Knox's reply to Earl Grey's protest against the Canal Tolls Act, which is of momentous importance and which should cause universal rejoicing. The Secretary announces that the United States is prepared to conclude with Great Britain the unratified arbitration treaty of 1911 which the Senate so emasculated last March. As it is inconceivable that the same invitation will not be extended to France, it only remains for these two great powers to accede to our request and then the farthest step ever taken towards the goal of universal peace will have been accomplished.

For these great peace pacts, despite the discreditable amendments of the Senate, far surpass the Root treaties of 1908. Let us state the differences as succinctly as possible.

1st. In the treaty of 1908 disputes of a legal nature or relating to the interpretation of treaties are referred only to the Permanent Court of Arbitration created at the first Hague Conference. Whereas in the present treaty such disputes may be referred to the Permanent Court or to some other arbitral court, specially organized if necessary. Thus all justiciable disputes will eventually go to the Court of Arbitral Justice planned by the Second Hague Conference but not as yet put into operation, for this Court is to be composed of judges by profession, and not mere arbitrators as are the members of the old Hague Court.

2nd. Questions of honor are not excluded from arbitration under the present Knox treaty as they are under the Root treaty.

3rd. Whereas, *all vital* interests are excluded from arbitration under the Root treaty, under the Knox treaty only a few vital interests are excluded—to wit, (a) admission of aliens to the United States, (b) admission of aliens to the educational institutions of the several States, (c) territorial integrity of the several States or the United States, (d) indebtedness or moneyed obligation of any State, (e) Monroe doctrine and other purely governmental policies. But as it has been generally held that most of these questions could not come up for arbitration any way, there seems to be no practical objection to specifying them. The only backward step seems to be in regard to the exclusion from arbitration of questions of "territorial integrity." Still the arbitration of boundary disputes is so well established that failure to include them would scarcely check the practice. Besides, the preamble of the new treaty declares that it is a measure to provide "for the peaceful solution of all questions of difference, etc." This would tend to negative the above exceptions.

4th. The Root treaty expires June 4, 1913; the Knox treaty has no limit.

5th. The Root treaty provides for no Joint High Commission of Inquiry, tho both nations being parties to the Hague Convention of 1907 can,

of course, use the International Commission of Inquiry therein provided. But the recourse to such a Commission is purely voluntary. The Joint High Commission under the new treaty can be brought into play on the request of either party—even against the will of the other and a delay of one year before its findings are made public may be required on the request of either party. Tho The Hague Commission contains only one national of each disputant, and is therefor in that respect superior to the Knox Commission, which may be composed of three nationals on a side, yet under the Knox plan the disputants are at liberty if they prefer to create a commission "otherwise constituted," which means that the Commission might be composed entirely of non-nationals—surely a very marked superiority over The Hague plan.

For these reasons we submit that the new treaties are a notable step in advance and we congratulate President Taft and Secretary Knox on the wise statesmanship which prompts their present action.

College Statistics

Quite too much has been made of the estimates sent out by the Federal Bureau of Education as to the drift of our college boys toward diverse professions. Oberlin has been quoted as one of those whose pupils were turning away from the ministry. As a matter of fact, Oberlin was founded, quite unlike Harvard, for the education of blacks and whites. When the presidency was offered to Asa Mahan, then pastor of a Presbyterian church in Cincinnati, he accepted on the condition that the college should also admit both sexes. From the very outset Oberlin naturally drifted toward producing teachers, and that is her characteristic to-day. Harvard and Yale were founded unquestionably to educate clergymen to supply the increasing demand of the colonies, but there never was an idea that all of her graduates would be needed in that profession. The decrease has not been due to the changed sentiment of our college boys, so much as to the increased demand for educated lawyers and business men. Thirty-seven representative colleges show that teaching is now the dominant profession of graduates, with 25 per cent, while business takes 20 per cent, law 15 per cent, medicine 7 per cent and the physical sciences applied to everyday life, including farming, take up 4 or 5 per cent. Farming would count much more heavily only that our agricultural colleges and schools are creeping up to take charge of two or three thousand in every State. It is impossible to draw any conclusion as to religious decadence, or otherwise, from these statistics. It must be specially noted that our teaching profession is steadily becoming more ethical in its nature and covering a set of problems that can hardly be counted otherwise than as religious.

The Trust Problem

Public attention was drawn to the Trust problem last week by the seven bills introduced in the New Jersey Legislature at the suggestion of Governor Woodrow Wilson, and by the testimony of William E. Corey in the Government's suit for the dissolution of the United States Steel Corporation. New Jersey has been called the home or the mother of Trusts. Her laws, as the Governor said in his message, do not check monopoly, but "actually encourage it." They were enacted in order that combinations desiring incorporation with broad powers might be attracted to the State, and that the State might enjoy the fees and taxes which would follow. And so it has come about that almost all of the great combinations are chartered in New Jersey. That is to say, the holding companies have been incorporated there. The long list includes the Standard Oil, American Sugar, American Tobacco, International Harvester, International Mercantile Marine, United States Rubber, American Woolen, National Lead, American Smelting, Distilling,

and Cotton Oil companies, the Steel Corporation, and many others. The capital stock of the State's corporations is nearly $8,000,000,000, and the tax collected last year was $2,691,891. If Governor Wilson's bills become laws, the statutes of New Jersey will no longer be attractive to Trust-makers.

These bills were written, at his request, by the head of the State's highest court and by a former Justice of that court. They carefully define Trusts, specifying the acts which are to be unlawful; forbid issues of stock except for value received; forbid the organization of corporations to promote restraint of trade or monopoly; exclude holding companies, and condemn such local discrimination in prices as is designed to ruin competitors. The fixing of prices and restriction of output by agreement are, of course, made unlawful. And the officers and directors are to be held responsible. Violation of the law is to be a misdemeanor, punishable by fine or imprisonment, or by both. But the statutes are not to be retroactive. The great companies may retain their present holdings.

These bills indicate the attitude of the President-elect toward the question to which they relate. There can no longer be any doubt as to his views concerning Trust legislation, State or Federal. It will be observed that the provisions of the bills are in accord with the recommendations of the radical members of the Stanley committee and with the essential parts of the bills introduced some time ago by Representative Stanley. They are also in accord with the Democratic national platform, which, after calling for a "vigorous enforcement of the criminal law against Trust officials," says:

> We favor the declaration by law of the conditions upon which corporations shall be permitted to engage in interstate trade, including, among others, the prevention of holding companies, of interlocking directors, of stock watering, and of discrimination in price.

New Jersey's corporation laws have given the State a bad name. They should be thoroly revised. The Governor's bills represent the policy of a great majority of his party, and the purpose of them is to serve the public interest. Those who prefer regulation of great incorporated combinations to the suppression or disintegration of them will hold that the bills go too far. But they fairly represent the views of a large majority of the people.

Mr. Corey's testimony tends to confirm those views. The Steel Corporation has been conducted with a greater measure of publicity than any other great company has permitted. Its policy has not involved attack upon smaller competitors by means of price discrimination or otherwise. Mr. Corey was president of the Corporation for several years. We now know, from his testimony, that the company has virtually been in combination with those other companies by means of agreements that fixed prices; that there has been an armor pool, including foreign as well as domestic manufacturers; that there was a structural pool; that the plate trade was controlled by a pool, and that in addition to a domestic rail pool (which for years has made the price of railroad rails $28 a ton, at the mill), there has been an international rail agreement, governing prices to some extent and apportioning territory. We now know that the domestic agreements were made at the dinners which were attended by representatives of the Corporation and of the so-called independent companies. Under the rail agreements American rails have been sold for export at prices far below those which American buyers were required to pay, and the exaction of these domestic prices was facilitated by interlocking directorates. We mean that certain capitalists and financiers have been influential both in the purchasing railroad companies and in the rail-making corporations. But that part of the exacted domestic price which was excessive was eventually paid by the American

people, and they do not like to think of it. Nor do they relish the sales at low prices abroad, an unjust discrimination against themselves, by manufacturers whose success they had promoted by protective tariff duties.

This testimony given by Ex-President Corey tends not only to support the prosecution, but also to promote the enactment of drastic anti-Trust laws at Washington, in New Jersey and in other States. It gives aid to those who would suppress or disintegrate rather than to those who would have great corporations subjected to strict regulation by a strong Federal Commission. The Republican and the Progressive parties in their platforms called for such a commission. Control of great industries by means of such agreements as have existed in the steel trade, with the exaction of unjust prices, should be prevented. Experience does not prove, however, that the public interest is served by such dissolutions as have recently been ordered by the courts. We have thought that the subject ought to be considered by an eminent commission of inquiry, and that such a commission should study the treatment of the problem in other countries. We are confident that a commission of inquiry would recommend the creation of a Federal executive commission, empowered to supervise and regulate the conduct of great industrial companies. We should like to see regulation tested.

A Martyr of Science

Physicians are, by the very nature of their profession, liable to become martyrs to it. Such a living martyr received the honor of knighthood lately from King George. Dr. George Turner was in the medical service of the government of South Africa when the rinderpest broke out, and Dr. Koch was called from Germany to find a curative serum. He was successful, and after he left Dr. Turner was given charge of the work and succeeded in stamping out the disease which was destroying the herds of cattle. Then he retook charge of the hospitals for the reduction of deaths by typhoid fever with great success. Then he gave all his energy and time to the care of the lepers, visiting them daily and studying to find a cure until he was retired for age. But still this was his great task, until one day he discovered the marks of leprosy on his own left hand. Then he withdrew to seclusion, still pursuing his study of the disease which has now rendered the arm useless.

His meager pension is all his support, but King George hearing the story made him Sir George Turner, somewhat as the Church of Rome makes a saint of Father Damien, who cared for the lepers of Hawaii. We observe the record of two other Catholic priests who died last year of leprosy contracted from those they served, and there has been no lack of Moravian and other Protestant martyrs to the same cause. The case of Sir George Turner differs from theirs only in that he was a recognized authority on the treatment and possible cures of this inscrutable disease to which he is a medical martyr.

The Turkish Indecision

For a day or two the world rejoiced that the bloody Balkan war was over, and European Turkey was relieved of six centuries of Ottoman oppression. The allies had stood firm and stern, demanding the whole of the Turkish realm in Europe except a few square miles before Constantinople. They must and would have Adrianople and Scutari and Janina which had not yet surrendered, or they would press on and take Constantinople. Turkey knew she must submit, but she refused to yield, or made the feint of refusing, waiting until the united powers of Europe should give the command that must be obeyed. It came and then she yielded, and all the world rejoiced.

But that was not the end. Just as in old Rome a general with the Pretorian guards at his command could depose an emperor and take his throne till succeeded by the next

usurper, so Enver Bey called at the Porte and bade Kiamil and his cabinet resign, and then took his place, telling the silly rabble that the new government would fight sooner than consent to the cession of Adrianople. So the pot was again in the fire, and the courts of Europe were startled and angry, and the representatives of the allies in London were ready to dissolve the council and renew the war.

But can they do it? Will the European powers allow it? They can prevent it, and the allies know it, if Turkey does not. The allies, or some of them—Russia for example—do not want the allies to take Constantinople. In the communications of the Powers Russia gave an ominous warning and threat to Turkey, to the effect that she might send a force into Turkish territory. That might mean an army to help the allies take Constantinople, so that she might have a claim to hold that ancient capital, as she has long wished to do, and might have done in her own war against Turkey if the powers of Europe had not forbidden it. Or Russia might think this a good chance to take possession of the coveted eastern provinces of Asia Minor, which she feels is her right to take at the proper time in payment of the old war debt. While it might be natural to wish that the allies might finish their task by taking Constantinople and driving the Turk utterly out of Europe, it is yet likely, and yet to be hoped, that the new and boastful cabinet may see itself compelled to submit, like that of Kiamil, so that this bloody war may cease. It will take many years to recover from the fearful loss of life and wealth, and many widows and children must suffer, and many maids remain unwed, for such is the bitter harvest of successful war—much more of disastrous defeat.

Our Saint Helena

Pure, simple goodness gets its honors as well as deserves them. The whole country is warmly interested in the marriage of Helen Gould, and the papers have given pages to the account of it. It is not because she is rich, but because her goodness has gilded the gold of her wealth. She inherited millions; and while others made a show of their fortunes and indulged themselves in their pleasures, she resolved as a young woman to devote herself to making people better and happier, particularly soldiers and sailors and the employes of railroads even other than those in which her wealth was invested.

It will be hard to speak of her hereafter by any other name than that by which she has been known. The name of the Emperor of Japan is changed after his death, Mutsutito to Meiji, as if he had been canonized; but to the common memory of men our saint will still remain plain, good Helen Gould; quiet, retiring, beneficent Helen Gould; devoted to self-forgetful good works. She has married, and we are glad of it; it proves her human yet, one of us, good to be sure, but not too good for human nature's daily food. Many thousands of working men have been glad to offer their strictly limited contributions to be gathered into modest gifts of homage for her wedding, and we are sure she will prize them more than the diamonds and pearls of her millionaire friends.

Tillman and Blease

For once we are with Senator Tillman in his attack on Governor Blease, of South Carolina. What we have against Governor Blease is his defense of lynching, and his later threat in a message to the legislature of murder against editors who criticise him, particularly directed against Mr. Gonzales, editor of the Columbia *State*, whose brother was murdered by a nephew of Senator Tillman for editorial comments which the nephew did not like. Governor Blease goes so far as to remind Editor Gonzales that his brother's murderer was acquitted. If a man so vilified "defends his honor with blood," asks the Gover-

nor, "who will blame him?" If some restriction is not placed on these journals, he says, some newspaper man is likely to be killed and "upon your heads will be the blood of that man," that is, on the heads of legislators who did not muzzle the press. This adds another justifiable cause for murder to those mentioned by our Texas correspondent, who would give liberty to kill a man who had injured a woman of his family or had given harbor to the injurer, and to one who robbed a man of his property, leaving him helpless. We presume that other proper occasions for murder will be added.

Governor Blease, who was inaugurated for a second term last Monday after a whirlwind campaign, is bitterly attacked by Senator Tillman in a letter addressed to the South Carolina legislature, which calls the Governor a "demagog" and a "low type of man," who has the gift of "bamboozling" the honest and innocent citizens, precisely the way, we well remember, that Tillman himself was described in the Columbia *State* and the Charleston *News and Courier*, when he was running for Governor. Our readers will not forget that Governor Blease at the meeting of the Governors in Richmond in connection with his speeches defending lynch law, boasted that the people would elect him Senator. The popular primary is not unlikely to elect him, as he has much of that art of rousing the masses which Mr. Tillman had in his younger days. Senator Tillman's experience at Washington has not a little tamed him, and Governor Blease has picked up his pitchfork.

Oklahoma in the Cabinet

The papers which have much to say of Mr. Wilson's prospective Cabinet have very little to say of the fact that both houses of the Oklahoma legislature have past a resolution asking Mr. Wilson to give the post of Secretary of the Interior to Mr. Robert A. Rogers, of Oklahoma City, and that Senator Owen of Oklahoma has endorsed the request.

Those who read the article in THE INDEPENDENT of January 2 by Mr. Grant Foreman on the manner in which the Indians of the former Indian Territory now incorporated in Oklahoma, are being crowded out of their holdings given them by the Dawes Commission, and on the efforts to remove what protection was then promised them, will understand the meaning of this effort to put in control of the Department of the Interior, under which is the Indian Bureau, a man who will be pledged to get for the white people what they want. In fact, it has been urged by the Oklahoma press ever since the election of Mr. Wilson, that every effort should be made to have the Secretary of the Interior selected from the State of Oklahoma, because of the many intricate questions arising in that State which must be worked out thru the Interior Department.

It must be plain that the interests of the Indians can best be conserved by officials who are in no way biased by the tremendous pressure of the interests of the white people of the State. A man selected by the white people would assume his office with a handicap that would not permit justice to the Indians. The fact that he is selected and endorsed by the Oklahoma legislature ought to be the very reason why he should not be appointed.

The fact that the Senators of half a dozen mountain States have united in a combination to secure a far-Western man for that Secretaryship may well lead friends of the conservation policy as to national control of public parks to see to it that the new administration does not turn them over to State control. They belong to the whole country.

In Brief

The military men demand that the entire Canal Zone, ten miles wide, be excluded from residence and cultivation and left to jungle, so as to prevent sudden sorties by an enemy in time of war. What a pity! Can it be necessary?

We are waiting to see if the Pennsylvania Legislature will revoke the charter of

Coatesville, the town which burnt a man alive, and whose citizens acquit all tried for the murder. The very suggestion by the Governor is a lasting brand.

We fail to see why rosaries and scapulars should have been taken away from a number of the convicted dynamiters when searched at Fort Leavenworth and put in prison clothes. They are not dangerous, and might be very properly helpful to character and discipline.

We like Mr. Wilson's promise that when President he will look up the conditions of the government of the District of Columbia. If half of what Mr. McKelway said at a conference last Sunday is true, the District is run in the interest of land speculation, and this under the very eyes of Congress.

In one respect Korea has much the advantage of us. The written language is extremely simple. Four hundred and sixty years ago the Minister of Ceremonies was chairman of a committee that formed the native script, and he said, "A person of intelligence can learn it in a morning, and the stupidest person in a few days."

Professor Patten, of the University of Pennsylvania, writes us that the opinions attributed to him about economy in an editorial of January 2 were based on false printed reports. He says:

> I have never made any such statements as you attribute to me, and have on every possible occasion denied doing so. The whole affair was manufactured in a newspaper office that did not even have a reporter at the church when I was speaking.

We greatly regret having been thus mislead.

We have been glad to be able to confirm the statement lately made by Cardinal Farley that he has found in traveling thru the country very little bigotry against the Catholic Church. We believe that there is no great amount of bigotry of Catholics against Protestants, and yet we have been requested to copy from the *Western Catholic* this oath of the profession of faith which a convert is required to take:

> With a sincere heart, therefore, and with unfeigned faith, I *detest* and abjure every error, heresy and *sect*, opposed to the said Holy Catholic and Apostolic Roman Church. So help me God, and these His holy gospels, which I touch with my hand.

The Speaker of the British House of Commons was right in deciding that the introduction into the Suffrage bill of votes for women, so changed the nature of the bill that it would have to be withdrawn. If this should defeat the Ministry it would be most unfortunate, for it would compel a new election and delay home rule for Ireland and Welsh disestablishment. And it is the women who have done it. Perhaps too much was attempted by this Parliament.

Let it be noted that in honest deference to the popular will, and in defiance of their own political prejudice, the Oregon legislature, which has a large Republican majority, elected as United States Senator Harry Law, Democrat, who had received the largest popular vote in the primary election in November. Thus the legislature, like the Presidential electors, becomes a mere registering body.

An evidence of the peaceful condition in China appears in the convention held last month in Peking of the Young Men's Christian Association, when 450 delegates were present from 14 different provinces. President Yuan Shih-kai gave them a formal reception, the first of its kind, and addressed them most appreciatively, praising their work, and they responded with cheers and wishing the Republic "ten thousand times ten thousand" years of peace and prosperity.

In an address before the New York Peace Society last Friday night, ex-President Eliot, who has recently returned from a trip around the world, stated that the Eastern nations have not yet learned the meaning of "brotherhood," and with the exception of Japan do not know how to arrive at truth by induction. These were the only fundamental inferiorities he found in the East. He also showed that Japan had nothing possibly to gain and everything to lose by a war with any European nation, or with us. All of which sounds sensible.

A physician of eminence, who is also a Latinist, objects to our use of the word *vaccination* when he thinks we should have used *inoculation*. We do not accept the correction. The derivation of the former word from the *cow* is now quite forgotten in its use in all languages. *Inoculation* is now used to mean the transmission of a disease, while *vaccination* has come to mean the transmission of a milder form of a disease to protect against the virulent form. The *Bacterial Therapist* calls itself "a journal of *vaccine* therapy," and in its November number it uses *vaccines* ten times in its tables of contents.

The Great Catastrophe of 1913

Related Several Years After the Events Described

By Charles M. Sheldon, D.D.

Author of In His Steps, Lend a Hand, The Miracle at Markham, Etc.

The world will never forget the great catastrophe of 1913. By the side of it, the losses by fire, earthquake, plague, and battle in all the centuries fade into mere incidents. The recovery from this overwhelming disaster took years of patient and painful labor, but perhaps the lessons it taught will be worth all the tragedy that is now passed into the world's greatest chapter of loss.

It began in an absolutely obscure and unknown man who was shoveling coal into a furnace which supplied power for a machine shop in New York.

The man complained, one night after work, of a strange feeling in his hands. It was not pain nor numbness, but an inability to open and shut his fingers. When he went to his place of work the next morning he found that he could not pick up his shovel. He was promptly discharged and another man was doing his work before he was out of the shop.

The man afflicted with this trouble went home and told his wife. She could not see any signs of trouble and scolded him for being lazy. But before night she herself was complaining of the same inability to open and shut her fingers or use her hands in housework. These people were too poor to hire a servant and the wife did all the work of cooking, washing, and general house labor.

Both the man and his wife began to be frightened and before dark they visited an infirmary which was a part of a social settlement in the neighborhood.

When they explained their condition the young physician in charge treated it as a case of temporary muscular paralysis, gave them a prescription and sent them away.

But the strange inability to use the hands continued and the man and his wife came back to the infirmary the next morning. To their surprise, which had in it a vague but deepening sense of terror, a line of men and women was formed at the infirmary all complaining of the same strange inability to use the hands.

As the man and his wife stood waiting in the line they compared notes with those in front and behind. In every case the symptoms were identical. There was no numbness and no pain. Every other faculty of mind and body was sound. Only the hands had ceased from their functions. They were as absolutely useless as if they had been cut off.

When the furnace stoker and his wife reached the doctor's room, after waiting in line several hours, they found, not the young physician who had prescribed for them the night before, but a room full of the greatest doctors of New York.

It would have been ludicrous, if after events had not resulted in such supreme disaster, to note the baffled faces and hear the excited dialog of these famous physicians and surgeons. An absolutely new disease had broken into the world's catalog within twenty-four hours. There was literally no parallel to it in all the history of disease. It baffled all diagnosis and was apparently beyond all reach of cure. And all the cases were exactly similar. There had been no paralysis, no stroke. There was no lesion of any other organ. All other faculties were intact. Perfectly rugged working men in the line that continued to lengthen out every hour with portentous rapidity, gave the same testimony in reply to rapid fire questions. Each reported a perfect absence of pain or discomfort. Every part of the body was doing its normal work, except the hands. They had absolutely suspended their accus-

tomed labor. The fingers refused to hold tools. The hands were dead to the common work of the hand.

Twenty-four hours went by, and the third day after the furnace man had found himself unable to pick up his shovel all the New York papers were giving whole pages to accounts of the new and astounding disease, if disease was the right word to use. Every paper in the city was hysterical over it. For once every daily was characterized as a red-ink shriek of mingled sensationalism and terror and anger combined. Even the New York ———— contained a front page editorial in letters an inch long demanding that Congress suspend all other business and that the powers of the entire nation be centered upon some solution for what promised to be, if something did not stop it, the greatest human tragedy since the world began.

And indeed the editorial spoke even more prophetically than the gifted editor could possibly imagine. At the end of another twenty-four hours all the people of New York suddenly realized with a shock that was stupendous, the catastrophe that had fallen like a lightening stroke on civilization.

In the first place, not a single daily paper in the city was fully printed. The *Times* appeared with four pages, and not a line of foreign news. The *Tribune* had an issue of three pages and a half. Subscribers who secured copies looked in dazed wonder at the blank spaces. The *Sun* had started with an issue that looked like a cheap weekly, but the net result was two pages of printed matter, nearly every line of it a hysterical account of the catastrophe.

But the papers were only an item that third day of the hand failure. The civilization of ages was beginning to come to a standstill. Before night of that day not a wheel was turning on the elevated, in the subway or on the surface railroads. Not an elevator was running, except with rare exception, in any of the skyscrapers or hotels. Ocean steamers lay still at the docks. Others that had been overdue could be seen tossing curiously about all over the harbor. The ferryboats were either still in their slips, or floating helpless on the river. Automobiles and carriages presented the same curious picture in Broadway and thruout all the streets. Some were standing perfectly still across car tracks. Others were being driven by men who bore on their faces marks of a white terror that before the week was over was the most vivid thing that stood out clear to the bewildered consciousness of the multitude.

For when the next twenty-four hours had passed, men and women of all ranks of life realized that the common, dirty, human hand of everyday toil had ceased to do its work.

Weeks after, when the regular work of the world had been resumed, certain facts were made clear, among them the following:

The strange disease for which no name was ever found, affected only the hands of men and women who were engaged in what may roughly be called common labor, i. e., labor for which days wages is paid, or labor which was daily handling tools. It may interest our readers who have only heard of the great catastrophe to see a list of those who were afflicted. It must be remembered that the disease did not impair any other faculty or organ of the body. These were not hospital cases. The hands simply ceased work. They could no longer hold tools or do the common task required of the hand.

The people generally affected all over the world were:

Stokers; servants in hotels and private houses; railroad firemen and furnace men; farmers; elevator men; men in machine shops; newspaper men in the machinery part of the press work; cooks and their helpers; drivers of trucks, carriages and automobiles; servant men and women in every department of labor; men engaged in sewer and street construction; carpenters and sailors; firemen; garbage handlers; and in general all

men and women whose living was made by doing the dirty, dangerous or common work of the world which simply calls for *physical* labor and the hourly use of the human hand.

It was noted afterwards that men and women who lived without using their hands as the first means of a living were exempt from the strange disease.

Ministers, newspaper editors, authors, poets, singers, lawyers, business men, financiers, magnates, Wall Street brokers, speculators, politicians, actors, and society leaders were immune.

But before another twenty-four hours of that eventful week the most astonishing sights were witnessed in New York and all over the world.

The rich people in the big houses on Fifth avenue were trying to cook their own meals and make their own beds and scrub their own floors. Libraries of interesting books could be written about their tragic attempts to take care of their own bodies. Not a servant could be found who could use his hands to cook, drive, dress or care for these people. Men who had not blacked their own boots for years at first made the attempt, but before the week was over the tragedy about them made them forget and ignore all such superfluities of living. For New York was dropping down into literal ruin. There was no one any longer to run the machinery that brought light, heat, or power to the city. No one left to provide for the carrying off of garbage, sewage, or filth. No women to be found to scrub the floors of hotels at night. The churches were closed. The great hotels contained dazed, jostling, half-insane richly dressed millionaires who were going mad for common bread, which could not be bought for any price.

The money kings of Broadway and the Stock Exchange members, presidents of banks, financiers held a great meeting out of doors in Central Park.

They were absolutely powerless to suggest a single remedy for the tragedy. The value of money was absolutely nil. One of the richest men in New York offered $100,000,000 for a cook to come to his house and start a fire in a little coal stove and bake a loaf of bread. The richest man offered to do it for $200,000,000 if the other would make five cents worth of fresh yeast, and the man was unable to find a single human hand in New York that was able to bring together the materials for such a ferment.

This was at the close of the fifth day, when New York began to be aware that it was starving to death.

Food, fresh food, of any sort was not to be obtained at any price. Those human hands that ordinarily worked so incessantly and unknown to bring food, luxuries to the leisure and the pampered and the idle class, and common food to the poor as well, food, of any sort, was not to be had.

Civilization was dying. And all on account of a failure on the part of common human hands to open and shut their fingers and handle tools of labor and bear back and forth burdens. And there was no plague. No pestilence. No famine. No war. The men and women affected, for the most part plain, common, unknown people, were not suffering any pain and were not in need of hospital attendance. They walked the streets with the rest of the multitudes that swarmed there, driven from their homes for lack of light and heat and comfort, out of houses and hotels that were with bewildering rapidity becoming uninhabitable on account of absolute neglect, the neglect that followed the inability of the common hand to do its common work.

The detailed history of that astounding world experience can never be told by a world of historians. The experiences were so unique, they were so completely without a parallel, they culminated in one overwhelming disaster after another so rapidly that no historian or group of historians could compile any real story of what actually occurred.

Men and women who had never before used their hands in manual labor

began to take up unaccustomed tasks in the terror and necessity of simply holding off Death a little longer. The rich and cultured, the prima donna and the doctor of divinity, the college president and the delicate lady of fashion, caught up tools, shoveled coal, prepared food, tried to run engines and elevators and put in motion the complex wheels of modern civilized movement. It would have been laughable if all their efforts had not been surrounded with deepest tragedy to see the human hand so awkwardly trying to adjust itself to the task of keeping the world from falling to pieces, that world which the people were learning so fast was not dependent on their money or learning, or culture, or news, or art, or music, but simply on the going to work every day of multitudes of coarse, common, for the most part grimy hands of coarse, grimy men and women.

But among the multitude of facts noted during the attempts of unskilled and untaught hands to do the world's work was this one: as soon as such hands had begun to acquire any skill in the task the same inability to use them became apparent. The owner of those hands had joined the ranks of common toil. He was a victim with his fellows.

And so as the hours of the world were multiplied the world rolled on to extinction. Civilization stood still. The cities were filled with bewildered masses. All rank was obliterated. Afterwards men recalled how quiet the streets were. And many other incidents were recalled, to show how leveling the process of hand loss had reduced all mankind.

On the morning of the seventh day of this memorable week, the man who, as far as any reliable history can show, was the first in New York to complain of the loss of his hand power suddenly exclaimed to his wife: "I believe I can use one of my hands!"

He held it up and looked at it with fascination. In the days of his honest toil he could not have looked with more exquisite delight on a bag of gold held up before his eyes as a gift.

His wife repeated his exclamation for herself. The week's horrors had brought them both to the verge of death. One hand good! Thank God! By night the man and his wife went singing for joy thru the streets, and as if with one tongue their shout was echoed by the world's millions, for at the same instant all human hands of honest toil were released, and with a universal cry of thanksgiving the world leaped to work again.

How long, did you say? Just one week! One short week of the world's civilization, the scarred, roughed, coarse, wrinkled, hard, broken nailed, dirty hands of the world's unknown and often despised hands held no tools, performed no day's work. And, O, for the losses, the frightful ruins, the desolation and world-wide tragedy of that short week!

But what a lesson for the world! O God, our Father, help us not to forget it! O help us, of this money-loving, ease-loving generation never to forget what we owe to the men and women who work with their hands for us, to keep our homes going, to roll the wheels of our civilization forward, to make possible our churches and our schools and our cities and our very life. O Thou who didst work for some great reason eighteen years in a shop and only two or three out in the world, help us to think with deep kindness of all men and women who toil with the hand. And if we ourselves have to make our daily bread by the opening and shutting of our fingers around some tool of labor, O, we beseech Thee, give us a God-vision of our kingly task and support us thru the day's commonplace drudgery with the inspiring truth that we are needed to keep the world alive, and make our hands to do honest toil today in the name of Him who made tables and stools and common things for the people of Nazareth. And may every man and woman in all the world learn how to do some needful and honest work with his hands. Amen.

Topeka, Kan.

Women Who Will Help Men

The Meaning and Promise of the Feminist Movement

By Beatrice Harraden

Author of Ships That Pass in the Night, Out of the Wreck I Rise, Etc.

I have never quite known the exact meaning of the word "feminist," but if it means someone who, without being in the least hostile to men, believes in her own sex, is proud of it, and claims for it equal opportunities with men in all walks of life and endeavor, equal freedom, equal justice, equal fair play, and equal pay for equal work honestly accomplished, and, of course, equal citizenship, then I am proud to say that I was born a "feminist" and still prouder to record that I was brought up in circumstances that fostered feminism. For I had the immense joy and advantage of owning a father who, as a matter of course, and without even discussing the matter, took it for granted that his girls and boys should have equal chances in life, equal help and equal indulgence.

Looking back now I realize with wonder how greatly in advance of his time he was, inasmuch as he was conscious of holding no views on the subject, and certainly used no grand sounding words, but simply went straight ahead and acted. Surely the finest gospel that could be preached on behalf of any cause is the gospel of deeds, not words.

But if I had never been a feminist before I should certainly become one now. The most superficial thinkers must see for themselves that we are up against new problems and confronted with new and ever-changing possibilities in the economic and industrial arena.

Whether men like it or not, whether women, themselves, like it or not, the fact stands staring us in the face that women of all classes are being drawn more and more every day into the labor market, and in these circumstances it is an injustice, as well as a cruelty that they should be allowed to suffer under any disadvantages and disabilities which would hamper their progress or handicap their efforts in the fierce competition and struggle of modern life.

They need, too, and will, of course, need increasingly, that their manifest capabilities should be granted an ever-widening scope for expression, and their natures a true and not a fictitious freedom for development on their own lines, as independent human beings.

The Woman Movement, especially during the last six or seven years, shows us clearly of what the ordinary woman is capable. Nothing in the whole history of the agitation has been so delightful and interesting as to watch the quick growth and evolution of the average woman who has had no special upbringing and who has not been born and bred in an atmosphere which would naturally foster such a development.

Sometimes, to be quite candid, I have felt my whole pride of judgment upset by a sudden revelation that a woman whom I have been accustomed to look upon as rather silly and idle, possesses, without doubt, some definite, practical quality hitherto unguessed at even by herself, some splendid gift of initiative, and some valuable power of organization and administration waiting to be used for the benefit of the community, the State and the Empire. When you add to this her contribution of courage for the sake of an ideal, her persistence, self-reliance, daring, self-sacrifice, indifference to scorn and ridicule, and utter disregard of personal suffering, both physical and mental, you have before you for contemplation a picture which has never before been invested in any movement.

Psychologists may well rub their

eyes and exclaim, "Hullo, what's this? This really means something. This is what really counts." It does count. It means that feminism is not going to be confined to a small class of exceptional people, but is destined to wind its way like a strong, beneficent river watering the dry and arid places of the world.

Beneficent? Yes, that's the word, and here is the most characteristic reason why one should be a feminist. For by means of these very abilities, the free exercise of which is claimed by feminism as an individual and egoistic right, there is important altruistic work waiting to be done, which women care passionately to push to successful issue. I mean all matters touching upon the care and concern of children: honest legislation for abolishing the White Slave traffic and combating the social evil: and pressing social and economic reforms, some of which will make it permanently impossible, for instance, that fifty thousand sweated women should be working fifteen hours a day at the rate of a few pennies an hour.

Why should men fear the march of feminism? Is it just the fear of the abstract unknown? Well, a few sacrifices and a few readjustments on their part and they are gainers rather than losers in the new relationship between the sexes.

To take one single example, which nevertheless includes a whole list of helpful possibilities: the modern woman has learnt, and is learning, from her own experience, something of the strain and stress of outside life which men bear so uncomplainingly. She realizes increasingly the difficulties and the fret and friction of the daily routine in the office. She exacts less, demands less from her breadwinner, because she understands more.

I have great sympathy with that breadwinner, and feel that this must indeed be a difficult time for him if he is not in harmony with the Woman Movement. At any moment the very quietest female member of his family may give him such a shock and surprise that no wonder, indeed, if he believe the foundations of his home are in unsafe condition.

Sometimes, when going to the city rather early, I sit opposite to him in the tube, I long to reassure him that all is well in his home, that all will come out right, that women are not hating men as men, but only as paltry party politicians—and surely no one need mind *that!*—and that all he has to do is to stand loyally by his women, relinquish a few of his traditions and prejudices, relax a little of his mental rigidity, and remember for his tranquility that, whatever her new developments, the inborn pitifulness in a woman's nature will always be there for a man in all times of his need and distress, and the greater the knowledge the more tender that pitifulness.

Lots of other things, too, I would like to tell him. I would like to remind him that whenever women have fought and striven for a cause dear to man he has admired them wholeheartedly—even canonized them! Why should he admire them less when they are fighting for themselves?

And I would like to tell him that when he no longer is here to protect his womenkind, his protection will nevertheless hover over them to the end of their days, if he has given them the equipment with which to fight the battle of active life and full rights of citizenship as a weapon of defense against the ever-encroaching inroads into their private and personal life—inroads obviously foreshadowed by this new domestic legislation.

Who knows what a few years may bring forth? Already official tyranny stands waiting on the doorstep.

London, England.

Western Types of Higher Education

By Albert Bushnell Hart, Ph.D., LL.D.

[Professor Hart was the first of the Harvard professors to be sent to the western colleges according to the new exchange system mentioned in the last paragraph. As the author of *Studies in American Education* (1895) and numerous works on American history, government and social conditions, Professor Hart's observation on educational conditions in the West are of especial interest and value.—EDITOR.]

Seven months spent in the West, a considerable part of it in close touch with higher education, leaves a vivid and favorable impression of the conditions of intellectual and pedagogical progress in that part of the country. The West is an indefinite term; for, fifty years ago, Pittsburgh and Buffalo were Western cities; and nowadays you meet in Colorado people who claim to come from the East because they live in Chicago. To most cis-Allegheny minds the West is anywhere out beyond Lake Michigan and the Mississippi River.

This big West is not all alike in education or anything else; but there are within it no such distinctions as those between New England, the Middle States and the old South. Arizona and New Mexico are much more like Wyoming and Montana than either is like any Eastern community. The educational systems of California, Wisconsin and Oklahoma have much in common.

One reason for this likeness is that all the Western educational ideas have been transplanted from the East. The idea of rural schools managed by small local bodies; of public high schools on a large scale; of State supervision of education; of normal schools; of denominational colleges—all these and many other ideas are of Eastern origin, and in many cases have been applied by Eastern people, either as members of boards of education or as school officials.

On the other hand, the West has also made great contributions to education, some of which have overflowed into the East. Such are manual training schools; State universities on a large and practical scale; agricultural education that takes hold of the farmers; coëducation, music and foreign languages as a part of general school education; summer schools for secondary pupils.

The most striking feature of Western education is the predominance of public over private instruction thruout the system. In many of the Western cities, particularly the smaller, the high school is what the Boston Latin School used to be—the obvious opportunity for gifted boys. Many Western cities have no private schools of significance, either for boys or girls, and such as there are have grown up in recent years. Most of the expensive private country schools have so far been patronized by Eastern boys, but boarding schools and country day schools are appearing in the suburbs of the larger cities, and a few girls' schools of the finishing type are now being built up in Denver, Los Angeles and elsewhere.

There seems little doubt that the West will, before long, undergo that separation of children, from the kindergarten upward, which has come about in the East. The reason in the minds of sensible parents is not an unwillingness that their children should associate with the sons of poorer and less conspicuous parents, but that the high schools are artificial places in which athletics and social life, combined with secret societies, tend to interfere with intellectual development and to build up inside the high school a disagreeable class spirit. How far this objection of parents is founded, and how widely it extends, a visitor can hardly judge. A high school of 1,000 or 2,000 pupils is not the same thing as that body of 100 or 200 pupils back to which so many of us look with gratitude.

Above the high schools Western education sets strongly toward State institutions, tho they are in the Mississippi Valley younger than the de-

nominational institutions. Western Reserve College was founded in 1825, Oberlin in 1833, Knox in 1837, a year before the foundation of the "Episte-miad," which was the first form of Michigan University. The West was full of rival denominations, each of which desired to keep up a proper theological environment for the children of its adherents. Ohio, Indiana and Illinois together now possess something like ninety so-called colleges and universities, founded on endowments and originally denominational training schools, as well as literary institutions. Nearly all of them have lost their denominational bias, for the simple reason that they can hardly live without drawing in young people from other churches. Some of them—as, for example, Grinnell College, Iowa—have become rich and powerful universities, able to keep up with modern needs in education; others are what they were fifty years ago, with little more money, few more students and an outgrown course of study.

Alongside them is the group of State institutions, the most striking factor in Western education. It includes units of great variety in means, population, teaching force and facilities. The smaller and weaker States, like Nevada and Wyoming and Arizona, have a small constituency to draw from and little money to do with, and a shorter life than their neighbors. In these States, also, politics has a larger influence than elsewhere. There is a delightful story afloat about the distribution of State institutions to the ambitious towns of Idaho. Boisé got the State Capital, another town got the Penitentiary; and Moscow, far off on the western border, had to put up with the State University. A visiting committee from the legislature went up to Moscow recently and found hundreds of students and an institution which made prosperous its neighborhood. On his way home one of the visitors, with a sigh, expounded to a friend what he had found there, winding up with: "And I tell you our people made a big mistake; a penitentiary hain't in it with the State University."

The Western State universities were already under way when the Morrill Act of 1862 bestowed on each State an immense land grant to be used for the development of agricultural and scientific education. This was not an unmixed blessing, for the institutions were poor and the community was greedy for cheap land, and most of the land grants were sold cheap. The Minnesota University lands were located by chance upon iron ore beds, the value of which is guessed at $100,000,000; and when the State of Washington was admitted, Congress provided that none of the 2,700,000 acres given the State for various purposes should be sold for less than $10 an acre. Some States set up or enlarged a single institution for the various purposes recognized by the land grant, particularly Illinois, Wisconsin, Minnesota, Nebraska and California. In Colorado there is a university, a mining school and an agricultural college at three different places, only a few miles from each other. Oregon has a university and also a technical college about twenty-five miles apart. Washington has substantially two universities—an eastern and a western—but then they are 400 miles apart.

In many of the Western States a fierce competition is going on between the State University and the denominational colleges in that State. In Michigan the colleges are few. In Wisconsin and Minnesota the good colleges are but a handful; but in Illinois and Iowa there is a considerable body of little colleges, some of them styled universities. The only wealthy and powerful endowed college in the whole West is Chicago University; but the success of that renowned institution has stimulated all the near-by State universities to organization and to a successful demand for appropriations which would never have been possible but for this rivalry.

For a long time the universities were rather crude and unlovely as

places of residence, and the heads of the colleges did not fail to point out the irreverence and un-Christian life and uproar and disturbance of State universities in contra-distinction with their own serenity. But nowadays these State universities are becoming places of elegance. They abound in fraternities and sororities; are providing a special supervision of women students and of freshmen; are beginning to erect dormitories for the girl students; and will infallibly come to the point of housing the men also. If anything, there is too much social life in the State universities.

The universities also include what almost none of the colleges are able to provide in the way of professional education. Some colleges have engineering courses, which, however, are expensive and hard to keep up on a parity with the stronger institutions. A few, like Northwestern University, have affiliated a law and medical school in a neighboring city. In general, however, their students who wish to study the professions must do so elsewhere than in connection with their college. The few great institutions in the country, particularly Johns Hopkins and Harvard, which admit to their professional and graduate schools only holders of an A.B. or kindred degree, are, therefore, on very friendly terms with the colleges thruout the country. Not so the State universities which admit to their professional schools on the basis of about two years of college training, and openly recruit college students at the end of their sophomore year. So far as they are successful in this method they are breaking up the colleges.

The difficulty does not end here. The State universities in the communities where they have been longest established have very close relations with the public high schools; a large number of the teachers, principals and superintendents are graduates of the State University; graduates of such high schools are admitted to the university on certificate; university professors visit and incite the high schools. A widespread object is to make the high schools so advanced that their graduates can directly enter the university professional school. Not only the State universities, but the University of Chicago, are supposed to be urging the high schools to assume instruction which till now could be had only in the colleges or universities.

The universities offer and press terms of common action upon the colleges, namely, that if the colleges will give up their two last years and the granting of the A.B., the universities will affiliate them and practically make them higher secondary schools. This is the plan formed and openly advocated by Chicago University and several of the strongest State universities. The process reminds one of the South Improvement Company of forty years ago, which was one of the first protean forms of the Standard Oil Company, and which came to an understanding with a large number of small refineries by offering to purchase their plant at from one-third to one-half its cost.

The question is still further complicated by co-education, which was introduced into most of the Western States in the earliest district school, passed to the high schools; and then, when the question came as to what the girl graduates of the high school could do, appeared in the public universities. Every Western State university or other institution admits women. In the University of Michigan they have nearly "corralled" the A.B. degree; they take it, excel in it, receive honors in it, and the men tend to slip out into the scientific degrees. Now that woman suffrage is making such advances in the West, there is not the smallest likelihood that this policy will be reversed in any institution supported by public taxation.

Most of the colleges have been driven by competition to take the same step, Beloit being almost the last to hold on to the principle of a college for men exclusively, and Beloit gave way some years ago. In general the colleges make considerable distinc-

tions between the sexes. Nearly all of them have dormitories and separate dining-rooms for the women, the most elaborate and comfortable plant being that of Colorado College with its four grouped dormitories and common dining-hall for the girls.

Chicago University is practically committed to co-ordinate education, the late President Harper having, rather in defiance of his faculty, established separate instruction for the girls in the first two years. No college farther West has followed out this plan completely; and there is as yet in the West no strong college of national reputation for girls exclusively. In all the co-educational colleges, however, there are murmurs of discontent; and it seems not unlikely that in a quarter century more the coördinate plan which has been so successful in Radcliffe, Barnard and Western Reserve will be applied in most of the colleges which are not controlled by State officials or limited by their charter on that point.

The Harvard exchange system with the Western colleges, the first service in which extended from February till June, 1912, arose out of the requests of the presidents of four colleges—Knox, Grinnell, Beloit and Colorado—that Harvard would show interest in and sympathy with their problems, and particularly in the maintenance of a four-year arts course. The experience of the first incumbent in that exchange leads to the belief that the college type of education has a strong and deserved foothold in the West, and is likely to continue to appeal to many parents. The endowed colleges have a freer hand than the State universities in the education of girls. On the other hand, they are not physically able to compete in technical and professional study. Visits to some of the best high schools in the West have convinced the writer that for many reasons they are not fitted to assume the task of the earlier stages of college education which some of the universities are trying to force upon them. The colleges are likely to grow less slowly than the universities, and the founding of new colleges of significance is not likely; but they have a very important part to play in the development of the general intellectual life of a community, and in the long run may be expected to maintain their place in Western education.

Cambridge, Mass.

Saints and Their Pictures

By James B. Wasson, D.D.

[This iconoclastic article by the Director and Chaplain of the Strangers' Welfare Fellowship will voice the sentiments of many a good Protestant who, tho silent, has always felt that the stained glass window should not be allowed to color the pure light of the Gospel.—EDITOR.]

When a great express train arrives panting at its destination the crew of trainmen immediately proceed to strike sharply each wheel with a hammer, to see whether it is sound or cracked. We are beginning, tho slowly, to test similarly many of the old usages, methods and ceremonies of Christianity inherited from the past, to see whether they ring true to the needs of the present. We have in fact gone even farther than that, and have also tested certain dogmas, with the result that they have been reverently tho firmly laid on the shelf, as no longer serving any useful purpose.

But curiously enough, we have failed to apply any such test to the traditional medieval art which we are reproducing so undiscriminatingly in our churches. We accept this art as a finality, much as we accept the fundamental doctrines of Christianity, even to question which would be almost blasphemous. And yet I venture to assert that an overwhelm-

ing majority of plain people find no spiritual help or uplift in this art. They have ceased to regard it as true to the facts; and they utterly refuse to take it as the expression of any real Christian life or any real Christian faith. They class it with the pictures in books about fairies, interesting it may be, as the expressions of a fantastic fancy, but grotesque if regarded as a portrayal of events in real history.

Brethren of the clergy, your parishoners won't tell you, for they wouldn't dare even to whisper it to themselves; but many of them are weary of this art conventionalized to the point of deadness. They find nothing helpful or inspiring in those solemnly stupid looking men and women in many colored flowing robes and a nimbus around their heads whom at such a great expense we put in our church windows, making the churches gloomily dark by keeping out God's sunshine. While it is seldom true that clothes make the man, it is nearly always true in the world of Christian art that clothes make the saint, clothes and the aforesaid nimbus. Did you ever see any of these pictured saints doing anything useful for himself or his fellow men? Never; they simply couldn't without disarranging their clothes. And so all they do is to stand in an unnatural attitude, often on a cloud, and keep their eyes glued to the earth as if they were ashamed to look any one in the face.

Such pictures, no matter how great were the artists who painted them, are utterly out of harmony with the many-sided and complex life of the twentieth century, with its great impulses for the service and betterment of men and women. It is time they were put on the shelf along with the pictures of Mother Goose and Jack the Giant Killer. For the hectic piety they inculcate only serves to puzzle and anger the strong men and women who are face to face with the problems of the real workday world, where people don't wear many-colored robes and nimbuses, and are too busy doing things worth while to assume any stained glass attitudes. More often they are covered with the grime and dust of the life-and-death conflict; and they look with a certain pitying contempt on the pallid medieval saints, who seem to have no bones or muscles to speak of, but are just an excuse on which to hang some pretty colored draperies.

And bear in mind, the actual saints these pictures are supposed to represent, were not in the least like the pictures. They were virile flesh and blood men and women, as were also the first Apostles and disciples of the primitive Church. They were all intensely modern, as to their age, just as we must be as to our age, if we are to do the work of our day and generation. What the poet said of woman ought to be true of the worthies who are held up to us as an inspiration and an example. They should be painted for us as creatures "not too bright or good for human nature's daily food."

If we are to draw on our imagination in picturing the early Apostles and saints let us at least try to represent them as they actually were, plain folk, mostly peasants and fishermen, wearing the ordinary garments of their class and time. I have never yet seen a stained glass picture of St. Paul, for instance, that gave any hint of what the real man probably was, an undersized hooknosed Jew, with very bad eyesight, unprepossessing to look upon, much given to overstatement, sometimes guilty of bad logic or swerved by prejudice, with a caustic humor, a sharp tongue and a tender heart. Such a Paul as that is human; we can tie up to him.

And when we remember that this little Jew, handicapped as he was, shaped and colored Christianity, stamped the impress of his genius, his all-embracing love, his divine inspiration on nearly twenty centuries of its history, left a collection of perhaps a dozen letters which have done more to fix and direct the evolutionary movement of Christian civilization than any other agency known to

history we are infinitely touched by the glory the grandeur, the greatness of his personality and life. None of the conventional pictures of Paul, in which he is decked with pretty flowing robes, furnished with a nimbus, and perhaps a crucifix, can bring that tremendous personality home to our hearts and to our consciences. They are rather a grotesque hindrance to our real understanding of the real man.

But let us, either thru reading or pictures, come to know intimately the true Paul as he was, a saint without a halo, a victor without a crown, and we will then have a conception of what he was and did. Thru the fog and mists of nearly two millenniums the vibrant figure of this great leader of men will stand before us pulsating with life. The art that conceives of a saint as a sort of vapid and anemic angel treading on clouds, is dead and buried beyond hope of resurrection. The only art that can enthrall and uplift the world is that which will find its inspiration and its home in the great temple of truth.

New York City.

Wanderlust in Business

By William Frederick Dix

[In the article on "Business Poise," publisht Jan. 16, Mr. Dix showed how large affairs may be managed with little nervous strain or lost motion. In the following he presents a companion picture of the impulse that leads men away from their proper business into strange adventures. Mr. Dix is acquainted with the conditions of modern business both from observation and experience. He has been editor of *The Churchman* and of *Town and Country*, and is now secretary of the Mutual Life Insurance Company of New York City. Two books have come from his pen, *The Face in the Girandole* and *The Lost Princess*, and a series of essays on the psychology of the business man will form a third.—EDITOR.]

Then its go, go, go away from here,
On the other side the world he's overdue.
Send the road is clear before you
When the old spring fret comes o'er you
And the Red Gods call to you.

Kipling, in his incomparable poem "The Feet of the Young Man," strikingly expresses the longing for adventure, for change from the humdrum of life, the *Wanderlust*, that is innate in most vigorous men. To those who are bound by daily routine, the thought of adventure in the wilds is most alluring. They picture longingly to themselves the camp fire in the pine forests lighting up the faces of hardy companions grouped about it, they hear in imagination the noise of the sea as it foams against the boat-prow, they long for the dangers of the struggle up some treacherous glacier, or the exploration of the dark jungle;—*anything*, "away from here." Man is naturally a roaming soul and restraint is of necessity irksome. In our American business life, the young men usually and rightly yield to the lure of the more-or-less wild and work off their superfluous energy in sports and pastimes, but as they grow older they become more and more immersed in their vocations and the allurements of moose hunting or duck shooting or Alpine climbing grow less insistent. The *Wanderlust*, so far as its conscious expression is concerned, is buried, but it is my belief that it merely retires into one's sub-conscious nature and finds its expression among business men in another way. Here are a few specific instances.

I know an architect, overworked and eminently successful in his profession, who recently backed a plausible young stranger in the making and selling of a new furniture polish. The inventor seemed to be honest enough but he did not know how to market his goods and, of course, the architect did not. The latter found himself constantly interrupted in his professional work with problems about advertising, selling agents,

factory bills, and innumerable details of a subject about which he was entirely ignorant. He grew more and more annoyed and worried, lost sleep and energy, and his own work suffered in consequence. The money thus dissipated was the least important part of his losses.

Another man I know is an editor and he occasionally drops some casual remark about a little turn on the Stock Exchange. He will say, for instance, "Well, I have just sold A. B. & C. at a 5-point profit and made $500 since I bought it last week." It certainly *sounds* well; this casual reference to easy profits entirely above his salary. But I notice that these remarks always relate to the times he makes something, never to the times he loses. And I know he loses at times. But even if he does make a profit in the long run, my friend does not realize how costly are his winnings. First, he is growing more and more nervous, he is gloomy and worried when the market is against him, and excited and restless when he is winning. Shall he hold on for another point or not? If he does not, he is irritated because he might have made more. If he does, he has held on too long. He leaves his office several times during the day to step out and look at the ticker. What a preposterous thing for my friend to do,—spoil a good literary man to make a poor and petty speculator! His work is suffering, his serenity of spirit and peace of mind have vanished. For he dreams of sudden wealth that never comes and which, by the way, he does not need. He was thoroly happy in his work before he began to dabble in stocks; now, even if he should win,—which is extremely doubtful,—his winnings could never pay for the loss of his contentment.

I know of several elderly men, who, having retired from business, with a comfortable fortune after long years of successful work, instead of settling down to some agreeable avocation—traveling or gardening or collecting something or making a study of some subject which has long attracted them,—wander about aimlessly for a few months and then put more money than they can afford to lose into some hazardous business experiment or invention or gold-mine or promoting scheme, on the bait of being made president or vice-president and winning quickly more money which they do not need. They start in with enthusiasm on a line of work utterly unfamiliar to them; jeopardize their money and even their reputation as sagacious business men, and, in the end, retire from a "busted" enterprise, chagrined, disillusioned, and humiliated. Why do these hitherto successful business men never succeed? Because they gained their experience from business-upbuilding thirty or forty years ago when conditions were utterly different. They now find themselves associated with young men whose methods they cannot understand, and face to face with a competition which seems to them almost ferocious in its intensity. And the chief reason they fail is because the scheme is probably not feasible in the first place and the self confidence they had acquired from their former successes led them to make the mistake of passing upon the merits of a business about which they knew nothing.

Is it not a curious thing that hardly a man can pass middle age, no matter what his business or profession, no matter how conservative or careful his temperament, without taking a few of what is colloquially called in the business world "flyers." The most hard-headed manufacturer will buy stock in some wild-cat oil scheme and swallow his losses in secret chagrin. The promoter of gold mines, patent devices of all kinds, land speculations, timber claims, oil wells and so on, does not by any means have to confine his efforts to unworldly rural clergymen, doctors, school-teachers, and widows; he will always be sure of finding victims galore among those who are usually called "conservative and substantial business men."

Why do these men yield in this erratic and illogical way to the siren call of chance and invest hard earned savings in visionary schemes? Is it not this very *Wanderlust* which Kipling describes but applies in his poem objectively rather than subjectively? The Red Gods call; the Spirit of Adventure suddenly appears in a rosy vision, shaming in contrast the humdrum world, a vision alluring in its novelty throwing into gloomy contrast the factory wheels or the too-familiar warehouse or busy office. The cost is little, the possibilities immense! The false Duessa smiles and beckons; the daily task suddenly palls and it is "go, go, go away from here."

All this is not to argue that a man should stick too close to his last, however. There is nothing more deadly than the man who thinks of nothing but his own business,—deadly as a social companion, deadening to himself. The men who have made the greatest business successes in this country are those who have emerged from absorption in one business and have become directors in many. But those men first gave their whole energy to the one and then became associated with *allied* interests only. The great banker is director in a score of railroads, trust companies, and financial institutions; the railroad president becomes director in coal companies, banks, and so on, because those interests are all allied. The trustee of a savings bank is a helpful one if he has sufficient intimate acquaintance with railroads to know the investment value of their bonds and, likewise, a man increases his own ability by understanding the business of those concerns directly or indirectly related to his own. But this is not *Wanderlust*. The line of demarcation is drawn between a natural broadening of business interests and a sudden, freakish and impulsive plunge into some unfamiliar line.

If a man must have some vent to let his superfluous energies overflow, let him either branch out along business lines in which he is well versed, or take up some hobby. A hobby is the best balance wheel a man can have. Let him find relief from business cares by breeding prize poultry, or studying a foreign language, collecting rare manuscripts or old china or engravings or by orchid culture or making lantern slides or by yielding to the true *Wanderlust* and taking adequate vacations. Along those lines he will find true diversion and recreation and, when he retires from active business, he will have something to fall back on—something to keep him from growing restless and from perhaps plunging into absurd business ventures. Then this curious, strangled, sub-conscious impulse for adventure will not be so apt to seize him unawares and lead him into freak business schemes which, if they could be investigated and cataloged and inventoried and molded into definite figures by the statistician, would surely reveal startling losses of money, time, nervous force, health and reputations, in this curious hodge-podge conglomeration of misunderstood motives, influences and ideals which we are pleased to call life.

New York City.

The Business of Farming

The Revolution in Working the Land That Has Almost Been Accomplished in the East

By George French

[Mr. French is entitled to speak with some authority about the progress that has during recent years been made in the business of farming. The son of a New England farmer, he has never forgotten the hard life of his youth. Tho not a farmer himself, he has kept in close touch with the progress of land working, has been an enthusiastic and effective advocate of the East, and has delighted in the recent great revival of profitable farming in New England, New York, and other Eastern States. Two years ago he compiled, for the Boston Chamber of Commerce, a sturdy volume about the farming, commercial, and residential progress in New England, himself writing a goodly portion of the book.—EDITOR.]

Farming, in the old sense, as a means for producing from the land those crops which may be handled as merchandise, is dying. In its stead there is coming on to the industrial stage a new profession and vocation. The men who are beginning to make their presence felt as producers of and dealers in the products of the land are practical scientists, manufacturers, merchants, and farmers as well. They are applying the knowledge the agricultural schools are teaching, in the manner recommended. They are manufacturing milk, wool, pork, mutton, eggs, chickens for the table, vegetables, fruit, hay and grain, and in some degree beef, hides, horses, and other stock. They are marketing these products with the skill of the trained commission men; and withal they are farmers, in the best and truest sense, and not altogether different from our fathers and grandfathers.

It is not easy for the habitual readers of the newspapers who are dwellers in the towns and cities to realize the extent to which the revolution in the methods of working the land has already progressed. The habit of thinking slightingly of the farmer is ingrained in us. We cannot yet conceive of the man who tills the soil as other than the farmer of our imaginative memory—a somewhat pitiable figure, poor, hard-working, and rather stupid and determined in his extreme conservatism. But the agreeable fact is that all over the country there are many men now working the land who compare favorably with men in other lines of business. Indeed, it is evident that the modern farmer is superior to the average successful man in many other lines of business. He must be something of a chemist, something of a biologist, something of a naturalist, a good general, a more than good financier, a good executive, a man of courage and vision. He must be able to draw from the inert and secretive land its utmost tribute, and he must be able to fix the nature and the amount of that tribute. The land will make no promises. It will not guarantee potatoes nor corn nor wheat nor beets nor peaches. The secret of its fecundity must be wrested from it. The old-time farmers did not know how to get at this secret, which is the secret of their poverty and is the cause of much of the hardness of their lives.

But the man who works the land gets the habit of reserve. The land teaches him silence, by its silence. So the fact is not realized that everywhere in the East, and in the extreme West and Northwest, there is a rapidly growing class of scientific and successful farmers at work building up the business of working the land into a great profession. They are everywhere, but more noticeably in the sections named. The Middle West has had one of its days,

and will have others. It is just now taking breath. The new farming is more noticeable in New England than elsewhere, for obvious reasons. That region has been very near to decadence, while the other Eastern States have never been as near. Farming in New York, New Jersey, Pennsylvania, the country around Chesapeake Bay, and some of the northwestern portions of the South, has never been at as low ebb as in New England. The land in those sections is fundamentally better, and more adapted to reward perfunctory and ignorant tillage. New England is not blessed with deep soil nor naturally fertile land. It is an ideal place for the trial of the new knowledge and the new theories about land. If the thin, rocky, cold lands of New England can be made to yield profitable crops, there is nothing to fear for any other section. So interest has been drawn to the work of the progressive men in New England.

That work is most interesting. Its results have already been important and promising. There is a farm in Connecticut for which its owner has refused $1,000,000. There is a farm of 1000 acres in lower Vermont that pays its owner more than ten per cent, clear of all possible deductions. It is operated with as much care as a bank. Its manager is a highly educated and skilled man, who is a student and executive as well as a soil expert and a biologist. He makes 25 per cent on a large flock of Dorset sheep, raises pure Jersey cattle and Berkshire pigs. There is a man in Connecticut who has won the title of "Peach King" of America, who has developed, from a raw boy of 14 struggling to support his mother and brothers and sisters while he paid off a mortgage on the few rocky acres his father left, to a millionaire, working the same land that kept his father poor. A Massachusetts man made $1200 from one crop from a little over ten acres of wheat. A Vermont man received over $20,000 for one crop of apples, and has refused $50,000 for his farm. A Rhode Island man gets in the neighborhood of $15,000 a year from a 40-acre orchard. A man in Maine gets $2000 a year from apple-trees that grew wild in the pasture when he bought his farm—for $650. From 553 trees a New Hampshire man sold $8000 worth of apples in three years. A Massachusets man picked 3200 baskets of peaches from 900 trees, netting $2500 from the crop. Maine, Massachusetts and Vermont growers of strawberries get from $1000 to $3000 an acre.

Similar tales can be told of profits from cows, sheep, hay, potatoes, corn and other grains, lambs, pork, poultry, and many kinds of garden truck and specialties. One Connecticut farmer has a gross income of better than $80,000. He raises, normally, 1000,000 baskets of peaches, 1000 barrels of apples, 800 tons of hay and about 5000 lambs. These are not exceptional cases that are quoted, and the list might be indefinitely extended. There have been hundreds of new apple orchards put out within the past three or four years, and many old orchards have been revived by proper treatment and fertilization. One apple orchard, near Boston, of about 400 trees had been for years neglected. A tree doctor spent about $700 pruning, fertilizing and spraying, and the orchard produced about 1000 barrels of first quality apples the first year—the same year it was treated—which sold for $3 per barrel at wholesale. The markets of the Eastern cities are beginning to receive native apples as handsome as those from the famed Hood River Valley, and graded and packed with as much skill. Within the next five years there should be in all Eastern markets a supply of native apples grown under the best modern conditions and handled as the West has taught us they should be handled. The East, and especially New England, can raise better apples than either of the famed regions of the West or Northwest, because Nature provided the climate and the soil. Apples of the best flavor and texture

can only be grown upon land the principal ingredients of which are such chemicals as the New England rock formations furnish. None of the Western sections can produce apples with the flavor of those grown in New England, New York, Maryland, Virginia, and in limited sections of two or three other States.

The new agriculture brings the more or less "barren" East into its own, and its own is a wonderfully rich new asset. The new agriculture has taught us that it is not so much what the land is as what we do to it and with it that makes for profitable farming. The soil should be a naturally good medium for the material we must add to it and the climate must be lenient in the way of frosts and prodigal with sunshine. Water even may be provided, and all kinds of fertilizing agents. New England's rocky, sandy, dry, light soil is ideal for the purposes of the soil expert. It has mostly been made from the New England rocks. It has the requisite chemicals. It needs the humus, and some of the other plant foods. These are easily added, whereas in the deep humus of the Western States there is a fix condition that makes it less easy to adapt the soil to the particular purposes of the farmer. Fruit trees require the chemicals furnished thru the erosion of the New England rocks, and that is an element that cannot well be added to the humus of the deep black soils of the West and Southwest. This fact transposes the supposed arid and worthless hill lands of New England into potential apple and peach and plum orchards of great value, and the transposition may be made as rapidly as enterprise dictates. It is going on at such a rate that for several seasons the nurseries supplying young apple trees have not been able to meet the demand.

I do not wish to sing the praises of New England to the exclusion of other sections as worthy. It furnishes the best illustration of the possibilities of agriculture because of its supposed soil poverty and the hard fortunes of its farmers. Everywhere the business of farming is supplanting farming in the old sense, and everywhere this new agriculture is opening opportunity. It is to be the compensating power that will enable us to forget that there is but little more free public land to be taken up by homesteading farmers, and it furnishes us with the sufficient reason for rejoicing that there is a near limit to the excuse for land robbery. It would be a great public blessing if there were no more free land, and no more cheap farming land. We have all the land we need, or shall need for generations to come. We are not utilizing the land we have to the extent of half its real capacity—probably not to the extent of ten per cent of its potential productive power. The pathway to profit for the new farmer is intensive cultivation and the reclamation of disused lands. There is opportunity in this direction to more than compensate this and the coming generations for all the advantage our forbears had on account of cheap new land. In New England this consideration is being recognized and proved. There are few towns free from the influence of the new knowledge and the new ambitions. Model farms are everywhere. And the hopeful feature of the revival is that the new farmers are working for, and getting, commercial profits. The day of the theoretic farmer, and the man who farms for pleasure, has passed. The progressive farmer to-day, whether a man of the soil or a city man operating a summer-home proposition, seeks to make a profit, and makes it. While some years ago the city owner of a farm took a grim pleasure in computing the enormous cost to him of cucumbers raised on his summer place, he now exhibits the figures of his net profits from the farm, and tells how his manager charges him city rates for the produce delivered to his summer-home.

Those writers who cry out that the land available for more farms has disappeared, and that therefore the

high cost of living must go higher yet, do not appreciate the extent and significance of the movement toward scientific farming, which is the same as sensible farming. It is true that the old race of farmers do not understand the new knowledge, do not believe in it, and will not turn to it. They will be old-fashioned farmers to the end, but few of their sons are following them. Until quite recently their sons went into other business, went to the towns and cities. Now the tide is turning toward the land, and the young men who have been born on the farms, under the old conditions, are in increasing numbers either going to agricultural schools and then to the old farm to reform it, or are undertaking the reform without the school training. There is no occasion for pessimism, or for fear that the supply of land will fail. There has never been a time in the history of the country when the future of farming, and the production of food stuffs adequate to our needs, was more assured than now. With the disappearance of the elder generation of farmers now in control of the land the revolution in knowledge and practice will become more evident, and with the advent of the generation that will succeed our junior generation that which we are now calling a revolution in land treatment will be the common practice, and there will be a new and different revolution in prospect. Every carton of scientifically grown and properly packed Eastern apples that finds its way into the retail markets is a sign and promise of the better things that are imminent. And they are coming in such quantities and so frequently that we are beginning to believe they will be staple by another season, or perhaps the season after, along with a wide variety of other produce that we have taken at second-hand from other sections of the country.

The real farmer is all right. It is the men who will not learn, or who are too old or too poorly equipt with business ability, that are deteriorating and getting ready to disappear, as factors in farming that has commercial or social significance.

Western Land Problems

The Rapid Rise in the Price of Land Produces a Critical Situation

By J. H. T. Main, Ph.D., LL.D.

PRESIDENT OF GRINNELL COLLEGE

Increase in farm and land values during the decade 1900-1910 in the entire West beyond the Mississippi is one of the most astonishing phases of our national development. The values in three or four of these States will illustrate conditions in the entire region. In Iowa the increase of farm values for the decade was very nearly $2,000,000,000, an increase that more than doubled the census valuation for 1900. In the newer States west and north of Iowa, the percentum of increase was greater. In North Dakota the increase was more than $719,000,000, or 281.9 per cent; in South Dakota $868,000,000, or 291.9 per cent; in Nebraska, $1,300,000,000, or 178 per cent.

A clearer view of the situation is obtained by reducing figures to single farm and acre values. The average size of an Iowa farm in 1910 was 156 acres, its value $17,259. This value represents an increase in ten years of more than $9000, altho the size of the farm remained practically

unchanged. The average size of a North Dakota farm is given as 382 acres, its value a little more than $13,000, an increase of nearly $8000 for the decade. In South Dakota the increase is from $5600 to $15,000, the average size being 335 acres. In Nebraska the increase was from $6155 to $16,000, the average size being 297 acres.

The average value per acre in Iowa went up from $36 to $86, an increase of 104 per cent; in North Dakota from $11.15 to $25.60, 130 per cent; in South Dakota, from $9.92 to $34.69, 249 per cent; in Nebraska, from $16.27 to $41.80, 156 per cent.

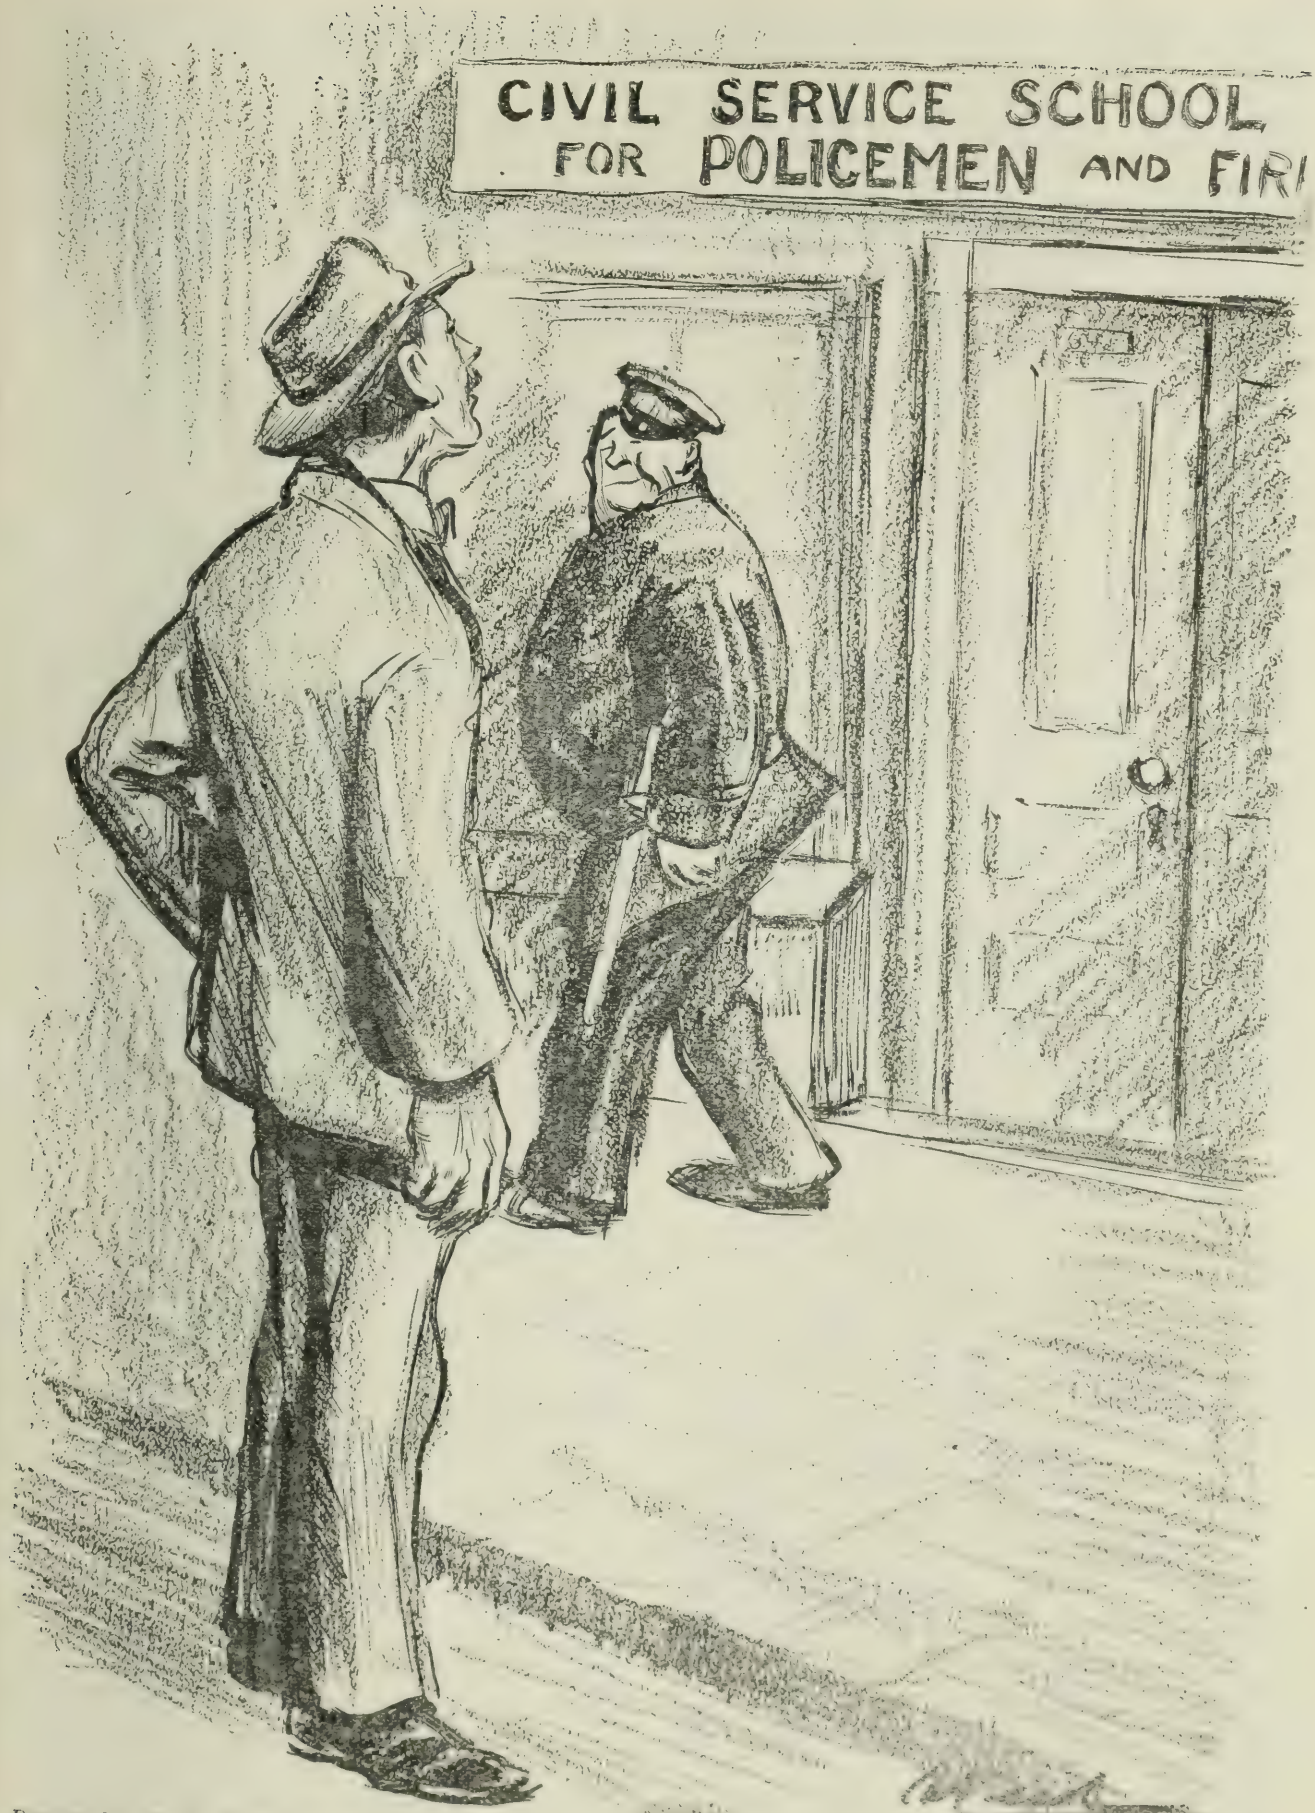
The story of increase does not end with 1910. Values are rapidly and steadily going up. Prices for good farm lands in Iowa at present are as high as $250 per acre and purchasers of desirable lands do not anticipate paying anything less than $125 per acre. Values in neighboring States are in proportion to these values, while in the irrigation districts in the States further west the prices for lands under cultivation, or ready for cultivation, are often much higher.

These figures are intensely interesting in themselves. The inferences to be drawn from them are more interesting and significant. Of the first importance is the practical assurance that there is no prospect of an immediate abatement of the upward movement of land and farm values. Ten years hence, unless unexpected conditions arise, the figures will unquestionably show an advance quite as surprising as the advance of the last ten years. Such a result will mean necessarily a marked change in farming and agricultural methods. It will change very materially the character of the farming population. It will profoundly affect the character of immigration to these States and it will tend to modify greatly the currents of immigration that reach our shores. There will be an inevitable increase of the day laboring class and a further congestion of population in our already overcrowded cities. This will in its turn intensify the critical character of our social and civic problems, problems that are already demanding more attention than we are giving them.

The land question is one of the most important economic questions of the present day. The most disastrous condition that can exist in the great agricultural region of the Middle West is prohibitive prices on land. Such prices keep out the very class of people that are most needed for their social and economic progress. Values that deaden or retard social movements are an injury rather than a benefit. One of the most insistent problems before local Legislators is some method of treatment whereby the actual producing value of land may be kept in equilibrium with social and economic need. A State cannot prosper permanently if land having a farm or producing value of $100 per acre has a market or speculative value of $200 or $250 per acre. Nevertheless, this is the condition that exists in many western States. Such a condition may be expected to bring about, sooner or later, an entire change in the theory and practice of taxation.

The question has been often asked in late years why the boys brought up on the farm do not stay on the farm. One answer is that the majority of them cannot afford to do so unless they inherit land enough, at the time they are thinking of an independent life, to make farm life desirable. To buy land is beyond their means, and their ambition is forced into another direction. They have tasted the strenuous character of the average farm life. They have read reports from the State universities, technical schools and colleges and they know that there is an open door for them and free tuition at many of these institutions. The way thru the college and university to a professional career is comparatively cheap and easy, hence they choose this way. Every fall the farm loses an army of young men to the colleges and universities. The majority of

these young men enter professional or business life.



Economists tell us that the price on land has nothing to do with the cost of living. The reverse they claim is true; namely, the cost of living has tended to increase the price of land. Whatever the theory may be, cheap food cannot be produced on dear land. High land values and the high cost of living will have a relation in the end even if they do not have one in the beginning. Beef cattle pastured on expensive land and fattened for market on high-priced corn necessarily must be high in price also. If the buyers and packers by manipulation force an unprofitable market, land owners will stop raising cattle. The same principle will operate thru the entire farm schedule. There is an element of determinism in this that no amount of manipulation in the market centers can control. The great free cattle ranges in the West no longer exist. Beef cattle must now be produced on farm lands that are high in value. The result of necessity will be felt in the market. Land is not likely to drop in value unless there is a radical change in present local conditions. Available land for farming purposes is growing scarce. Competition is becoming more active. Population in the country at large is increasing very rapidly. If land should decrease in value, as conditions now are, it would be because it had lost producing power. Such a result would only aggravate a situation already critical. The cost of living in proportion to income on the part of the buyer and price received in proportion to labor and cost of production on the side of the producer, are two elemental things in social and economic adjustment.

The people as a whole are beginning to awake to the consciousness of the fact that the country as such has benefited only slightly from the enormous increase of values. The social contribution made to the upward trend in values has received no adequate social return. A fraction of one per cent on the increase of the last decade would completely change in a short time public conditions—roads, schools and public improvements of all kinds. As the situation now is, the roads are nearly as bad as they were in pioneer days, the schools are indifferent, and wages of the teachers continue to be inadequate, and public improvements in general are little or no better than they were ten years ago. There is manifest social injustice in all this. If the material values in a State increase one or two thousand million dollars in ten years, some fraction of it should accrue to the benefit of the people as a whole.

An ultimate result of high prices of agricultural lands should be the rediscovery of America from the farming point of view. There is cheap land in abundance in the New England States, in the Middle Atlantic States, in the South Atlantic States, in fact, thruout the entire region east of the Mississippi. Much of this land is conveniently located with reference to railroads, trolley lines, turnpikes and towns, and has natural advantages in many cases not found in the West. These lands have productive value and only need right treatment to become as valuable agriculturally as lands in the best farming regions of the West. Furthermore, they would have the incidental value of nearby markets, a denser population and the short haul.

Some of the problems at least which group around land values will be solved by improvement in farm methods. Others are bound up with economic complications and traditions which make them difficult to deal with quickly and satisfactorily. Our land problems are important in the highest degree for the people as a whole, and should receive more study from legislators and students of economic tendencies than they have received. When all is said and done, land is the material basis of our national prosperity.

THE MODERN SCHOOL FOR SCANDAL.

THE NEW BOOKS

Plays of Long Ago

Professor Wallace's contributions to the history of sixteenth century drama are always exciting. The present volume[1] is by no means an exception to his rule, and, for the serious student of the subject, is likely to prove on the whole the most important individual fruit the author's long researches yet have borne. Great masses of manuscript material, bearing crucially upon the first seventy-five years of the modern English theater, are here set forth: some absolutely new; others, previously accessible only in the suspicious versions of Collier, for the first time in safely usable form; yet more in fresh relations which add greatly to their intelligibility and evidential value. Accepted literary estimates of the work of the patriarchs of the drama, from John Heywood to Lyly, are in nearly every chapter knocked sensationally awry; and the monograph receives coherent purpose from the presentation of a single striking thesis.

The value of the book is unquestionable. A broad province of literary history, hitherto befogged by sophisticated records, is illuminated to such an extent that a great many vague current assumptions will for the future have either to be relinquished or established beyond cavil. The main defect of the work appears in the very title. It consists in a mistaking of the part for the whole. Professor Wallace's real purpose is the presentation of the earlier history of the companies associated with the Chapel Royal—a theme of which the later portion was treated four years ago in his *Children of the Chapel at Blackfriars, 1597-1603*. This subject, important but certainly not all-inclusive, has so grown upon the writer that it becomes for him co-extensive with the entire *Evolution of the English Drama Up to Shakespeare*. The distortion is no mere matter of title; it is an integral factor in Professor Wallace's entire treatment. From it springs his constantly advanced thesis that all which is significant in Elizabethan drama originates in the entertainments presented at the court, and, more specifically yet, in those prepared by the various masters of the royal chapel. Not only the influence of the mysteries, but that also of the widespread morality convention, of classic imitation, and of the obscure but certainly important performances of popular mountebanks, is everywhere belittled.

This attitude not only falsifies the perspective in which the early drama is depicted, it tempts the writer also to a number of extravagant claims on behalf of the courtly dramatist even less justified by ascertainable fact than the conventional loose beliefs which he assails. To William Cornish, Henry VIII's Master of the Chapel Children, Professor Wallace gives practically sole credit for "shaping" the new drama, ascribing to him the authorship of the anonymous plays *Gentleness and Nobility, The Four Elements, Calisto and Meliboea,* as well as of three usually accredited to Heywood, *The Pardoner and the Friar, The Four P's,* and *John-John.* Cornish thus becomes startlingly conspicuous as a tremendous dramatic luminary, magnified out of practical invisibili-

[1] *The Evolution of the English Drama Up to Shakespeare*: With a History of the First Blackfriars Theatre. A Survey Based Upon Original Records Now for the First Time Collected and Published. By Charles William Wallace. Berlin: Schriften der deutschen Shakespeare-Gesellschaft, Band IV.

ty; but the facts fail to warrant the metamorphosis. Beyond the author's personal conjecture, no evidence associates Cornish with any of the plays mentioned, while their excessive diversity of style and subject makes the common authorship of all highly improbable. Furthermore, the very fact which leads Professor Wallace to his hypothesis, Cornish's connection with the masks and pageants performed by the royal chapel, serves really to render Cornish's authorship of the unaccredited dramas of his time rather less likely than that of any one else. The court records contain almost our only external evidence concerning dramatic authorship at this period. Regarding Cornish and his chapel productions, and regarding them alone, this evidence is pretty full; and the circumstance that the titles and descriptions of the numerous shows presented by Cornish nowhere coincide with what we know of any extant play should be set down less to unlucky accident than to the fact that the chapel performances under Cornish partook more of song, dance and spectacle than of true drama.

In order to present Nicholas Udall as a court dramatist strictly, Professor Wallace adopts Magnus's conjectural ascription to him of *Respublica,* acted before Mary in the first year of her reign. For the same reason, he follows Hales in dating *Ralph Roister Doister* as late as 1553, and assumes that play to have been designed for court performance. The latter assumption, however, is very dubious in view of the distinctly bourgeois and scholastic interests of *Roister Doister,* while the late date advocated can certainly not be regarded as established till something has been done to rebut the arguments advanced against Hales's theory by Professor Flügel and more fully in Prof. C. G. Child's new edition of the play. In treating the history of the first Blackfriars Theater and discussing John Lyly's association with the companies acting there, Professor Wallace finds himself on very familiar ground, and his conclusions are distinctly valuable.

If Professor Wallace errs in assuming an almost exclusively courtly and native origin for the Elizabethan theater, something is done to balance the scale by Miss Smith's excellent treatise on the *Commedia dell' Arte,* which offers several welcome hints concerning the activities in sixteenth century England of Italian actors of improvised farce.[2] Miss Smith's earlier chapters discuss in very readable manner the origin and mode of operation of the harlequin companies in Italy; but the most novel and valuable part of her essay is doubtless the treatment in chapter vi of the bearing which these companies had upon the course of Elizabethan drama. This chapter, out of which the others seem to have grown, is itself a restatement, with a few minor corrections and some added detail, of a paper published by the author in *Modern Philology* (1908). Similarly the interesting Appendix B on Relations Between English and Italian Drama appears to be based on Miss Smith's earlier dissertation on the connection of Elizabethan literature with the Italian.

C. F. TUCKER BROOKE.

Religion and Psychology

The din of battle in the warfare of evolutionary science and religion is slowly receding into the fastnesses of ignorance and superstition. The protagonists of literary and historical criticism have clearly shown the value of their methods of biblical study and have won for them a secure place in Christian thought. It is generally taken for granted that to be fully equipped for Christian leadership one must think in evolutionary terms and read his Bible in the light of critical results. Just now there seem to be rising more serious and pressing problems in the field of religious psychology. Investigators are trying to find how

[2] *The Commedia Dell' Arte.* A Study in Italian Popular Comedy. By Winifred Smith. New York: Columbia University Press.

the facts and experiences of religion are related to human consciousness and man's psychic powers. What are the laws of religious development? Is this new science able to furnish efficient guidance to the religious worker and teacher? How far is psychology going to explain religious phenomena on a naturalistic basis? Is religion as completely a product of human nature as government or language? Can psychological method deal with the whole realm of religious experience, or are there active in the soul of man powers that fall without the limits of scientific study? These are some of the questions that recent books bring to the fore and insist upon religious leaders considering.

Here, for example, is a volume by Professor Leuba, of Bryn Mawr, in which the author, in the name of psychology, proposes bold solutions of many knotty problems in the definition of religion, its nature, origin, content, and course of development.[3] It is a book with a purpose which transcends scientific interests and looks toward the reform of religion itself. Professor Leuba writes a strong apologetic for the supremacy of his science in the investigation of religious questions. He is sure that the only way to understand religion is to make it a department of psychological study. Viewed from this standpoint, many of its old problems melt into thin air and disappear, while most of its dogmas become absurd. Why reason about the nature or providence of God when the "gods of religion" are merely inductions from human experiences? It is folly to talk of Divine Revelation and Forgiveness if there are no personal relations outside of humanity. In fact, Professor Leuba leaves hardly a crumb of comfort to the old-fashioned theologian, for we are given to understand that philosophy has nothing whatever to do with religion, and even religion itself does not exist by reason of its basis in objective truth, but because of its biological value. Now we might be persuaded to take the claims of Professor Leuba more seriously if his confidence and enthusiasm were more fully matched by the breadth of his knowledge and the precision and consistency of his thinking. His designation of R. J. Campbell as the leading exponent of the movement toward immanence is paralleled by his own shallow exposition of Ritschlianism. "Who has the right to make the distinction between the human and the superhuman?" he asks, and immediately answers that "it is the psychologist." But he is amazed at William James (Has there been a greater psychologist?) because he does not positively exclude the superhuman in seeking to account for certain religious experiences. "William James's effort to find in religious experiences phenomena warranting the hypothesis of divine action is a *fiasco*." And yet when the author himself comes to suggest a religion for the future (another department of psychology) he posits a "transhuman Force of which humanity is the expression," and thinks that we ought to be articulated to it or have some view of our relation to it, as a religious basis. Still we must beware not to think of it "as Purposive Intelligence" lest we find ouselves again "back in theism." This outcome the author would regard as a calamity, but we doubt if the very elect can be saved from it by such a psychological chain of reasoning and amazement, strengthened even by the great faith of a scientist who believes that a modern psychotherapic cult, despite the fact that "it is the product of ignorant and ill-trained minds," "defies logic and offends common sense," yet contains the "important elements of a new religious faith acceptable to the modern world."

To pass from one extreme to another we may make mention of Dr. Murray's discussion of *Christian*

[3] *A Psychological Study of Religion, Its Origin, Function, and Future.* By James H. Leuba, Professor of Psychology, Bryn Mawr College, U. S. A., New York: The Macmillan Co. $2.

Faith and the New Psychology.[4] The title is not happily chosen, for much of the book is devoted to a harmonization of orthodox theology and evolutionary science. But psychology is made to do its share in furnishing "aids to faith," and Dr. Murray evidently finds nothing in the new science at all derogatory to his cherished beliefs. We can hardly think that multiple personality solves the puzzles or effaces the scientific difficulties in regard to the doctrine of the Trinity, nor are Inspiration and Revelation cleared up by the alleged activity of the "subconscious," but it is a striking proof of the virility of Christian doctrines that a man of Dr. Murray's conservative views can find in the modern sciences a satisfactory confirmation of very ancient dogmas.

The work by Horace E. Warner is written from a like point of view.[5] Christian experience of the emotional evangelical type is examined in detail and its course of development traced and accounted for in the light or obscurity of the "subconscious." The author claims that it is by the inner pressure of the spirit, at times bursting thru into full consciousness, that the various phenomena of religion are brought about. The theory is entirely determined by Dr. Warner's theological belief, and no attempt is made to support it by scientific method.

Of quite a different character is the material presented by Mr. George Steven, M.A., of Edinburgh, in his Cunningham Lectures on *The Psychology of the Christian Soul.*[6] This is a work of rare value to the Christian worker in any field. It embodies the most reliable and pertinent psychological knowledge bearing upon "the religion of Jesus Christ as an educative process." The style is lucid, the intellectual grasp is broad and firm and the appeal to experience is sincere and convincing. It would be difficult to find more fruitful and suggestive discussions of any phases of the religious life than those chapters on the place of the subconscious in the development of the soul and the enslaving of the soul thru sin. We have noted several places where the validity of the author's conclusions may be called in question, but not one of these is without the support of worthy evidence. This volume by Mr. Steven proves beyond doubt that psychology has much to contribute to Christian thought and is able to furnish solid help to the religious worker.

The complexity of religion and the magnitude of the task assumed by the competent psychological investigator of its nature and functions are readily perceived in reading Professor Stratton's comprehensive and truly scientific work.[7] The plan of the author is to consider in conjunction and contrast a large number of facts of religion, gathered from widely different sources and grouped according to the acts of mind which give them form. In the religious life Professor Stratton finds an inherent struggle. Antagonistic forces exist in the very nature of reverence itself. The impulse to moral activity is offset by reverent contemplation; gloom and cheer balance one another. These antinomies constitute so to speak the psychical conditions under which progress in religion is made. "For religious motives, like muscles, work best in opposition." Professor Stratton acknowledges that his method is incapable of bringing the whole truth into view, but it is certain that he has uncovered much that will enrich our conceptions of religion. How far we are from the end of exploration in this field we may judge from the author's honest confession at the close of his extensive and profound study:

[4] *Christian Faith and the New Psychology.* Evolution and Recent Science as Aids to Faith. By David A. Murray, D.D., late principal of the Osaka Theological Training School. New York: Fleming H. Revell Co. $1.50.

[5] *The Psychology of the Christian Life.* By Horace Emory Warner, M.A., D.D. With introduction by John R. Mott, LL.D. New York: Fleming H. Revell Co. $1.50.

[6] *The Psychology of the Christian Soul.* By George Steven, M.A., Edinburgh. New York: George H. Doran Co. $1.50.

[7] *Psychology of the Religious Life.* By George Malcolm Stratton, Professor of Psychology in the University of California. New York: The Macmillan Co. $2.75.

The scientific interest in religion leads deep into human nature, where the observer's sight at best must grow confused with the multitude of things seen in a half light that passes into darkness.

If we add to these volumes the careful study and classification of sects according to their psychological characteristics made by Professor McComas of Princeton,[8] we shall have before us enough scholarship and collected material to impress upon our minds the high importance of this new science in the world of religious thought and activity.

An Anarchist's Memoirs

Mr. Berkman takes himself with enormous seriousness. His reminiscences are concerned primarily with himself, with his own feelings, his own thoughts, with the reaction upon himself of the world and all that passes therein.[9] Even in his professed unselfish devotion to the cause of the people he feels at times that no other except perhaps "the Girl" who forms so large a part of his story is so courageous and so self-regardless as himself.

Berkman, twenty years ago, was a Russian Jewish immigrant living in New York. In 1892, at the time of the Homestead strike, he hurried to Pittsburgh and shot and badly wounded Henry C. Frick. For this crime he was sentenced to the Western Penitentiary of Pennsylvania, where, including the time spent in the Allegheny County Workhouse, he served thirteen years and nine months. In spite of his faith in himself, it does not appear in any of these pages that he believes his mad act brought any good to the workers whom he sought to aid. Perhaps he has been enabled to see—what many others have seen—that his action served only to help in the complete subjection and demoralization of the Pittsburgh steel workers. At any rate he justifies the moral purpose of his deed; he has appreciative words for Luccheni, the murderer of Elizabeth of Austria, for Bresci, the murderer of King Humbert, and for Czolgosz, the murderer of McKinley; tho he doubts the "social value" of the last-named assassination. Of Beatty and Dempsey, Knights of Labor men who were convicted of poisoning the food served to strikebreakers in 1892, he speaks in high terms. Their act, he says, deserves to be acclaimed.

The philosophy of their methods is in harmony with revolutionary tactics. Labor can never be unjust in its demands; is it not the creator of all the wealth in the world? Every weapon may be employed to return the despoiled people into its rightful ownership. Is not the terrorizing of scabbery, and ultimately of the capitalist exploiters, an effective means of aiding the struggle?

Even tho it is the practice of Anarchists to set individual sanctions of conduct above social sanctions, it is not likely that Berkman or any of the others would care greatly to be shot or poisoned by some fanatic in the sacred name of the people. Their remedy for social ills is always something to be applied to the other fellow.

While a great part of this book is merely rhetorical trash, it contains matter of the utmost value in regard to the unspeakable brutality, graft and immorality that prevail in the average penal institution. Berkman's statements on these points carry conviction. In nine out of ten cases the helpless being committed to one of these institutions is sentenced to part company with the last remnants of his manhood. A commendatory introduction to the book is furnished by Mr. Hutchins Hapgood, of The New York *Globe*.

The first year of *Index to Dates of Current Events*, an invaluable publication for libraries and press workers, has just been rounded out. This index to the daily newspaper press is publisht monthly and in semi-annual cumulations at a price within almost everyone's reach—two dollars a year. (New York: R. R. Bowker Co.)

[9] *Prison Memoirs of an Anarchist.* By Alexander Berkman. New York: Mother Earth Publishing Association. $1.50.

Literary Notes

From Harper & Brothers we have received a new and pleasingly illustrated edition of *George Washington: A Biography* by Woodrow Wilson. (Pp. 333, $2.)

In Italy there has just been published a volume by the late A. Fogazzaro entitled *Ultime:* fragments of philosophical and critical thought on Tolstoy, De Amicis, the Brownings, and other writers.

An inseparable desk companion of ours is *Who's Who,* that comes to us now in the 1913 fashions—which are roomier than ever before. The new volume marks the 65th year of issue. In 1912 there were 2364 pages of biographies; now there are only 2225, but the pages are larger. (Macmillan, $3.)

Odd bits from odd corners of the world, a philosophical study, a reminiscence, a chance encounter, a coincidence, stories out of the way, often outré descriptions of almost unknown and little visited islands, furnish forth a volume as unrelated and inconclusive as its title: *Also and Perhaps.* By Sir Frank Swettenham. (Lane, $1.25.)

Another volume of chance paragraphs is *The Free Lance,* by Frederic Rowland Marvin. (Sherman, French & Co., $1.25.) Here we have comment more or less virulent on the passing show, stray jottings on themes of varied subject—political, moral, literary—interesting to read in some spectator's column day by day or week by week, but almost too ephemeral for preservation in a volume.

In *Paul the Minstrel and Other Stories* (Putnam, $1.75) Mr. A. C. Benson has reprinted several tales of a romantic nature which he wrote for his pupils when he was a master at Eton. Knights, heroes and hermits, all speak softly, think long and carefully, and act with caution and reserve. Such mild and gentle moral ideals must have made an excellent counterbalance to the boisterous spirit of Eton youths.

It is a favorable sign of the general interest in classical studies that a second edition is called for of T. R. Glover's *Virgil.* The author is University Lecturer on Ancient History in Cambridge University, and the twelve chapters, or lectures, treat with much learning and skill the personal history of Virgil, the literary source of his culture, and his interpretation of life, as shown in his treatment of Dido, of Aeneas, and the Greek and Italic gods. It is a weighty book and rewards study. (Macmillan, $2.)

The author of *Ways of the Planets* is known for her earlier volume, *The Friendly Stars.* In the later work she takes up the origin of the solar system, and the character and course of each several planet or asteroid, and treats the subject in a familier yet intelligent and trustworthy way. The book is useful for the general reader. (By Martha Evans Martin. 16mo, pp. 273. Harper, $1.25.)

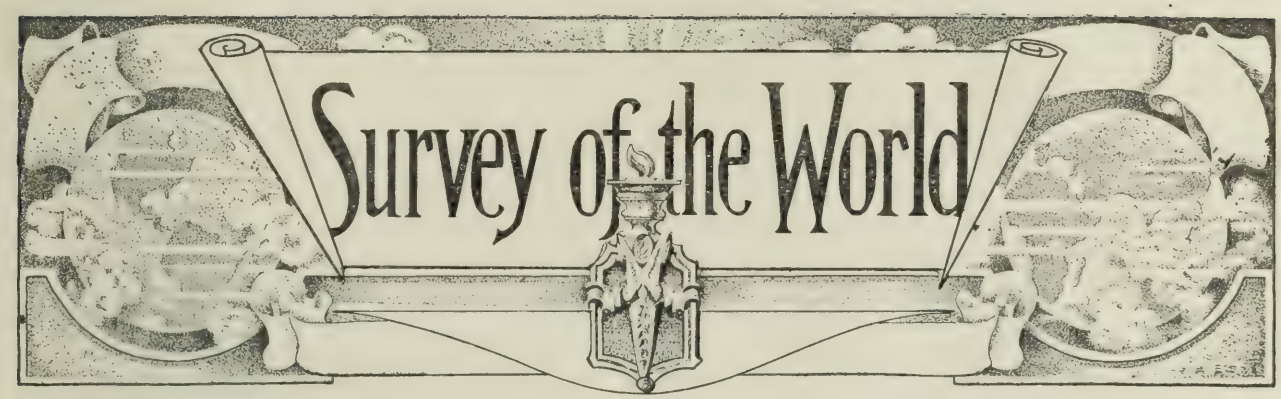
The hardened golfer does not give up his sport for every shower or haar, but there are some storms that keep him pent in club house, and at odd moments he will chuckle over the twentieth century Latin and Scottish-American humor of *Origines Golfianae,* or The Birth and Early Childhood of Golf, which Mr. Arthur V. Taylor "edits" for the Elm Tree Press of Woodstock, Vt. It is a pleasing little book, especially in the externals, and a rather diverting jest, especially in its etymologies (Caddie, from cadif, or cadifer—*cadum ferens,* or jug-bearer; links, from *linguax,* talkative; etc.) If the hoax seems to us less amusing than Mr. Pearson's *Old Librarian's Almanac,* from the same Press, that is, perhaps, because our mashie and niblick hang rusting on the wall.

Anatole France has written that "the slightest particularities of masterpieces are interesting"—and this fact is exemplified in the case of his own writings. Some time ago Jean-Emile Morel wrote in the *Grande Revue* of certain "sources" of the *Rôtisserie de la Reine Pédauque,* lately translated into English as *At the Sign of the Reine Pédauque.* Léon Carias carries these researches a stage farther. The earlier investigator unearthed a certain *Entretiens sur les sciences secrètes,* by the Abbé Montfaucon de Villars. M. Carias makes the interesting observation that Anatole France has read Bachaumont's *Mémoires,* Le Sage's *Diable boiteux,* Diderot's *Jacques le Fataliste,* Voltaire's *Candide.* Yes, and there is a work less familiar, too; the *Génies assistans et Gnomes irréconcilables ou Suite au comte de Gabalis,* by Father Antoine Androl, Celestine. "Sources of Anatole France, assuredly," comments the Paris *Temps;* "but, without Anatole France, they would have mouldered under dead leaves."

The author of *A Valiant Woman* (Crowell, $1), disguised under the initials "M. F.," offers in the form of a tribute to an early teacher some sharp criticisms of

present aims and methods in education. Lack of constructive ideas, however, defeats the exprest intention of making the book "a contribution to the educational problem," except by way of heightening prevalent discontent.

A translation of *Geoffrey Chaucer*, the study by Prof. Emile Legouis of the Sorbonne, is issued by Dutton (pp. xxxvi, 220; $1.50). The translation is the work of L. Lailavoix, who adds notes and a prefatory essay on the place of Chaucer in French literature. The frontispiece shows the portrait from the Occleve mss. M. Legouis is in America at this time, as Harvard's exchange professor. His introduction to the study of Chaucer is as commendable a work as we would naturally expect from the author of *The Youth of Wordsworth.*



There is a mass of information in the *Yearbook of Missions in India.* (London: Christian Literature Society for India.) It gives a comprehensive view of the mission activity as a whole, followed by particular accounts of each mission separately, and of all the educational, medical, industrial activities of all of them, concluding with the names and addresses of all the missionary workers. One learns that the Roman Catholic population of all India, Burma and Ceylon in 1911 was 2,191,362, and that of the Protestant churches 1,636,731. There is an admirable account of the growth of federation of the Indian churches and of the corporate union of some of them, all a movement of the last five years. A development of late years, likely to go further, is the mass movement in the lower castes to Christianity, especially in the Methodist and Baptist missions.

Cardinal de Richelieu: By Eleanor C. Price (McBride, Nast & Co., $3.25). A thoughtful, well proportioned and, what is of prime importance, *interesting* biography of one of the most romantic and fascinating figures in French history. It was in 1585, when Elizabeth was reigning at the height of her power in England, when Mary of Scotland languished in prison, when Philip of Spain was planning his Armada and Henry de Guise and the League held sway in France, that Armand Jean du Plessis, future Duc de Richelieu and Cardinal, was born. The biographer not only narrates the rise of Richelieu to power and wealth, but paints in broadly as a background to this commanding figure the social, industrial and political life of the Europe of that day. His pages contain innumerable anecdotes and character sketches.

There are many quotable bits in James Lane Allen's *Heroine in Bronze.* (Macmillan.) We read there this avowal:

> Tho a book lover, I collect no costly books, nor ever shall. Books to me are souls. Souls in this world must have bodies, and books must be bound. But my affection for a human soul goes out most freely to it when it is most simply drest. Can anyone love a monarch glittering on his throne? Let a king be uniformed like a common soldier; and if he is ever to win the love of human hearts, he will win it then—as fighting man and human equal. So a great book to me is no longer approachable, lovable, when swaddled in another man's tinsel. Why should a pilgrim, reverently on his way toward the soul of a book, be bidden to stop and worship its coat and pantaloons, designed by a nobody? Why set such antiquarian store on the vanities of any book-tailor? What was Aldus but a book-tailor? What was Elzivir but a costumer, to be ranked no higher than other designers of fashion plates? Who wants his Socrates tricked out like an actor strutting on the stage or incrusted like an archbishop overlording it at the altar? Who cares to have his light of the Gospels illumined by dark fingers? Let Horace be garbed in his poems for all time as what he was on his Sabine farm in his own day—a soul of unaffected gentlemanliness and fastidious simplicity.

Symbol and Satire in the French Revolution, by Dr. Ernest F. Henderson, is a work which is fairly well explained by the title. (Putnam, 8vo; pp. xxxii, 456; 171 illustrations.) Extended research must have preceded the compilation of interesting data and still more interesting plates. "The more one studies the period the more one finds what an immense influence was exercised by the teachings of Jean-Jacques Rousseau," observes the author. This is an old story. There is, for the average reader, a greater surprise in the prefatory statement that some, if not all, of the revolutionary art considered and reproduced by Dr. Henderson was issued "as a means of political propaganda, with the direct and avowed intention of influencing public opinion." Public opinion was excited against Tweed and Tammany Hall in the New York of Thomas Nast's day; a contributor to THE INDEPENDENT recently asserted that caricatures not only are one kind of history, as Emerson has said, but do actually make history. The latest historian of the French Revolution confirms this statement. The journal of France's National Convention asserts, indeed, that circulating such a cartoon as that representing the soldiers of despotism quitting their standards to enrol under those of Liberty and Equality was "one of the most efficacious means of instructing the hamlets and speaking to the eyes of the ignorant and unfortunate inhabitants." Perhaps it goes without saying that a spirit too definitely partisan usually fails to do artistic justice to its opportunities. Yet new light is certainly thrown on an old theme when we study the great revolution from the standpoint of graphic journalism.

International Friendship Societies

Next week Tuesday the Pilgrims Society will celebrate the 10th anniversary of its founding with a banquet at the Hotel Astor in this city. As the Pilgrims was the first society we believe to be established for the purpose of promoting international understanding, friendship, and peace between any two nations, this event is worthy of more than passing notice. There are really two Pilgrims Societies in existence. They are closely affiliated. One has headquarters in London, the other in New York, and for ten years they have held annual banquets from whence the most distinguished statesmen scholars and men of affairs have taken the opportunity to address the English speaking world on themes leading directly to a better Anglo-American understanding.

A young American lawyer, Mr. Lindsay Russell, of New York, conceived the idea of a Pilgrims Society while he was representing a New York law firm in London in 1902. He had the vision to see the good that would result from the founding of a society where leading English and American gentlemen could meet and consider ways of drawing their nations closer together.

Accordingly on July 11th, 1902, Mr. Russell invited a dozen or more Americans temporarily in London to meet at the Carlton Hotel, and a few days later a formal meeting of Englishmen and Americans was held. At this meeting Lord Grenfeld, the then Governor General of Malta, presided, and the organization was perfected. Thru Mr. Russell, who was made the Chairman of the Committee on Organization, and General Joseph Wheeler, Lord Roberts was invited to take the Presidency of the Society.

On August 8th, 1902, the eve of King Edward's coronation, a banquet was given in celebration of the coronation, Lord Kinnerd presiding. This brought together so many distinguished Americans and Britishers and attracted so much attention internationally that the success of the Society was thereafterwards assured. Among those who attended the banquet were Earl Roberts, Admiral Beresford, Lord Kelvin, Joseph. H. Choate, and Mr. Justice Brown of the United States Supreme Court.

In January, 1903, Mr. Russell returned to New York with a letter from the Archdeacon of London to Mr. J. P. Morgan and also to Bishop Potter. The latter took an active interest in the formation of the Pilgrims in New York, and at a meeting held at the Waldorf on January 13th, Bishop Potter presiding, the organization was completed with Bishop Potter President and Lindsay Russell Chairman of the Executive Committee. Such men as Grover Cleveland, William Butler Duncan, August Belmont, General Wood, General Wheeler, General Young, Mark Twain, Myron T. Herrick, Richard Mansfield, and Frank Munsey were charter members.

Both the London and the New York Societies are now in a highly flourishing condition. They have a thousand or more paying members and no more brilliant or politically important functions are given in New York or London than their annual banquets. Mr. George T. Wilson, one of the Vice-Presidents of the Equitable Life Assurance Society, has now been the guiding spirit in the New York society for the past few years and the present success of the organization is due largely to him. Mr. Harry Brittain deserves credit for the English society's present flourishing condition.

Since the Pilgrims were founded numerous societies have sprung up, aside from the distinctively peace organizations, for promoting closer international relations. In Europe perhaps the most important are: The Latin Union and the Franco-Italian League of Paris, the Anglo-German Friendship Committee of London and Berlin, and several societies to promote closer relations between France and Germany and Austria

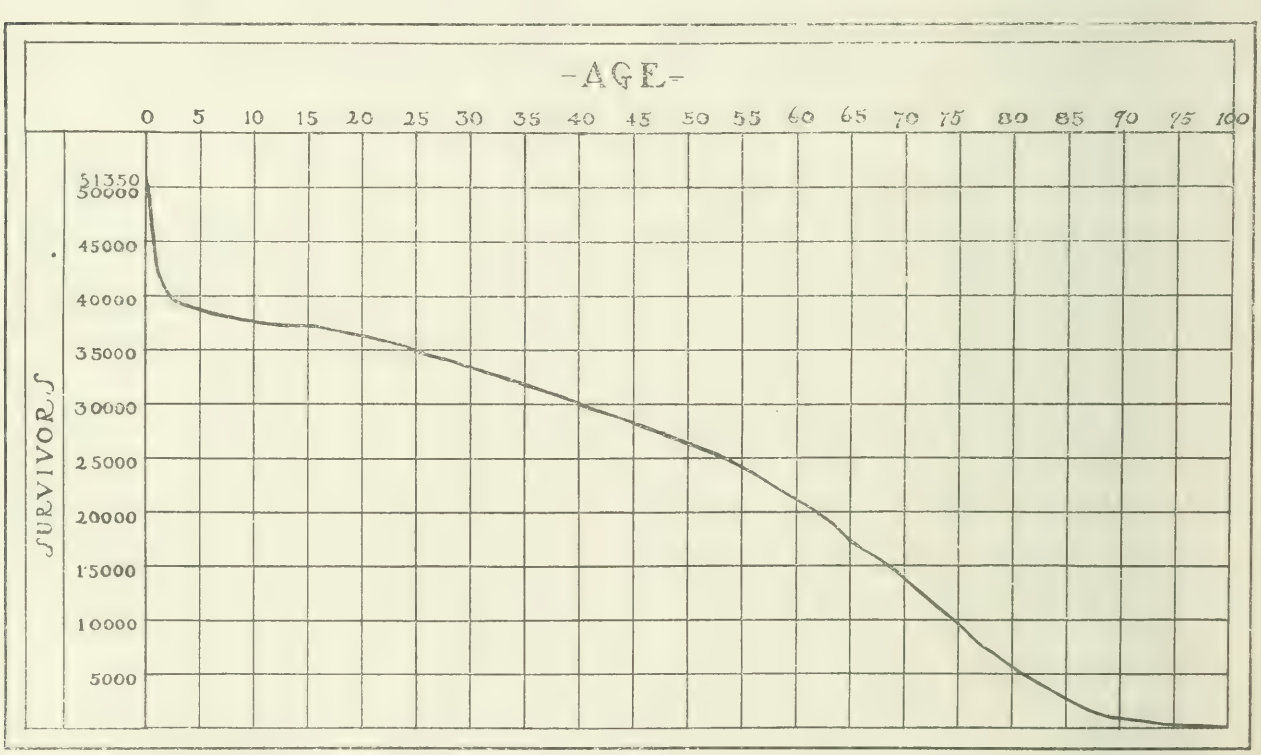
and Italy. Here in the United States the Japan Society (also founded by Lindsay Russell) is the most active and important of all. Not only does it entertain distinguished Japanese who may visit our shores, but it arranges lectures and exhibits, etc., and even sends a yearly lecturer to Japan.

Other organizations are the American-Scandinavian Foundation, which has an endowment of over half a million dollars, the American-Scandinavian Society, the Alliance Française, the National German-American Alliance, the Latin-American Society and the Mexico Society.

Duration of Life

Mankind has always been impressed with the uncertainty of human life. This is true for the individual, and yet there is nothing in the realm of vital statistics which is more certain than the average duration of life when a large number of individuals are considered. In fact, it is upon the possibility of determining in advance with considerable accuracy the remaining years of life when thousands of individuals are considered that life insurance rests.

In the lower half of this page is given a graphic representation of survivorship according to the Massachusetts Life Table for males. In 100,000 births there are 51,350 males. At the end of the first year after birth only 42,501 are living and their number gradually diminishes until at the age of 100 only 19 remain. The probable duration of life means the age at which a number of individuals of equal age will be reduced by death to one-half. In the table before us half of those who were born are living at about the 51st year. The expectation of life of these same persons was, however, only 46.6 years at birth.

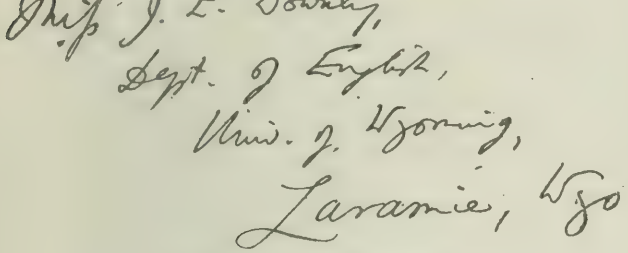


It is possible for a male at any age to estimate the probable duration of life by determining the age at which one-half of those of the same age as he shall have died. Thus at the 40th year there were about 30,000 survivors. This number is reduced to 15,000 at about the 68th year. This curve gives with reasonable accuracy a picture of survivorship in this country but a few years ago. As a result of preventive medicine the curve is being gradually raised thruout its entire length. The curve is the steepest in the first years of life.

W. B. Bailey.

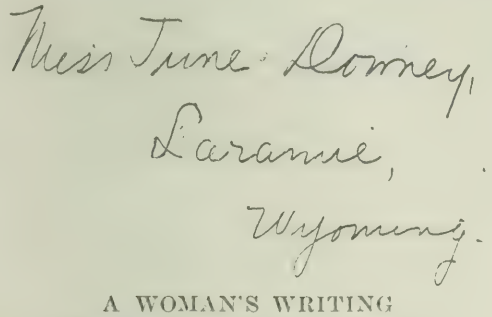
Sex and Handwriting

The recent attempts of science to determine with precision the mental differences between the sexes, altho likely to deprive us of a source of humorous literature, bids fair to issue in conclusions of value.



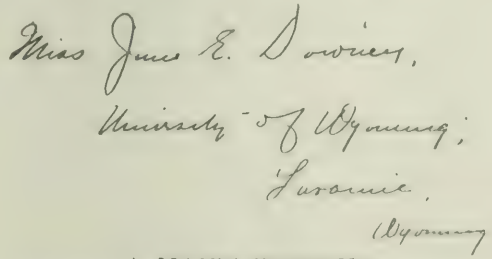
Handwriting raises the question of sex differences in particularly interesting form. Does sex reveal itself in handwriting? How determine the answer? Not, of course, by deference to any one man's opinion, but by counting his successes and those of other men in distinguishing a man's from a woman's writing in a long series of trials

Graph showing the number of survivors, at various ages, of the males of 100,000 births.



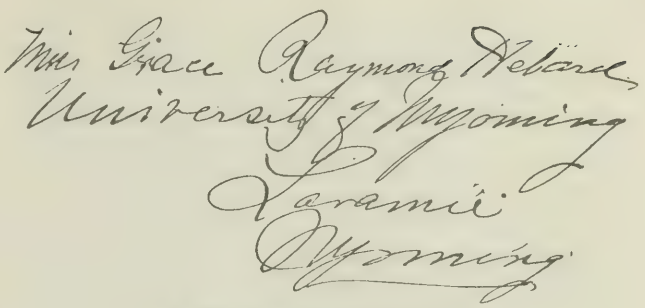
made under standard conditions. In the long run every one has a chance of guessing right in fifty out of a hundred cases, since the sexes are but two in number. Binet and other French investigators have, however, found that most judges are right in some sixty trials out of a hundred, and that the expert may, under very favorable conditions, be right ninety times out of a hundred. Handwriting, then, reveals sex to the expert observer, but with a wide margin of error.

Further investigation shows that there are certain hands called masculine by every



A MAN'S WRITING
Recognized as that of a man.

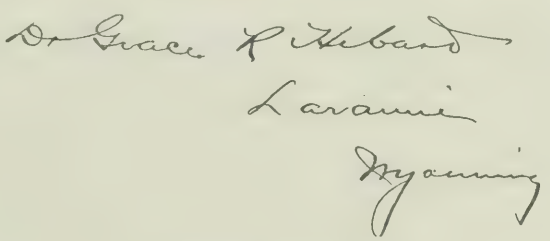
observer; others called feminine; still others are ambiguous in sex-reference. The signs of masculinity appear to be boldness, unconventionality, forcefulness. The feminine hand is characterized by neatness, unaccustomedness, conformity to chirographic



A WOMAN'S WRITING
Recognized as that of a woman.

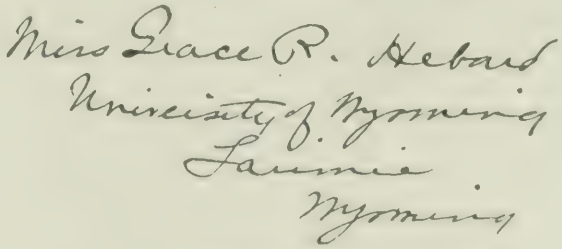
standards. The ambiguous, or sexless, hand is small, supple, rapid. Are such graphic traits, then, significant of sex-differences with a question mark for the sex-character of the writer of the ambiguous hand?

A MAN'S WRITING
Commonly taken for that of a woman.



Unfortunately for such a comfortable conclusion, many masculine hands are found to

A WOMAN'S WRITING
Commonly taken for that of a man.



have been written by women, many feminine hands by men! The samples given show such inversion of signs. Modern psychology recognizes, it is true, the possibility of a man or woman bearing the imprint of the opposite sex, with curious consequences, but it is improbable that such an explanation holds for the many cases of inversion of sex-signs found in penmanship.

Environment appears responsible for much of the so-called sex-difference in handwriting. Thus the women who write a man's hand are apt to be those who lead a

A MAN'S WRITING
Here the sex-signs are ambiguous.

professional or literary life or have had much practice in the art because of age or experience; the men who write feminine hands are for the most part teachers—a

A WOMAN'S WRITING
The sex-signs are here ambiguous.

profession which encourages conventionality—or else are those unaccustomed to much writing.

Such an investigation shows thruout the influence of social pressure upon the judgment of the individual on the sex question. There is found a bias toward excess of judgments in favor of the masculine hand so as to include in such a category all samples characterized by individuality, energy, rapidity. As a consequence more women are

found writing a masculine hand than men writing a feminine one, a fact which, reduced to quantitative form, would give us a definite statement of the amount of social bias present in judgments on sex-differences.

JUNE E. DOWNEY.

Eyes That Stick Out

Eyes carried upon more or less flexible arms or stalks extending out from the head are well known among crabs, deep-sea fishes and land-snails, which last can draw them down inside the stalk and pull the stalks in after them, when harm is threatened, as one might invert the finger of a glove into its palm. It has remained, however, for a little darky in Natal to discover an insect with this ocular arrangement—eyes that really "stick out." It is a small fly (Diopsis apicalis) which has its compound eyes mounted upon rigid stalks, the ends of which are as far apart as the whole length of the body. A further point of interest is that these eye-stalks bear the antennae, which are short and only three-jointed, but terminate in a long hair, which probably serves, like a cat's whisker as a feeler against contact with obstacles. Such a guard seems needful in this case, as the insect can have little view straight ahead. The fly's habits are unknown, except that its captor reported that it was plentiful, resting on blades of grass; but the little darkies' guess that it had that kind of eyes to enable it to look around the edges of the blades was thought too simple for science!

STALK-EYED FLY

Studies of Radium

In Professor Rutherford's new edition of his *Radio-active Substances and their Radiations* we have an admirable presentation of the discoveries and conclusions reached during the last six years on the subject of radio-activity. All chemical study is now focused on this department, because it has so revolutionized our ideas of the atomic constitution of matters, and seems to make possible some of the dreams of the old alchemists. This branch of the science is still so much in the flux that it is a favor to scholars to learn what are the conclusions of the man who has done more to investigate it than any other one since Madame Curie's great discovery of radium. The great peculiarity of radio-active substances like uranium or thorium is that they disintegrate giving out emanations; the atoms bursting and sending out emanations which are other simpler elements not existing as such in the parent atom. One of the first of these emanations to be discovered proved to be radium, first found spectros copically to exist in the sun, but since found on the earth. Rutherford tells us that when the emanation breaks out it actually causes a recoil in the parent particle, and that this gives us a way of calculating the atomic weight of many substances existing in so small quantities that it cannot be measured by the balance or any other way. He believes that Madame Curie actually succeeded in getting metallic radium, and he describes it as a white metal far more volatile than barium, and having a melting point of about 700° Centigrade. The period at which it takes radium to exhaust itself by its emanations he puts at about 1750 years. He does not consider Sir William Ramsay's "transmutation" hypothesis as yet proved, and states that "there is so far no good evidence that the ordinary inactive chemical elements can be transformed by the radiations from active matter." Yet he believes that the study of the uranium minerals and their atomic weights makes it almost certain that lead is the final product of uranium, an investigation which Madame Curie is now carrying on. He does not regard bismuth, as was once thought, the product of thorium, but thinks there may be two end-products of thorium not yet ascertained. Very interesting is his suggestion as to the constitution of the atom. He figures it as having a cone of positive electricity surrounded by a distribution of negative electrons to make it neutral, which is almost the opposite of which Lord Kelvin and Sir Joseph Thomson imagined it to be.

Snails Useful in Orange Groves

One of the many pests against which growers of oranges and lemons in Florida must contend is the sooty mold—a fungus which overspreads leaves and fruit to the great injury of both the tree and its product. It has now been found that a snail, which lives on bushes in the southern part of that State, is highly efficient in removing thin mold, upon which it feeds greedily. It has an elongated spindle-shaped shell characteristic of the genus Bulimulus, of which it is a member, and is most common in the hammock-groves of Manatee and Miami

counties. Where abundant this snail will free a whole orchard of the black disfiguring mold, eating it off so thoroly as to leave the fruit-rinds bright and glossy. Indirectly it acts as a check upon the worst of orange-pests, the white citrus-fly, one of the plant-lice. Orchardists are therefore encouraging the snail and its multiplication by placing straw on the ground about each tree, and hanging pieces of burlap in the crotches, to protect its eggs from birds and other natural enemies.

Joseph and His Brethren

The drama which originated in the effort to make real the stories of the sacred books, classical and Christian, is returning to its early task after the long alienation of the puritanic regime. Wallace's *Ben Hur* and Sienkiewicz's *Quo Vadis* provided the material for spectacular plays dealing with the New Testament period. Wright Lorimer toured the country for years as David in *The Shepherd King*, and from Old Testament storehouse comes also a new play of a much superior sort produced at the Century, the old New Theater, in New York.

The author of *Joseph and His Brethren*, Louis N. Parker, has proved himself able to do many things well. His *Pomander Walk* was a delightful bit of old-fashioned English life. His *Disraeli* brought to life again the great premier at a time when England was feeling the need of a man with a strong foreign policy. His *Drake* of last year assisted in forcing the British government to enlarge its naval program by reviving the memories of the days when England dominated Panama.

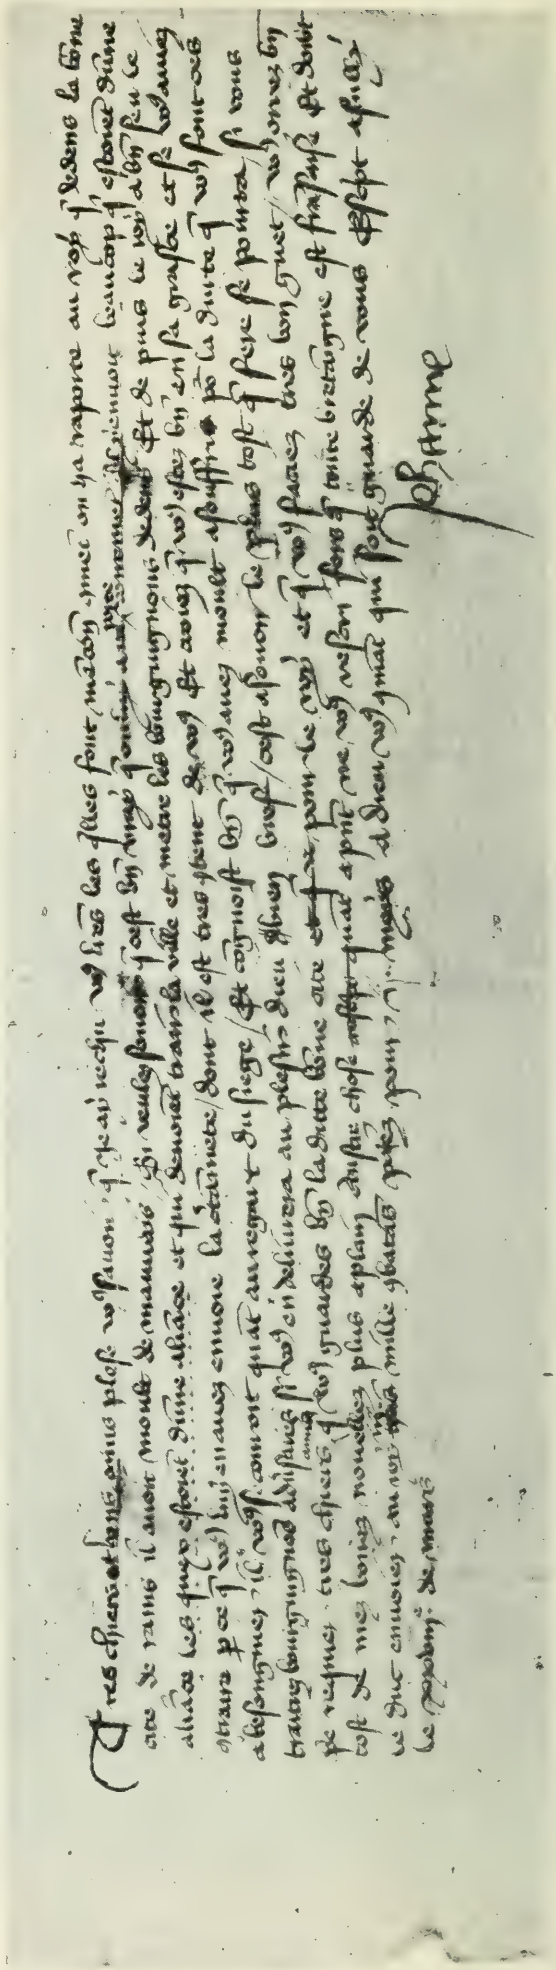
Joseph and His Brethren is what he says it is, "a pageant play." The scenery receives more applause than the actors, and the crowds which fill the background of many of its thirteen scenes are handled and grouped in excellent taste. For the plot it was not necessary to go outside the scriptural narrative, for there is no more dramatic story in the world than that of the slave who became ruler and heaped coals of

JOSEPH IN PRISON

A scene from Louis Parker's new play. Joseph interprets the dreams of the chief butler and chief baker, foretelling the latter's restoration to office and the latter's death by hanging within three days.

fire upon the heads of the enemies of his own household. The story tho ancient is not antiquated, for democracy is as fickle as any Pharaoh, always ready to reward the interpreters of its dreams and giving high office to those who promise to secure cheaper food.

There is also more of modernness than one might expect about the scenes. Zuleika and the ladies of the Egyptian court walking about in dresses as straight and tight as umbrella cases might well have stepped off the monuments of Karnak—or off the pages of the latest French fashion book. The dancing before Pharaoh is so much like that which may be seen nowadays at roof gardens and cabarets and is so near to the genuine antique that a Sunday school superintendent will hesitate to advise his flock to see the play. Except for that and for the unnecessary exaggeration of the role of Potiphar's wife, *Joseph and His Brethren* may be commended to young and old as a beautiful example of the new art of historic pageantry, for the moral of the story shines thru the splendor of its new setting.



Jean and Jeanne

Celebrations of two absorbing personalities—Jeanne d'Arc and Jean-Jacques Rousseau—demonstrate how diverse are the inspirations of French history. The latter demonstration is that of the Genevese Société J. J. Rousseau, and took the form of an Iconographic Exhibition in connection with the great rhetorician's recent bi-centenary. The Society, drawing upon its own resources and those of the Geneva university and various museums and collectors, brought together portraits, engravings, and lithographs of artistic as well as historical interest. Most properly, too; for does not Jean-Jacques write in his *Confessions*:

> The colored plates of our geometricians had given me a taste for drawing; accordingly I bought colors and began by attempting flowers and landscapes.

Does he not also make it clear, in *Emile, or Education,* that he could no more tolerate the "imitation of an imitation" in art than in life itself? England's Ruskin boasted that he was of Rousseau's school. And Rousseau was a consummate artist in his favorite medium: words.

Jean-Jacques is the hero of radical France; Jeanne d'Arc the heroine of Catholic France. Nor have the partisans of the one much use for those who espouse the other's cause. Does not the critic Sainte Beuve write that intolerance is the French fault *par excellence?* a trait due, as Professor Babbitt says in his *Modern French*

A LETTER BY THE MAID OF ORLEANS

The text is supposed to have been dictated by Jeanne and signed by her. There exist three letters signed by her and two more of her dictation.

Criticism, to the Frenchman's tendency to carry to an excess his virtue of logicality, and then to put emotion into the service of his logic. Now Jeanne came into the world one January day just 501 years ago; and New Yorkers (permanent or transient) have an opportunity to see an exhibition of her memorials held in the building of the American Numismatic Society, next door to the Hispanic Museum, and the new Spanish church. What lends the exhibition a certain permanency of value is the circumstance that its organizers are working for the erection of a statue of the Maid in New York City. The objects which they show number about a thousand: statues, paintings, medals, photographs, coins, etchings, engravings, manuscripts, posters, play-bills, postage-stamps, books, etc. Already the committee in charge has collected $17,000 for its statue—but money is not all. Public interest and the interest of American artists is invited by the exhibitors, and the invitation has been accepted with a will. In working for the statue, the twentieth-century friends of Jeanne are thinking, they declare, of a monument to neither religion nor the suffrage; only to the highest type of womanhood—to her who repeated the words of her Voices, "*Audacter!* Work, and God will work!"

The friends of Jeanne, like some of Jean's best friends, are friends of the ideal. The ideal of Jeanne was the service of God and King—for King stood for State; the ideal of Jean, to secure the rights of man. Are the two ideals as incompatible as the modern Frenchman thinks?

What Congress Is Doing

Tariff hearings have been in progress before the Ways and Means Committee. There are indications that lumber, cattle and meats will be placed on the free list in the committee's bill, and that only a very small duty on cheap cotton goods will be retained. Testimony was taken as to a kind of Trust which is said to control the sale of California lemons. It was admitted by an officer of the only American aluminum manufacturing company that the world's output is controlled by an international agreement. This company owns a Canadian company, which has an agreement with the six or seven foreign manufacturers. Chairman Underwood said the committee's aim was to make a reasonable competitive tariff, with due regard for revenue.

The votes of the Presidential electors have been received by the Senate, as follows: Wilson, 435; Roosevelt, 88; Taft, 8. Senators Nelson, of Minnesota; Kenyon, of Iowa, and Owen, of Oklahoma, have been re-elected. There have been the following additional elections: Tennessee, John K. Shields, Democrat, chief justice of the State's Supreme Court; Rhode Island, L. B. Colt, Republican, who is now a Federal judge and has been on the bench thirty years; Nebraska, George W. Norris, Republican; Oregon, Harry Lane, Democrat; Maine, E. C. Burleigh, Republican; South Dakota, Thomas Sterling, Democrat; Idaho, James Brady, Republican. The Democratic party now has just half of the coming Senate and hopes to add one or two when the six remaining vacancies are filled.

In the Senate, last week, Mr. Root spoke at length concerning the Panama canal tolls controversy, saying that we should either submit the dispute to arbitration or repeal the exemption of our coastwise shipping. A provision of the pending Immigration bill, requiring citizens or subjects of any country which issues certificates of moral character to produce them before admission was vigorously opposed and has been dropped by the Conference Committee. In the House the bill for the Rockefeller Foundation of $100,000,000 has been pased. Among those testifying before the

Money Trust Committee last week was Henry P. Davison, managing partner in the firm of J. P. Morgan & Co. Trusts, he said, had been a blessing. To forbid interlocking directorates would set the country back twenty years. There was no Money Trust. Concentration in New York was due to economic conditions and the lack of a good national banking and currency system. The New York Stock Exchange defended itself in an elaborate statement, which includes the assertion that the Federal Government has no power or authority to regulate the Exchange.

The Senate has passed a bill providing that in suits brought under the Anti-Trust law all testimony shall be taken in public. This was suggested by the course of the Federal Court in Boston, in the case against the Shoe Machinery company, testimony in that suit having been taken privately, in chambers. A House committee asserts, in a report, that Senator Warren, now seeking re-election in Wyoming, by means of a live stock company unlawfully fenced in and occupied, in 1906 and thereafter, 47,000 acres of public land.

In the Realm of Insurance

By W. E. Underwood

Arson and Fire Insurance

Mr. George H. Holt, of Chicago, manager of the Policy Holders' Union, writes a rejoinder to our article, "Is There an Arson Trust?" which appeared in this department on January 16. We subjoin his communication and our reply:

Accepting the invitation published in THE INDEPENDENT, permit me to ask whether you are willing to be taken seriously when you say "The number (of insured risks) which get to the state of losses (is) comparatively insignificant." If your readers follow your judgment will they not be led into error by that statement?

The public is being educated to think that fire losses of two hundred and twenty-five million dollars a year is something frightful—not "insignificant." They are being urged and even compelled to expend money in large sums to reduce that waste and its train of attendant evils. If any considerable portion of that waste is chargeable to arson is that fact insignificant? There is no room to question the fact that arson and incendiarism are important factors. Underwriters unanimously agree upon that fact. The existence of State Fire Marshals, and the records of the courts are a proof of it.

If any practice of "the men who direct our fire insurance companies" is responsible for a considerable share of it, does not that fact of itself "impeach either the integrity or the business acumen" of these men? A very slight acquaintance with current events will furnish convincing evidence on that point. Fire Marshals and underwriters agree that over-insurance is coincident with a large percentage of suspicious fires. The records of insurance adjustment bureaus confirm that opinion. Your own New York (Merritt) Legislative Committee prints pages of evidence which fastens the blame for over-insurance upon the "greed" of the companies for volume of business, and upon the agency system which makes hazards and high premiums a source of easy and extra profit to the agent, and (excluding conflagrations) to the companies. The same state of facts has been found by other legislative committees who have investigated the subject, such as Wisconsin and Illinois. To underrate the importance of Chief Johnson's "Arson Exhibit" is to be out of line with the "General Will," which your magazine voices with such telling effect in the same issue with this "Arson Trust" article. If the remedy proposed by him is not wise or adequate, why not suggest a better one?

Arson is too real a peril to be sneered at. Let the companies try this simple remedy, and at least one great stimulant to over-insurance will disappear. Instead of pre-inspection of every risk by a company inspector, require the agent or broker who accepts the risk to warrant that he knows the owner and the property and that in his judgment the owner is worthy and the insurance is not in excess of the insurable value, and that if further investigation, either before or after the fire, shall show that the property was over-insured, such agent or broker will forfeit or refund all of his commission or profit upon that transaction.

Admitting that this would be a radical change from existing conditions, the question is, what would be the result, or effect, of this change? Reckless and criminal insurance would be very unpopular with agents and brokers. It would not "look good." No honest owner would go without insurance (tho it might be in a different company), and the property and lives of innocent and helpless persons, now imperiled, would be safeguarded.

In addition to that, the decrease in fire waste would lead the way to a general decrease in the cost of insurance and of fire-fighting. The only thing that stands in the way of this accomplishment is the "greed for business" on the part of the "men who direct our fire insurance companies." Each man wants it for his particular company. That is the whole thing. Is not that an "impeachment of their integrity or of their business acumen?" Your own statement that there is "no one else upon whom any expense can be put" except the insured, justifies the Arson Exhibit, does it not?

Chief Johnson's printed report of "Incendiarism," and his replies to criticisms by Secretary Robb and Manager Shallcross are very convincing as to the facts, as to some of the causes and as to their great significance and the crying need of reform, at least to those who pay the costs.

Very cordially yours, GEO. H. HOLT.

Chicago, January 20, 1913.

We were not discussing the fire waste of the United States in the article from which Mr. Holt quotes and, therefore, he does not address himself to the proposition he challenges.

We are going to admit at the outset that a small proportion of the population of the United States is composed of persons capable of committing, and who do commit, the crime of arson. We admit to the belief that most, and perhaps all, of these persons burn their property for the insurance on it. We admit the existence of a comparatively small number of dishonest insurance agents and brokers, capable of issuing, or procuring, insurance in excess of the values insured. We are prepared to admit that a few companies of inferior quality may blink the moral hazard side of their business.

But these admissions do not prove that a considerable portion of the country's annual fire waste is due to arson, or that the rank and file of agents, brokers and companies through greed, neglect, or incompetency are responsible for the work of the incendiary.

No one will deny that the destruction of values wrought annually by fire in this country is a national disgrace. We have not asserted that the yearly annihilation of 225 million dollars worth of property in the United States is an insignificant matter; nor is there any connection between that subject and our previously expressed disbelief in the absurd charge of New York City's Fire Commissioner that twenty-five per cent of the fires, involving four millions of loss per year in that city, were due to incendiarism, and that the fire insurance companies were mainly responsible for the conditions.

Mr. Holt asks if we are willing to be taken seriously when we say that the number of insured risks which get to the stage of losses is comparatively insignificant. Yes. Why not? Isn't it true? Could insurance exist as a practicable institution if it were not true? Does he wish his readers to conclude that he believes that the number of insured risks which are damaged, wholly or partially, by fire amount to a substantial proportion of the whole?

We were alluding briefly to the cost involved in inspecting all risks before policies were issued on them, as against the present practice of the companies in depending on investigation of the losses after they occurred to defeat fraudulent claims. The fair conclusion was that the latter method was the more economical. Why? Because the number of risks insured is large; the number which suffer damage by fire, comparatively insignificant. This is not asserting that the number of fires involving an insurance loss is not too large; it is not saying that the amount of the annual fire waste is insignificant; and it is in no way related to Mr. Holt's hypothetical question: "If any considerable portion of that waste is chargeable to 'arson' is that fact insignificant?" We don't know that any considerable portion of it is chargeable to incendiarism, and we won't know until he tells us how much he thinks "any considerable portion" aggregates.

Mr. Holt, resorting to hypothesis again, asks: "If any practice of 'the men who direct our fire insurance companies' is responsible for a considerable share of it, does not that fact of itself 'impeach either the integrity or the business acumen' of these men?" If we do not misconstrue this question, the managers are here charged by innuendo with being responsible for a considerable share of the incendiarism prevalent in the country, proof of which, he says, lies in "a very slight acquaintance with current events . . . on that point." The evidence seems unconvincing.

Admitting that over-insurance is coincident with a large percentage of suspicious fires, does that impeach the integrity and business acumen of the men at the head of the companies? Does any one believe that they, driven by greed for volume, load up with liabilities that will induce the criminally inclined to fire their property for the profit such a transaction will yield? Are not insurance presidents, secretaries, general agents, local agents, of average honesty and respectability? People who know them intimately seem to believe they compare not unfavorably with men in other lines of business.

Of course, there is over-insurance and there will be always. It is due to two general causes: deliberate dishonesty on the part of a very small portion of the whole number of insured persons; and, the normal reduction of original values insured, consequent upon natural fluctuations of business, unattended by a simultaneous proportionate reduction of insurance carried. If over-insurance through the latter cause is worthy of serious reprehension, then we will find on investigation that leading business men of the highest character all over the country have been included in the list of offenders. But experience does not teach that the loss ratio of the companies has been measurably affected by the fact.

Mr. Holt is neither just nor forceful

when he observes that "Arson is too real a peril to be sneered at." No one has assumed that attitude towards it. That it has been condoned at times by neighborhood juries, when fire insurance companies were the victims, is admitted. Now, as to the remedy he proposes: Suppose the conditions named were a part of the practice, and that at the time the insurance was effected the agent or broker could, so far as his knowledge extended, certify to the worthiness of the applicant and the sufficiency of his values, and that both the character of the insured and the value of the property underwent material depreciation after the insurance was secured, of what practicable value would be the remedy?

It is reasonable to believe that, taken as a whole, the great body of fire underwriters is composed of men of at least average honesty, and that their interest in the general welfare is equal to that of any other class of citizens. It must be admitted that their experience in the fire insurance business exceeds that of any other set of persons in the country. Then, if they possess average honesty, equal patriotism and superior underwriting ability, they cannot be the offenders Mr. Holt describes. Not only are they not, but their record in the work of reducing the fire waste, in securing proper building laws, adequate water supplies, well equipped fire departments, and in every enterprise that makes for reduction in hazards and decrease in insurance cost, is a matter of public knowledge.

The Continental

This company is notable in financial circles for the skill possessed and exercised by its management in making investments and for the large proportion of its assets which are represented by bond and stock securities of the first class. Of the aggregate assets shown by the balance sheet at the close of business December 31, last, amounting to $27,070,031, the sum of $22,282,237 is in railway, municipal and bank securities of the first order. Amongst insurance people another fact about the Continental's financial showings yearly is that the values of its securities are generally appraised at figures allowing a comfortable margin and that its stated surplus may easily be counted as very much greater than shown on the face of the account.

In addition to the bonds and stocks mentioned, it has real estate, $1,175,000; collateral loans, $500,000; premiums in course of collection, $1,193,489; interest, rent and dividends accrued, $209,475; and cash on deposit and in office, $1,707,130.

The unearned premium reserve constitutes the largest item in the schedule of liabilities, at $9,022,218; then follow, losses in process of adjustment, $485,205; all other claims, $322,618; reserve for dividend, $500,000; reserve for contingencies, $250,000; capital stock, $2,000,000; total liabilities, $12,580,040; net surplus, $14,489,991. This gives the policyholders a surplus security consisting of the net surplus, the capital and the contingency reserve, a total of $16,739,991.

National Life of Vermont

Reviewing the progress made by the National Life Insurance Company of Montpelier, Vt., during 1912, as recorded in its financial exhibit at December 31, we find the following gains in leading items: assets, $2,593,578; policy reserves, $1,933,237; surplus, $311,894; outstanding insurance, $6,785,952; dividends paid policyholders, $160,036; total paid policyholders, $480,572. These figures represent net betterments over the work done in 1911.

The company closed the year with $56,038,868 assets, $42,390,723 policy reserves; $6,886,640 surplus and $179,464,607 outstanding insurance. It paid policyholders $1,038,906 dividends and a total of $5,395,798. It issued $20,385,031 of paid-for new insurance, which was $2,310,129 more than the amount issued in 1911. Since organization the aggregate benefits paid to members is $59,219,806.

Granite State Fire

In spite of the unfavorable conditions which prevailed in the business of fire insurance during 1912, and of the general depreciation in securities on statement day, Dec. 31, the annual financial exhibit of the Granite State Fire Insurance Company of Portsmouth, N. H., shows a satisfactory gain in total assets and net surplus. The assets, aggregating $1,160,352, are larger by about $25,000 than at the beginning of the year, while the net surplus, $331,905, shows a gain of about $20,000. The Granite State's surplus as regards policyholders is $531,905.

Financial

Oil Dividends and Prices

Additional extra dividends were declared last week by Standard Oil subsidiary companies. The Indiana Company, which increased its capital stock in March last from $1,000,000 to $30,000,000 by a stock dividend of 2900 per cent, added an extra of 4 per cent to its regular quarterly of 3 per cent. Its extra dividend in November was 7 per cent, and the total since the dissolution of the Trust, about one year ago, has been 20 per cent upon the new capitalization of $30,000,000. The Kansas company added 4 per cent extra to its quarterly of 3 per cent. Since dissolution, the 33 subsidiaries and the original central company have declared and distributed in dividends, $60,800,000, or the equivalent of a little more than 60 per cent upon the capitalization of the old Trust, whose dividend maximum, in its best year, was 48 per cent, the total falling to less than 40 per cent in the year immediately preceding the dissolution order. With the recent large dividends, the market prices of the shares of the subsidiaries have advanced, and, in some instances, are very high.

We recently referred to the increase of the wholesale price of gasoline from 9 to 17 cents in the year 1912, and to an addition of 50 per cent to the price of kerosene in the same year. A representative of the Standard Oil company now asserts, in a publisht statement, that the advance has been due to a world-wide increase of demand, higher cost of crude oil, and diminishing output of those kinds of crude from which gasoline and kerosene are derived. The output of crude in this country last year, he says, was 220,200,000 barrels, or 200,000 less than the quantity produced in 1911. Prices of crude have been increased, he adds, by 54 per cent in Pennsylvania, 60 per cent in Kansas and Oklahoma, 57 per cent in Illinois, and 15 per cent in Texas. We presume there are many persons who believe that the dissolution was ineffective, and who will persist is seeing some connection between the higher prices and the great dividends.

The Beef Supply

Official statistics throw some light upon the conditions which have increased the price of beef. Reports of the Department of Agriculture show that the number of cattle on farms in this country declined from 72,500,000 on Jan. 1, 1907, to 58,000,000 at the beginning of 1912, although farms were encroaching upon range area. But the population was growing in those five years. One Western expert says that since 1900 the beef cattle supply has been reduced by 28 per cent, while the increase of population has been about 25 per cent. Prices have risen in obedience to the law of supply and demand.

Decrease of supply has cut down our exports. Only 33,000 cattle were exported last year, their value being about $3,000,000. The number exported in 1911 was 164,000, valued at $14,000,000, and a steady decline is shown since 1904, when 599,000, or $41,000,000 worth, were shipped. There has been an increase of imports. Last year, more than 300,000 cattle were brought into the country, but only 16,000 were imported in 1904. Last year's exports of fresh beef were only 9,000,000 pounds, against 29,000,000 in 1911, 156,000,000 in 1908, 270,000,000 in 1906, and 354,000,000 in 1901. Such figures as these must be taken into account when the cause of the increase in the cost of beef is sought.

Last Year's Foreign Trade

Our foreign trade last year surpassed all previous records, the sum of exports and imports exceeding the sum in 1911 by nearly $600,000,000, and for the first time rising above the four billion mark. Following are the official figures, publisht last week by the Government:

	1912	1911
Exports	$2,399,995,973	$2,092,373,141
Imports	1,817,662,340	1,532,931,861
Total	$4,217,658,313	$3,625,305,002

The figures of the last two decades show remarkable growth. Exports were only $824,860,000 in 1895, and they crossed the billion line in 1896 for the first time. Imports have been doubled in eleven years.

The Bankers' Trust Company has adopted a pension plan, like those of the First National Banks of New York and Chicago, and has appropriated $75,000 as a nucleus of the fund. Membership will be voluntary. Employees who become members will contribute 3 per cent of their salaries, and fifteen years' service must precede a pension benefit.

VOLUME 74 NUMBER 3349

The Solution of Industrial Peace

A great industrial war is now being waged in the garment trade in New York City. The papers are full of the violence and recrimination of it, and the attention of the country has been caught. How many realize, however, that in certain branches of this industry a plan for industrial peace has been worked out and put into operation that bids fair to solve the whole labor problem? Let us explain.

The needle-work industry is first in importance of all the industries in New York. It is separated into two great divisions—women's wear and men's wear. These two divisions are subdivided into smaller branches.

In the men's wear division the United Garment Workers of America represent the workers, while the United Merchants and Manufacturers' Association, the United Contractors and the New York Clothing Trade Association are the three organizations that represent the employers. The 110,000 wage earners, now on strike, demand a 48-hour week and a 50% increase in wages.

In the women's wear division there are about 120,000 workers represented by the International Ladies' Garment Workers' Union. They are engaged in six trades which manufacture cloaks, suits and skirts, dresses and waists, tailor-made suits, white goods, misses and children's wear, and wrappers and kimonos.

The three first of these trades have adopted what is known as the "Peace Protocol"; the dress and waist branch only within the past few days. The three last trades are now on strike primarily to obtain this "protocol." What is the protocol?

After the bitter strike in the summer of 1910 in this city, between the Cloak, Suit and Skirt Manufacturers' Protective Association and the Joint Board of the Cloak and Skirt Makers' Union, a protocol or treaty of peace was established, the most significant features of which were the creation of three new agencies for promotion of industrial peace—namely the preferential union shop, a Board of Sanitary Control and a scheme of adjusting all disputes by arbitration.

The preferential union shop was designed to settle the demand of the manufacturers for an open shop and the unions for a closed one. Under this plan the employers must maintain union hours and a minimum wage and give the preference in employment to union men. The unions on their part must maintain discipline among their members and see that they live up to the protocol. Thus the employer recognizes and encourages the union and the union opens its membership to all workers.

The joint Board of Sanitary Control consists of two members representing the employers, two representing the employees and three representing the public. It is presided

over by Mr. William J. Schieffelin, one of the best known and most useful public spirited citizens of New York. The Board has full power to standardize sanitary conditions in the shops and there is no appeal from its decisions. The two annual reports which it has publisht show that it has most admirably and effectively accomplished the purposes for which it exists.

The machinery for the settlement of disputes consists of two boards, known as the Board of Grievances and the Board of Arbitration. The Board of Grievances consists of ten members, five nominated by the manufacturers and five by the union. This board appoints two clerks or business agents who give their entire time to visiting the shops and settling disputes on the spot. They correspond to the diplomats in international law. When they fail the dispute is carried to the Board of Grievances where, ninety-nine times out of a hundred, it is amicably settled. But if the Board of Grievances fails to adjust matters there may be an appeal to the Board of Arbitration, consisting of Louis D. Brandeis, the well-known Boston lawyer, Morris Hillquit, perhaps the ablest Socialist in the United States and Hamilton Holt, of THE INDEPENDENT. A decision of the Board of Arbitration is final and both parties are bound to abide by it.

Thus it is obvious that the protocol is an admirably worked out plan for conducting industry without strikes and lockouts. Indeed, hardly had it been put in operation when the Ladies' Tailors and their employees adopted it, and ever since in both the Cloak and the Tailoring Trade all disputes that have arisen have been settled with scarcely a hitch. For a full account of the working of the protocol we refer our readers to the special investigation made by an agent of the Review of Labor and publisht in Bulletin 98 of the Bureau and also to the interesting article by Miss Gertrude Barnum in THE INDEPENDENT of Oct. 3, 1912.

When the present strike occurred the 35,000 workers in the Dress and Waist Trade also went out, but as already stated they have just settled their differences by a protocol of their own. This protocol, however, not only embodies all that was in the old protocol but it has added new features which make it, as far as we know, the most advanced and significant trade agreement in existence.

In addition to the minimum wage, preferential union shop and Boards of Sanitary Control, Grievances and Arbitration, it proposes to adopt a "white label" to be sewed on every garment as a guarantee that the garment was made under proper labor and sanitary conditions. It also proposes to establish a new board composed of both employers and employees and known as the Wage Scale Board, which will scientifically investigate the cost of labor and actually have the power to determine wages, subject to appeal to the Board of Grievances and Board of Arbitration. These, we believe, are about the two most significant proposals yet put forward in this country for the solution of the labor problem. They constitute nothing less than a recognition that the consumer on the one hand and the worker on the other have as real an interest in production as the manufacturer himself. Let us hope that the workers and employers in the White Goods, the Misses and Children and the Wrapper and Kimono branches of the trade, which are now fighting each other, will follow the example of their dress and waist sisters to the end that the entire women's wear trade may be operated under the beneficent banner of the peace protocol. Industrial peace, as international peace, can only be brought about by the substitution of law for war.

Any comment on these peace protocols would be incomplete without mentioning the names of Julius Henry Cohen and Myer London, the attorneys respectively of the manufacturers and the unions. Mr. Cohen first had the vision to see the solution of this problem and then the

diplomacy and devotion to bring both sides to adopt his plan. To him belongs the credit of establishing the great garment industry on a scientific, efficient and peacefully progressive basis.

Dollar Diplomacy

There is not a little talk of late, by no means always intelligent, about "Dollar Diplomacy," and sometimes it is intimated that the next administration will reverse the dollar diplomacy of the present administration. But what is meant by dollar diplomacy?

So far as we know it must be judged by the policy of our Government in the later years with regard to financial matters. It has attempted to foster our foreign commerce. It has directed our Consuls and our Ministers and Ambassadors abroad to do what they can to this end. It publishes very interesting "Daily Consular Reports" which give accounts of trade opportunities abroad. They are useful to merchants, and have given considerable help to our limited foreign trade. Certainly this kind of dollar diplomacy is commendable.

More definitely, our Government has at the request of Santo Domingo taken charge of the settlement of its indebtedness, has scaled down the claims against that little bankrupt country, has collected the customs duties and is rapidly clearing off the debt. This has been a great advantage to Santo Domingo, and of no advantage to us beyond saving us from trouble over the Monroe Doctrine when some European nation should, as in the troubles with Venezuela, attempt to levy on the land or customs. What we have done there has been wholly to the credit of our country.

Our Government has also worked, with the approval of the world, for the open door to business in Manchuria, and also for the participation of American finance in any dealings with China. Is there anything discreditable in that? Indeed it ought to be to the credit of an administration that it has been engaged in peaceful dollar diplomacy rather than diplomacy of the shoulder-chip variety.

The Blacker Plague

For a generation past the attention of those who wish well to the race has been transferred from sickness to health, from disease and its cure to sanitation. Each disease has had its turn, and its method of prevention has been studied, typhoid fever, yellow fever, leprosy, the plague, and, latest, tuberculosis and cancer. We are not trying to cure them, but to prevent them, to stamp them out.

While these diseases have thus attracted the attention, not of physicians only, but of the public, that other disease, whose name we scarce venture to pronounce, a disease both moral and physical, which endangers the race more than any other, we have studiously refused to consider; of it and its causes we have been silent. But there is abundant evidence that this silence and neglect will not continue. If we can exterminate the mosquitoes that cause malaria and yellow fever, or the rats that originate the Eastern plague, we are finding that we must and can put an end to that social disease and that social vice which are both sin and crime, and which curse more lives of men and women than any other.

We discover the growing sentiment in this subject when we read the many letters that come to us, thanking us for the editorial of two weeks ago entitled, "Is it a Crime as Well as Sin?" The commissions in so many of our great cities to study the social evil illustrate the same fact. It appears again in the attention teachers are giving to the question, how they can properly and decently teach children the facts and duties of sex. And now we rejoice to see, under the direction and support of John D. Rockefeller, Jr., an organization founded to study the conditions of the social evil and the way to abolish

it. He, like the rest of us, would have shrunk from the task; but when the city commanded a grand jury to look into the evil, and Mr. Rockefeller begged to be excused from this jury duty, the judge refused, and made him foreman of the jury, and compelled him to give months of study to its loathsome conditions. That judge is to be thanked, and Mr. Rockefeller also, who accepted the unwelcome task, and who has found in it an opportunity for great service to his country and to the world.

Hereafter this new battle will be publicly fought, and the subject can no longer be prudishly ignored. The papers are already treating it less gingerly. The women's clubs have opened upon it, for it is particularly a subject that concerns women, as they are the chief sufferers, and endure the worst wrongs. Legislation attacks it in the white slave traffic; and a number of cities have boldly suppressed the evil resorts, and removed those who inhabited them. The United States Government has made an investigation of the white slave traffic, and we have the report that there are in this city 25,000 white slaves, who are held in bondage by 6100 men, apart from other women of the class who live in their own apartments.

Like no other disease, except that of drunkenness, this is both a moral and a physical evil. It involves a sin and crime as well as a physical disease. Soon after the discovery of America it swept over Europe like a tempest. They called it the *morbus Hispanicus,* the *lues Gallica,* and attached to it the names of other nations, for it was an evil age, and it affrighted everybody as did the London plague. Those were worse days than ours, but our days are yet very bad. Medical reports tells us of half the soldiers in armies as infected by it. It is seriously reducing population. Because they are infected by it men avoid marriage, and innocent women contract marriage and disease at the same time, never suspecting the cause. The time has come when fathers are learning that they must require medical certificates of health from their prospective sons-in-law before they allow their daughters to marry. Legislatures are framing laws requiring such certificates. The subject can no longer be ignored as too indelicate to be spoken or thought of. It is the sin of men, the suffering of women, the wrong of posterity.

How are the sin and the disease that follows to be overcome? They are not necessities of civilization. Men can be chaste as well as women. Temptation and easy opportunities can be removed. The laziest way is to say, The evil has always existed; it is human nature; it always will exist, and we will control it as far as we can, shut it up in limited quarters and make it as safe as possible. That is quite too easy. The moralist and the sanitarian protest against it. There should be no compromise; it is war to the end against the pest and its commercialized support. Then we shall have more marriageable men, more marriages and a healthier and more numerous generation to follow.

Sabotage Illustrated

We take from the *Industrial Worker,* of Spokane, Wash., an organ of the I. W. W. and particularly interested in lumbering, the following suggestion warning against sabotage under the title "Don't Do it, Boys," which it is not difficult to read thru the lines:

We are sure that no self-respecting lumber worker would ever resort to that terrible thing called sabotage. We wish to warn all workers against it.

You don't know what sabotage is, you say? Well, perhaps it is best to tell you so that you may take warning.

Sabotage in the woods might mean working slow on the job. You wouldn't do that, would you? Never. It is against the interest of Weyerhauser, Clark, Kirby and Long. You love these gentlemen, don't you?

Sabotage may mean displacing the tools where they are not easily found. Promise us that you will never do that. The day workers especially should never resort to such an infamous thing.

Sabotage may mean that logs are cut

shorter than the required size. When the boss shortens your pay you should never shorten the lumber, for his daughter may desire to purchase a diseased count from across the ocean and you know your interests are identical. What a pleasure it is to be allowed to support a count.

Sabotage may mean the driving of spikes into the logs or even into the trees. Some uncivilized loggers have threatened to drive one 20-penny spike a day for every nickel that is cut from their wages. Terrible! No good, honest, christian, gentlemanly logger would do anything like that. It isn't good for mill saws.

Don't use sabotage, and for your kind forbearance we feel sure that you will receive a suitable reward. The boss may be generous enough to cut your wages so as to save you the trouble of spending so much, and lengthen your hours so that the devil may find no mischief for idle hands to do.

For the love of your boss and the glory of your soul don't use sabotage.

It would seem fair to raise the question whether such incitements to crime can legally be printed and sent thru the mails. The disguise is too thin.

The Snobbery of Sport

Lo the poor Indian has been exposed and all his trophies shipt back to Sweden to be awarded to the next highest bidder. The laurels that we won by proxy and have proudly worn for some six months are snatched from our brow and America, we are told, stands before the world disgraced.

And the cause of this sudden reversal of our fortunes? Has some error been discovered in the score, some mistake in measuring time or distance? Has it been discovered that Thorpe cheated at the games or fouled his competitors? Was the King of Sweden wrong when he hailed him as the greatest all-round athlete of the world? No, nothing of the kind. The conduct of the Carlisle Indian at Stockholm was irreproachable and he deserved all the honors he received, but it appears that he played ball one vacation and took money for it. Therein lies his crime. To be sure his share in the steamer *Finland* chartered to convey the America team to the Fifth Olympic must have been paid by somebody else and the trophies he won if melted down into bullion would amount to more than he ever got for playing baseball, but all that, not being filthy lucre, does not impair his amateur status. That Thorpe is a poor boy is no excuse. Poor boys are not supposed to take part in sport, that is to be reserved for gentlemen of leisure such as all college students are supposed to be and many of them are.

Such is the accepted etiquet of sport, as artificial and pedantic as the code of duello or the gaming table. To shoot a man from behind, no matter how much he deserves to die, is an ungentlemanly act. To decline to shoot him when he has stept on your toe or slapt your cheek is an ungentlemanly act. To cheat your tailor out of his honest dues by giving the money to one who has beaten you at cards is proper conduct in a gentleman.

A London doctor will scorn to make a charge for his services, but will pick up and pocket any gold piece that he finds lying on the mantelpiece. Yet the physicians of Great Britain have haggled with Lloyd-George over their wages under the insurance bill with as sharp an eye to their own interests and with as much disregard for the interests of the public as ever soulless corporation or militant trades-union. The remittance man provided with a ranch in West thru the generosity of relatives in England will denounce the pot-hunter in unmeasured terms and will never kill a deer except for pure sport. His next door neighbor a few miles off, being merely an American without aristocratic instincts, thinks it wrong to kill a deer unless he is out of meat. The college students who played the part of strike-breakers in New York hotels when the waiters went out, took the tips gladly, but refused to receive wages for their work. On the other hand, many a poor waiter out of employment would have declined to take the place of a striker

at any pay. A Chinese student is welcomed to this country if he has borrowed or stolen money enough to carry him thru his course, but let him beware how he attempts to earn his own living and pay his way thru college by any menial employment for then he becomes a common laborer and is liable to be deported.

Such are some of the curiosities of conduct that arise from the application of the monetary standard of propriety. The principle underlying it all is easy to see. Essentially it is based upon the idea that it is all right to take money if you don't need it, but wrong if you do.

We do not deny that it may be necessary to draw a line in athletics between the amateur and the professional. Herbert Spencer, who had a genius for definitions, stated the distinction most clearly when he said to one who had beaten him at billiards: "Young man, a moderate proficiency at billiards is the sign of a well-rounded education, but such proficiency as you have shown is the sign of an ill-spent youth." Judged by this standard many a college student who has an unimpeachable amateur status should be classed as a professional, for sport is his chief interest in life and he attends classes merely to gain admittance to the athletic field. On the other hand, many another student plays summer baseball purely for the purpose of earning money to put himself thru college and he is the truer amateur of the two.

The Balkan Decision

Last week we had to regret the Turkish indecision. At last the Turkish Cabinet was ready to yield to the demands of the allies and give up Adrianople, but it was too late. The Turkish Cabinet was overthrown by an armed force, just as in the evil days of Rome the emperors Pertinax, Julian and Septimius Severus were deposed by the army. Now it is the Young Turks who play the old part of the Pretorian Guards.

The beginning of this week finds both Turks and allies on the brink of the precipice of war. The new Turkish Cabinet consents, not to the cession of Adrianople, but of all the city except that portion which holds the ancient mosque and the sepulchers of the sultans. It may be too late. The allies are hot and headstrong, and are ready to sacrifice a hundred thousand more men to take Adrianople and, we suspect, then to rush down on Constantinople itself and bid the Turk scuttle across the Bosphorus now and forever. Is it worth the cost? Is it right, having gained what they sought, having freed Macedonia, thus to enrage and humiliate the chief Caliph of the Moslem world and risk the massacres that may follow, and at such fearful cost of Bulgarian and Servian life?

The latest conditions of peace offered by Turkey seem reasonable. Already the losses of the allies have been fearful. We trust they will accept the new terms and return to their homes to recover slowly from the disasters of war. And we cannot but believe that as China took to heart the lesson of its defeat in the war with Japan, so Turkey may learn the necessity of complete regeneration of her political government. We are not of those who believe that racial differences are such that each generation is bound to follow the ways of that which went before. The term *Turk* has a religious, not a racial, significance. Turks and Armenians are substantially the same stock. The Turks of Asia Minor, and equally of Macedonia, were predominantly Christians, converted by force. They had once a splendid civilization and may have again. If Japan could change, if China can change, so can Turkey. It is not necessary that the Turkish Empire should be utterly wiped out, which is not impossible—European Turkey certain to be given to the Christian allies, and Asia Minor and Syria and Mesopotamia seized by France and Russia and Germany, as is not impossible; but the patience of faith may allow a more peaceful, and perhaps a better, outcome of this terrible and yet glorious war. Our

blessings go to the Bulgarians, but we do not withhold our pity and sympathy from Turkey.

Democrats and the Offices

The Democratic party, in the Senate and in the House, is making a deplorable exhibition of partisan hunger and greed. In September, 1910, by executive order, President Taft placed in the classified service and under the protection of the merit rules the assistant postmasters and clerks in post offices of the first and second classes. In October, 1912, by another executive order, he brought into the classified service about 36,000 postmasters of the fourth class. For many years he had been known as an earnest advocate of civil service reform. These acts were in accord with his official recommendations. In his message to Congress he had repeatedly asked even for legislation that would add to the classified service the postmasters of great cities, the customs collectors of our ports and the collectors of internal revenue.

In its latest national platform, adopted when Governor Wilson was nominated at Baltimore, the Democratic party says:

> The law pertaining to the civil service should be honestly and rigidly enforced, to the end that merit and ability should be the standard of appointment and promotion, rather than service rendered to a political party.

In the House, on January 13, action was taken upon an amendment to the Post Office Appropriation Bill. This amendment, if it had become a law, would have annulled Mr. Taft's two executive orders of which we have just spoken, and it was attached to the bill by Democrats who desired that the offices affected, about 40,000 in all, should be counters in the game of politics; that a Democratic President should be free to appoint Democrats in the places of the present officers, possibly without regard for the merit of those who are now doing the work. In Committee of the Whole this amendment was adopted, without a roll-call, by a vote of 49 to 18. But when the roll was called, in the House, for final action, the amendment was rejected, 107 to 141. For it 106 Democrats voted, with 1 Republican. Against it there were 101 Republicans and only 40 Democrats. That is to say, the Democratic party, as represented in the House by this vote, stood for annulment of the orders by a majority of 2½ to 1. This is a record of which Democrats ought to be ashamed.

During the last three months Mr. Taft, as at other times, has been sending nominations to the Senate. He has continued to fill vacancies by appointment and promotions. Action upon these nominations, or upon all except three or four, has been prevented by the Democratic Senators, and now more than 1,000 are in suspense. Action has been prevented, without regard for the merit of the nominees or the quality of their service, simply in order that the vacancies may remain unfilled until the beginning of President Wilson's term. It appears to be assumed that the Taft nominations will be ignored by him and that he will substitute for the nominees men selected for him by the Democrats who have prevented action in the Senate and by those who voted in the House to kill the two civil service executive orders. In executive sessions the Democratic Senators have enforced their policy of obstruction by breaking a quorum and by making long speeches on all sorts of irrelevant topics. Their aim has been to save these offices or vacancies for the Democratic President at any cost.

It seems to us that they err in their estimate of Governor Wilson. We do not expect to see him revoking Mr. Taft's two executive orders and thus subjecting the 40,000 postal offices to political contest and intrigue. If they have forgotten, or if they desire to ignore, the national platform, we are sure that he has it in mind. But if that platform did not say that "merit and ability should be the standard of

appointment and promotion, rather than service rendered to a political party," he would still, we think, be faithful to the principles of what is known as civil service reform. This must be assumed by those who are familiar with his writings, his public utterances, and his environment and associations in past years.

A few days ago there came to this Governor of New Jersey a group of men representing labor unions. They asked him to appoint John T. Cosgrove, a Democrat and a labor leader, to be State Commissioner of Labor to succeed Lewis T. Bryant, a Republican, whose term is about to expire. The Governor declined to do this, for the reason that Colonel Bryant had been faithful and efficient. When he was urged to recognize labor in this instance, he said:

> There is another side in the matter which must be taken into consideration in justice and in consideration of public service. Public office is not worth anything, gentlemen, if an entirely satisfactory fulfilment of the duties of an office does not entitle a man to consideration for reappointment. If men are to know that a mere change of administration is to empty an office, no matter how they have deserved to be reappointed, there is not anything of justice or public right left. I feel to the full extent the argument you have made in favor of Mr. Cosgrove, but I haven't a clean slate to write on. If we were creating this office your arguments would be different. I am bound to consider the claim of a man who has devoted—I can myself testify—as much energy and ardor of spirit to this office as any public officer has shown. I entirely sympathize with the aspirations of labor and I entirely recognize the rights of labor, but as the responsible appointing officer I am bound to consider the name of a man who has made good as Col. Bryant has. Col. Bryant has made good and I am bound to consider his claims. I would be ashamed of myself if I did not.

Those who would have Mr. Taft's executive orders annulled or revoked, and those who are preventing action upon his nominations in the Senate, can find no encouragement in these remarks. If Governor Wilson insists upon reappointing in New Jersey a Republican whose service has been good, President Wilson will be equally just and not less faithful to the principles of the merit system in his action with respect to officers and employees of the national Government. If petty filibustering prevents voting upon Mr. Taft's nominations thruout the present session of Congress, we shall not be surprised if the new President sends some of them again to the Senate.

How Lincoln Would Have Laughed

He who looked with a genial eye on all the follies and ineptitudes of men, how he would have enjoyed the joke on himself which Congress has perpetrated. Mr. Bacon's Doric temple in Potomac Park will doubtless be correct archeologically and as beautiful as anything so dead, useless and alien can be, but why call it by the absurd name of "the Lincoln Memorial"? What is there about such a monument to remind one of Lincoln even tho it enshrines a gigantic statue of him in gilded bronze in place of the chryselephantine statue of Pallas Athene one would naturally expect to find there? Why should the Great Liberator be commemorated by an edifice characteristic of a people whose wisest men upheld the institution of slavery as natural, indispensable and eternal? If Lincoln had been trained for five years in Greek ideals as college students still are very likely he would not have ventured to assail an institution so ancient and respectable. Fortunately he never passed under the yoke of compulsory Greek. Why then should we impose it upon him now that he is dead?

If our architects insist upon looking to the past for a suitable style, surely Lincoln was more Gothic than Greek; a character complex, and unconventional, stoutly buttressed and lofty, with a gargoyl humor peeping out at unexpected places. But how can any of the traditional orders represent so original a genius? The first

American, as he has been called, standing for that new type of manhood which the union of the streams of Puritan and Cavalier may produce upon this new continent, surely he is deserving of a form of architecture more American than that of the Parthenon and more modern than 2300 years ago.

When we touched upon this subject before (see "Lincoln as a Greek God" in THE INDEPENDENT, Feb. 8, 1912) some of our readers wrote to us: "What would you have? A log cabin?" Nothing better illustrates the hopeless attitude of mind now prevailing, the confusion of "architecture" with "archeology" because they begin with the same syllable. They say: "You tell us not to imitate the Greek. What, then, shall we imitate?" when the whole force of our argument was intended to prove that architecture was not necessarily one of the mimetic arts like acting and photography. With the new structural materials and the new modes of decoration now available the architect of the present day has an unprecedented opportunity for the display of creative genius. It almost is as tho an aboriginal artist who had been using charcoal and ocher for the pictures on his cave walls should suddenly be given the palette of modern painters. But no doubt being a troglodite he would throw away the new colors and go back to black and red.

Lincoln's forbears who built the log house were better architects than those who are now in control at Washington. They took the materials at hand and with no tools but ax and saw fashioned them into comely human habitations, suited to the time and place. But altho Lincoln was born in a log house he did not stay there; so our indigenous American architecture, altho it has no reason to be ashamed of its humble origin, should not remain in the log house stage any more than it should borrow European models, adapted to other modes of life and thought.

What do they think of this in Lincoln's own country? Read this resolution:

Whereas: Such a memorial has no connection historically, nor from the standpoint of democracy with the work of Abraham Lincoln, nor with his life, his country or his time; but suggests rather the age of Pericles of ancient Greek history. Therefore, be it here resolved by the Chapter of the American Institute of Architects from the State which gave to the nation Lincoln, that the Illinois Chapter of the American Institute of Architects emphatically protests against the adoption of such a memorial;

First: On the high ground of patriotism as expressed in the Declaration of Independence and Lincoln's Gettysburg speech, the essence of which is trust in the intelligence and high aspiration of the American people, which this design most strikingly fails to embody:

Second: Because it would not in any respect typify or represent to this nation or the nations of the world the underlying character and Americanism of Abraham Lincoln, but would declare the architectural poverty and sterility of America in assuming the necessity of our imitation of the classic style, and would also represent Lincoln as an Athenian type instead of being what he was, a true American.

Third: That it does not associate him with his great work as President of the United States during its stupendous struggle for unity and existence and therefore is not of historic significance.

But, of course, no attention was paid by Eastern architects to a protest from such a source. What do they know about art out in Illinois?

To be sure they raised Lincoln; they educated him, recognized his greatness, gave him his opportunity, and finally forced him upon a reluctant and contemptuous East, but they can't be expected, lacking as perhaps some of them do a Beaux Arts training, to know what manner of man he was and how he may be best commemorated.

So the President has signed the Bacon bill with his eagle quill and $2,000,000 of your money is to be spent in erecting a marble monument that will represent to posterity all too faithfully the architectural ideals of America in the twentieth century.

The Pest of War

In one of the peace circulars issued by the World Peace Foundation President David Starr Jordan makes this remark: "It is said that for one hundred and fifty years after the death of Jesus His followers refused to fight in any battle or in any army." This passage as it stands is misleading. There were many Christian soldiers in the second and third centuries as well as later. But there were also Christians who thought military service wrong. Tertullian denounced it because it involved idolatry, a consideration that led him to denounce the theater and games as well; also because Christ had said: "He that uses the sword shall perish by the sword," and because Christianity stands for love, not hate, and hence for peace. His contemporary, Clement of Alexandria, and a century later Lactantius, also opposed war, partly on Christian, partly on philanthropic grounds. Even after the time of Constantine objections were occasionally raised by Christian teachers; but the Church generally accepted the principle stated by St. Augustine that Christians may properly engage in just but not in unjust wars, of course a distinction admitting all sorts of interpretation.

Absolution and Penance

The concluding fifteenth volume of *The Catholic Encyclopedia* has now appeared, and the editor, Dr. Pallen, has taken it to Rome to present it to the Pope. The *Encyclopedia* has great excellences and great defects. In its learning it often appears quite equal to the best, and in other articles the careful omission of facts is as noticeable. The difficulties under which the editor labored may be illustrated by the contradictions between the articles on "Absolution" and "Penance."

The article "Absolution" appeared in the first volume, and was assigned to a most competent scholar, Dr. Edward J. Hanna, of the Seminary at Rochester, N. Y. In it he based the authority of the Church over Absolution and Penance on the words of our Lord, "Whose sins ye forgive they shall be forgiven, and whose sins ye shall retain they shall be retained." But he goes on to say that the Church only gradually came to apprehend the power here given it, assuming at first that the forgiveness of sins took place at baptism, and that those who fell into sin could not be recovered and forgiven. Those less rigorous, like the author of the *Pastor of Hermas,* allowed one further forgiveness after baptism, and it was not till the third century that the Church came into full consciousness of its power in the time of Calixtus. The article on Absolution tells the reader that a full realization of the grant to forgive sins was not in the consciousness of the Church from the beginning. The Christian ideal forbade even the thought of return to sin. It was loth even once to grant a restoration to grace thru the ministry of reconciliation vested in the Church; but by the opening of the fourth century the fuller power of absolution was admitted.

No doubt Dr. Hanna's history was correct, but it was not pleasing at Rome. It was severely attacked by one of her own fellow-professors, and the result was that his name was withdrawn after he had been chosen to be auxiliary bishop of San Francisco. That first volume was printed in 1907. Now it was in 1907 that the Papal condemnation of Modernism appeared, and Dr. Hanna's article was Modernistic in that it admitted that the Church was not *semper idem.* As a result it was at first thought necessary to withdraw the whole edition of Vol. I, but we believe that instead a new page was substituted.

But further retraction was needed, and Dr. Hanna, as an obedient Catholic, consented to write the article on "Penance," in which he gave a new history of the doctrine in agreement with Papal requirements. It quotes the words of Pius X in 1907 condemning the error that "in the primitive Church there was no concept of the reconcilation of the Christian sinner

by the authority of the Church, but the Church by degrees only grew accustomed to this concept." This is just what Dr. Hanna had taught in "Absolution." Now, in "Penance," he yields and declares that "it is the Catholic doctrine that the Church in the earliest times believed in the power to forgive sins as granted by Christ to the Apostles"; and he proceeds to prove it at length. This *volte face* was made necessary by the encyclical on "Modernism," which was binding on the conscience of a loyal Catholic, such as Dr. Hanna was. He retrieved himself, and was again chosen as auxiliary bishop of San Francisco, and has been consecrated as such.

We have thought it worth while to tell this story as illustrating the difficulties under which a publisher or a scholar lies who may find himself obliged to change his belief on order. The one sympathetic view to be taken of the case is that which emphasizes "the will to believe," and which sees in the writer of the two articles a loyal clergyman who has honestly changed his opinions expressed in "Absolution," and made them conform in the article on "Penance" to the views declared orthodox by the Head of the Church. He thus follows the rule of thinking with the Church found in the "Spiritual Exercises" of Ignatius Loyola, to the effect that if the Church declares a thing to be black which appears to me to be white, then I must believe that thing black.

In Brief

It is a familiar saying about women, that we cannot get along with them or without them. But that is not true of the militant suffragets of England.

The discovery by Sir Joseph Thomson of a new gas is by no means so important as was the discovery of argon and helium in the air. It is simply another form of hydrogen, as ozone is an allotropic form of oxygen. It is not likely to be of any economical service.

By a vote of 70 to 46 the South Carolina legislature has petitioned Congress for the repeal of the Fifteenth Amendment giving negroes the right to vote. It says:

> In return for all these advantages he (the negro) has given the people of the United States only anxiety, strife, bloodshed, and the hookworm.

And yet it is a crime punishable with fine or imprisonment to entice negro laborers to leave the State. We should think emigration would be encouraged. Forty-six members had sense to see it.

It shows how far German constitutionalism is behind the British, that the Reichstag has this last week for the first time in its history past a vote of want of confidence in the Government. It was a rebuke of the Chancellor for his speech defending the right of Prussia to crowd the Poles out of Poland.

It is not a very Holy Synod of the Russian Church which wanted laws to prevent Jews from giving ordinary names to their children instead of Old Testament names. Does it not know that his parents gave Saul of Tarsus a biblical name, but he later changed it for the non-Jewish, Roman name of St. Paul?

Very nearly every voter voted at the Londonderry election, even the sick, and one man died when taken from his bed. The story is told of a previous election when the Unionist agent wrote to the candidate as follows:

> I am sorry to inform you that three of your supporters have died, but I am thankful to say that six Papists have also departed this life.

Now that a company of friends of the University of Pennsylvania have given $600,000 for the enlargement of its Museum, we may be sure that larger generosity will fill it. Such a museum cultivates research, and the enlargement of human knowledge; and that of the University of Pennsylvania already has many volumes to its credit.

Senator O'Gorman regards a political platform as being as binding as a Papal decree. He said in his late speech:

> Democrats who favor a repeal of the toll-free provision must wait for the solemn declaration of another Democratic convention. The last convention adopted unanimously a declaration in favor of free passage. That is Democratic doctrine now, and I think it will stand for the next four years.

No Modernism there.

The Irish Home Rule bill has, of course, been defeated in the House of Lords. At a

later time the House of Commons of the present Parliament can re-enact it, which will overrule the veto of the Lords, and it will become law. Just as it is rejected by the Lords Londonderry, in Ulster, at a by-election chooses a Nationalist to take the seat hitherto held by a Unionist.

Amendments to the Constitution are coming easy. The eighteenth is on the way, as the Senate has approved an amendment making the President's term six years, without re-election. Mr. Roosevelt's effort for a third term is responsible for it; and it will be interesting to see what position the Progressive party will take on it; also Mr. Wilson's friends.

The United States has taken of late a certain benevolent interest in Liberia, and some advice might well be given as to the approval by the Liberian legislature of an agreement concluded between the representative of its government and the Messrs. Lever Brothers by which, if ratified, they will take the lease for ninety-nine years of 12,000 square miles with full right to exploit it. Liberia needs a conservation party.

This week it is expected another State will approve the Sixteenth Amendment to the U. S. Constitution, which will give all that are needed to allow Congress, when desirable, to impose an income tax. It proves not to be so very hard to amend the Constitution; and the States are rapidly approving the Seventeenth Amendment for the popular election of Senators; and it is no harder to amend State constitutions. We do not need any easier way.

The will of the aged Englishman, Robert Arthington, gives $2,500,000 to the Baptist Missionary Society and $2,000,000 to the London Missionary Society. Mr. Arthington is well remembered in this country, for here he made large gifts to missionery societies many years ago. He was one of those who believed that Christ would return to reign on earth when the Gospel had been preached to every nation or tribe, and his money was given for new missions, and such is the provision in his last will.

In an address before some law-students Mr. Berger, the lone Socialist Congressman, had this to say to some who had interrupted him to assert that wage-earners are slaves:

> I want to say right now that all this talk about the workingman being worse off now than formerly is "bosh." The free wage worker is better off today than he has been at any other moment in the life of our industries. But because he is better off the workingman realizes that he has weapons in his hand with which he can cut his way still further.

That is absolute truth, and "bosh" is not too strong a word.

A Harvard teacher of philosophy, Professor Schermerhorn, is credited in the press with having said in an address the other day:

> Life is not confined to the animal and plant world, he said. The whole universe is alive, and all that lives is conscious. Animals are conscious and gifted with the power of thought and imagination. Plants are conscious, and Ruskin and Goethe agree they are capable of exercising strategy and forethought. Even Darwin said plants were sensitive, and hence he must have believed they were conscious.

That is the kind of nonsense that some philosophers are talking nowadays, and which sounds preternaturally wise. There is absolutely no particle of evidence that all nature is alive or has consciousness; and when Goethe and Ruskin talk of plants as conscious they are talking as poets, not as scientists.

Not yet do we have news of the conclusion of the trial of the Korean prisoners charged with conspiracy to murder the Governor-General. They were convicted in a district court, and the trial in a higher court of Korea has dragged along and the result is expected at any time. Meanwhile Chief Justice Watanobe, of the Supreme Court of Korea, has been on a trip about the world, and while here has written an article for the *Oriental Review*, of this city, in which he speaks of it as almost incredible that the prisoners should have been subjected to torture, as they assert. He is himself a member of a Presbyterian Church in Tokio, and the case may yet come before him.

It would require a population of angels to make the fee system safe from injustice in criminal proceedings. Governor Colquitt has been looking into the matter in Texas, and the *Houston Chronicle* thus reports him:

> It is impossible to secure an efficient and sensible administration of justice where the fee system offers a reward for the conviction of persons charged with crime. It has happened that innocent persons have been convicted because a string of fees stretches from the moment of arrest until the defendant is punished.
>
> Negroes have returned from the cotton fields with their hard-earned money only to be charged with crime and subjected to the fee-system drag. There are communities in Texas where a Negro imperils his liberty if it gets out that he has as much as $50 or $100.

So it seems that the hook-worm is not all that they have got out of the negro.

The Panama Canal a Sacred Trust

By Elihu Root

[Believing that the present is a critical period in American history when both our maritime interests and our international honor are at stake, we have devoted a great deal of attention to the question of Panama tolls, the various phases of which have been discussed in the following articles: "Why Should We Fortify the Panama Canal?" Frank W. Mondell, July 4, 1912, p. 17; "Panama Traffic and Tolls," E. R. Johnson, Aug. 15, 1912, p. 356; "Panama Tolls," July 25, 1912, p. 212; "A Surreptitious Subsidy," Aug. 15, 1912, p. 394; "The Panama Disgrace," Sept. 5, 1912, p. 571; "The Opening of Panama," Nov. 21, 1912, p. 1206; "Senator Root's Solemn Appeal," Nov. 28, 1912, p. 1262; "What Will Panama Mean?" Dec. 19, 1912, p. 1437; "Our Canal Treaties and Tolls," Herbert W. Bowen, Jan. 2, 1913, p. 28; "Christmas at Panama, J. A. B. Scherer, Jan. 16, 1913, p. 129. In the Senate and in public the necessity of maintaining our treaty obligations with Great Britain has been ably urged by Mr. Root, former Secretary of State, and the following article is a résumé of the argument which he has presented in recent addresses.—EDITOR.]

More than sixty years ago, when the United States turned its serious attention toward joining the two oceans by a canal thru the Isthmus, it found Great Britain in possession of the eastern end of the route which men generally believed would be the most available for a canal. Accordingly the United States sought a treaty with Great Britain by which Great Britain should renounce the advantage which she had and admit the United States to equal participation with her in the control and the protection of a canal across the Isthmus. The result of the effort was the Clayton-Bulwer treaty.

By that treaty Great Britain agreed with the United States that neither government should "ever obtain or maintain for itself an exclusive control over the ship canal;" that neither would do anything

> for the purpose of holding or acquiring, directly or indirectly, for the citizens or subjects of one, any rights or advantages in regard to commerce or navigation thru the said canal which shall not be offered on the same terms to the citizens and subjects of the other.

Under the provisions of this treaty the United States gave up nothing that it then had. It assumed obligations looking entirely to the future; while Great Britain gave up its rights to what was supposed to be the eastern terminus of the canal. Under this treaty Great Britain surrendered her rights to the Mosquito coast, so that the position of the United States and of Great Britain became one of absolute equality:

> for the purpose of more effectually carrying out the great design of this convention, namely, that of constructing and maintaining the said canal as a ship communication between the two oceans for the benefit of mankind, on equal terms to all.

That declaration is the cornerstone of the rights of the United States upon the Isthmus. The understanding is clearly stated in Article viii. of that treaty, as follows:

> The Governments of the United States and Great Britain having not only desired, in entering into this convention, to accomplish a particular object, but also to establish a general principle, they hereby agree to extend their protection, by treaty stipulations, to any other practicable communications, whether by canal or railway, across the isthmus which connects North and South America, and especially to the interoceanic communications, should the same prove to be practicable, whether by canal or railway, which are now proposed to be established by the way of Tehuantepec or Panama. In granting, however, their joint protection to any such canals or railways as are by this article specified, it is always understood by the United States and Great Britain that the parties constructing or owning the same shall impose no other charges or conditions of traffic thereupon than the aforesaid Governments shall approve of as just and equitable; and that the same canals or railways, being open to the citizens and subjects of the United States and Great Britain on equal terms, shall also be open on like terms to the citizens and subjects of every other State which is willing to grant thereto such protection as the United States and Great Britain engage to afford.

This is an explicit agreement for equality of treatment to the citizens of the United States and the citizens of Great Britain in any canal, whereever it may be constructed, across the Isthmus.

We are not without an authorative construction of our own as to the scope and requirements of such an agreement, for in the treaty of Washington, of 1871, there were provisions for the use of the American canals along the waterway of the Great Lakes and the Canadian canals along the same line of communication, upon equal terms to the citizens of the two countries. Some years later Canada undertook to do something quite similar to what we have undertaken to do about the Panama Canal. It provided that while the nominal toll of 20 cents a ton should be charged upon the merchandise of both countries, there should be a rebate of 18 cents on all merchandise which went to Montreal or beyond.

Upon the protests of the United States, Canada retired from the question which she had taken rescinded the provision for differential tolls, and put the American trade going to American markets on the same basis of tolls as Canadian trade going to Canadian markets. She did not base her action upon any idea that there was no competition between trade to American ports and trade to Canadian ports, but she recognized the law of equity in good faith and honor.

The Clayton-Bulwer treaty was sought by us, not by Great Britain. Great Britain had present rights which she must surrender. We had only future responsibilities to assume. In seeking the treaty we declared to Great Britain just what it was that we sought. Mr. Rives was instructed to say, and did say to Lord Palmerston, in urging him to make the Clayton-Bulwer treaty, that we

> sought no exclusive privilege or preferential right of any kind in regard to the proposed communication, and our sincere wish, if it should be found practical, was to see it dedicated to the common use of all nations on the most liberal terms and a footing of perfect equality for all. That the United States would not, if they could, obtain any exclusive right or privilege in a great highway which naturally belonged to all mankind.

Upon that representation Great Britain relinquished her coign of vantage which she herself had for the benefit of her great North American empire, for the control of the canal across the Isthmus.

Some years later we undertook to secure still further concessions from Great Britain, giving us the right, alone, to construct and maintain a canal, and the result of the application was the Hay-Pauncefote treaty. The preamble provides for preserving the provisions of Article viii. of the Clayton-Bulwer treaty, which I have quoted. It then provides for the construction of the canal by the United States alone, instead of under the auspices of both countries, subject to the general principle established in Article viii. of the Clayton-Bulwer treaty. It then provides rules for the conduct and use of the canal substantially the same as those for the free navigation of the Suez Canal.

We are not at liberty to put any construction upon the Hay-Pauncefote treaty which violates the controlling declaration of absolute equality between the citizens and subjects of Great Britain and of the United States. The question of discriminating in favor of our own coastwise shipping is not new. When the Hay-Pauncefote treaty was under consideration in the Senate this amendment was proposed:

> The United States reserves the right in the regulation and management of the canal to discriminate in respect of the charges of traffic in favor of vessels of its own citizens engaged in the coastwise trade.

The report to the Senate from the Committee on Foreign Relations, says:

> The United States cannot take an attitude of opposition to the principles of the great act of October 22, 1888, without dis-

crediting the official declarations of our Government for 50 years on the neutrality of an Isthmian canal and its equal use by all nations without discrimination.

To set up the selfish motive of gain by establishing a monopoly of a highway that must derive its income from the patronage of all maritime countries would be unworthy of the United States if we owned the country thru which the canal is to be built.

But the location of the canal belongs to other governments, from whom we must obtain any right to construct a canal on their territory, and it is not unreasonable, if the question was new and was not involved in a subsisting treaty with Great Britain, that she should question the right of even Nicaragua and Costa Rica to grant to our ships of commerce and of war extraordinary privileges of transit thru the canal.

In view of that report the Senate rejected the amendment offered be Senator Bard of California, providing for preference to the coastwise trade of the United States, declaring the rule of universal equality without any preference or discrimination in favor of the United States as being the meaning of the treaty.

It was upon such repeated declarations that Great Britain made the first concessions, entering into the Clayton-Bulwer treaty. It was upon the same declarations that Great Britain was induced to modify that treaty, giving up her right to joint control of the canal, putting in our hands the sole power. Mr. Blaine, Secretary of State, instructing Minister Lowell to propose to Great Britain the modification of the Clayton-Bulwer treaty, wrote:

Nor, in time of peace, does the United States seek to have any exclusive privileges accorded to American ships in respect to precedence or tolls thru an interoceanic canal, any more than it has sought like privileges for American goods in transit over the Panama railway.

Under these declarations and solemn assurances Great Britain abandoned her rights under the Clayton-Bulwer treaty, and we are not at liberty to give any other construction to the Hay-Pauncefote treaty than that which is consistent with these declarations and with Article viii. of the Clayton-Bulwer treaty, which was embodied in the Hay-Pauncefote treaty.

The suggestion is frequently made, of late, that we are relieved from the obligations of our treaties with Great Britain because the Canal Zone has become our own territory. It is said that we are entitled to build a canal on our own property and do what we please with it. But nothing can be further from the fact. It is *not* our property except in trust. Our treaty with Panama, by which we obtain our rights on the Isthmus, says:

"The Republic of Panama grants to the United States in perpetuity the use, occupation, and control of a zone of land and land under water for the construction, maintenance, operation, sanitation, and protection of said canal," and for absolutely no other purpose; while Article xviii. of the same treaty, provides:

The canal, when constructed ,and the entrances thereto shall be neutral in perpetuity, and shall be open upon the terms provided for by Section I, of Article iii, and in conformity with all the stipulations of the treaty entered into by the Governments of the United States and Great Britain on November 18, 1901.

So that far from being relieved of the obligations of the treaty with Great Britain by reason of the title we have obtained to the Canal Zone, we hold that title impressed with a solemn trust that we observe those obligations. We hold it for no purpose except to construct and maintain a canal in accordance with all the stipulations of our treaty with Great Britain. We cannot be false to those stipulations without adding to the breach of contract, a breach of the trust which we have assumed.

Another suggestion made regarding the obligations of this treaty, is that matters relating to the coasting trade are of special, domestic concern and that nobody else has a right to say anything about them. We did not think so when we were dealing with the Canadian canals; but that may not to be conclusive as to our rights

under this treaty. Let us examine it further.

We call a voyage from New York to San Francisco, passing along countries thousands of miles away from our own territory, "coasting trade." We call a voyage from New York to Manila, on the other side of the world, "coasting trade." It indicates rather a poverty of language than a genius for definition, because when we use the term "coasting trade" what we really mean is that under our navigation laws a voyage which begins and ends at an American port has certain privileges and immunities and rights. It is in that sense that the term is used in this statute.

Coasting trade is ordinarily neighborhood trade, by which the people of a country carry on their inter-communication by small vessels, poor vessels, vessels carrying cargoes usually of slight value. It would be impracticable to impose upon such vessels the same kind of burdens which great ocean steamers, carrying to the farthest parts of the earth, can well bear. We *should* make that distinction. England makes the distinction, altho Great Britain admits all the world to her coasting trade. It is quite a different basis of classification when we call a voyage from the eastern coast of the United States to the distant Orient a coasting voyage, because it begins and ends in an American port. But grant that we are entitled to fix a different rate of tolls for that class of trade; what then? Great Britain has her coasting trade thru the canal on the same basis, and Mexico has a coasting trade thru the canal, and Germany has a coasting trade, and Colombia a coasting trade thru the canal, by the same definition. We certainly are not at liberty to discriminate in fixing the tolls between a voyage from Portland, Maine, to Portland, Oregon, by an American ship, and a voyage from Halifax to Victoria, by a British ship, or from Vera Cruz to Acapulco, in a Mexican ship, because when we do that we discriminate, not between the coasting trade and the other trade, but between American ships and other ships under the same classification, which is a violation of the rule of equality which we have solemnly accepted and adopted, asserted and re-asserted, and to which we are bound by every consideration of honor and good faith.

It is idle to say that the question of imposing tolls or not imposing tolls upon our coastwise commerce is a matter of our own concern. We have made a treaty about it. It is a matter of our treaty rights and duties. They are mistaking the point who dwell upon our rights to fix the tolls or remit the tolls to our own commerce. The question is, after remitting tolls to American vessels, under a certain classification, have we the right to *charge* tolls to British vessels coming under the same classification? Nobody disputes our right to let our own ships go thru the canal without paying tolls. What is disputed is our right, in the light of the treaties and declarations we have made, to charge tolls against other ships when we do not charge them against our own. That is a pure and simple question of international right and duty and depends entirely upon the interpretation of the treaty. If we claim the right and act upon it, we must do so according to the treaty as we interpret it. If Great Britain protests against our right she must do so in accordance with her interpretation of the treaty.

Here comes in another treaty between the United States and Great Britain, made on the 4th of April, 1908, in which the two nations have agreed as follows:

> Differences which may arise of a legal nature or relating to the interpretation of treaties existing between the two contracting parties and which it may not have been possible to settle by diplomacy, shall be referred to the Permanent Court of Arbitration established at The Hague by the convention of the 29th of July, 1899, provided, nevertheless, that they do not affect the vital interests, the independence, or the honor of the two contracting States, and do not concern the interests of third parties.

The question of the rate of tolls on the Panama Canal does not affect any nation's vital interest, or the independence of honor of either of the contracting parties. It is purely a difference relating to the interpretation of a treaty. That is all there is to it. We are bound by our treaty of arbitration not to stand with arrogant assertion upon our own Government's opinion as to the interpretation. If we do we shall not only have violated our solemn obligations assumed in three treaties, concerning the conduct of the canal, but we shall be false to all the principles that we have asserted to the world and urged upon mankind. We have been the apostle of arbitration. Presidents, Secretaries of State, Ambassadors, Ministers, Congresses—all branches of our Government—have committed the United States to the principle of arbitration irrevocably, unequivocally, in season and out of season. What a revolting hypocrisy we convict ourselves of it, after all of this, the first time there comes up a question in which we have an interest, because we fear we may be beaten in an arbitration, we refuse to keep our agreement.

Are we ready to admit that our country, that its Congresses, and its Presidents, have all been guilty of false pretense, of humbug, of talking to the galleries, of fine words to secure applause? We must do just that if we arrogantly insist that we will determine our rights under the treaties and refuse to abide by the agreement of our treaty of arbitration. And what is it all about? What is it all for? Is the game worth the candle?

We refuse to help our foreign shipping which is in disastrous competition with the lower wages and lower standards of living of foreign countries, while we take this serious step for the benefit of our coastwise shipping which has now, by law, absolute protection of a statutory monopoly and which positively needs no help. Is it worth while, even under financial considerations? For if, on better thought, we stood by our treaty of arbitration, the question would not be whether we had the right to remit the tolls upon our own ships, but whether, under the treaty, we then had the right to charge tolls to the ships of other nations in the same class. The decision might come in two years, or ten years. If in the meantime we have been imposing tolls on British, German and French ships, and no tolls on American ships, what must the judgment be if it is against us? The only way to right the wrong will be to remit all the tolls we have collected, thruout the years, from the foreign ships; and a great part of the income from the canal—no one can tell how many millions of dollars—will have to be taken out of the Treasury of the United States and paid over to the foreign ship owners. Even those who believe that we are not violating our pledges in passing our own ships free can but admit that there is a dispute as to the interpretation of the treaty and that it is a matter distinctly subject to arbitration, and in view of the results if the judgment should be against us, even they can hardly feel that the game is worth the candle.

We all love our country. We all desire for it that power among the nations of the earth which will enable it to accomplish still greater things for civilization. How sad it would be if we were to dim the splendor of the past, the splendor of this great achievement by drawing across it the mark of petty selfishness, of false pretenses, of broken obligations. Let us rather put aside the idea of small, petty advantage; let us treat this question and these obligations in our relation to this canal in that large way which befits a great nation. Let us either submit to an impartial tribunal the question whether we are right; so that if we are right we may be vindicated in the eyes of all the world; or else by a repeal of the provision discriminating in favor of our own shipping, retire from the position which we have taken.

Washington, D. C.

THE ANTARCTIC REGION

Showing the routes of explorers of various nationalities, culminating in Captain Amundsen's discovery of the South Pole, Dec. 14, 1911. From Amundsen's "The South Pole" (see Keedick.)

The Desolate South Pole

By Captain Roald Amundsen

[Captain Roald Amundsen, the hardy Norseman, who on Dec. 16, 1911, reached the South Pole, has been in the hands of his American friends since Jan. 11, when he arrived on the steamer *St. Paul*. Previous to that time he was in the hands of his Norwegian friends. That he has survived is the best possible evidence that he is a worthy descendant of Vikings and fit to cope with any hardships. He is tall, lean, blonde, blue-eyed, with frank smile and, like other really great men, as simple and direct as a child. Lion-hunters terrorize him and some of his experiences here have been far harder to bear than anything found among the ice and snow. Down in the Wall Street district the other day it took two strong men to drag him to a position where he could be seen and cheered by some scores of fellow beings who were intent only on the rise and fall of stocks—but who graciously suspended their important occupation in order to give perfunctory greeting. Poor modest Amundsen's countenance expressed horror and despair as he was dextrously propelled to the front to be introduced as "The Great Explorer." This article is with his permission prepared from an interview.—EDITOR.]

There is no life at the South Pole, no kind of life, in air or water or on land. There is a great continent covered by ice and snow. Animal life, so far as was observed, does not extend beyond the Barrier, which is 700 miles distant from the Pole.

We found bare spaces on the land and collected geological specimens, but nothing to show that the South Pole region holds treasures which would interest our civilization. We found no evidence of gold, silver, copper or iron. I am not responsible for the statement that there are in that region some of the largest coal deposits ever discovered and I did not express a hope that they would soon be developed. Information on the subject of the coal comes, I believe, from Sir Ernest Shackleton.

But even if there are in the South Polar region very large deposits of coal and of precious metals they will simply be something to sigh over—they are inaccessible. Miners cannot live there and even if they could live and could work mines no one would be the better off as there would be no way to get their products out to a point where commerce could reach it. The lowest temperature we found at or around the South Pole was 75 degrees below zero, Fahrenheit. The highest velocity of wind was 20 meters per second. It is a region of storms.

No, I doubt that South Polar exploration will realize anything that can be directly made of material benefit. But, on the other hand, any addition to our present fund of scientific knowledge is of immense importance and our magnetic observations taken at or near the Pole are, therefore, most valuable. So, also, our geological specimens.

I like this country very much and feel that while here I am among friends. I have experienced and am experiencing great kindness which I keenly appreciate. Hospitality extended to me here is well-nigh unbounded and the engagements I must make certainly keep me busy, but the spirit shown by my American hosts is beautiful and makes it a privilege to meet them. I am not tired and have no intention of resting. I will remain in this country lecturing until next July, when I will away, this time to the North Polar Region, to work again.

I have already been to Norway since returning from the South Pole, and Norway has done everything possible for me in the way of giving honors, entertainments and receptions. And I am profoundly grateful to her.

As to New York, I have been here before, the last time in 1909, so I am no stranger here, yet the city almost looks strange at first sight. It has changed so much in three years. I find the tall buildings very impressive, also beautiful, in a bold sky-mounting way—highly expressive of the aspiring ideals of the young metropolis which has set itself the task of surpassing in all respects all others that are or ever were.

New York, Jan. 19, 1913.

On Wings of Steel

By O. Warren Smith

In Thoreau's *Journal,* under date of December 29, 1858, we find the following entry:

I think more of skates than of the horse or locomotive as annihilators of distance, for while I am getting along with the speed of the horse, I have at the same time the satisfaction of the horse and his rider, and far more adventure and variety than if I were riding. * * * The skater can afford to follow all the windings of the stream, and yet soon leaves far behind and out of sight the walker who cuts across. Distance is hardly an obstacle to him. * * * The skater has wings, *talaria,* to his feet. Moreover, you have such perfect control of your feet that you can take advantage of the narrowest and most winding and sloping bridge of ice in order to pass between the button-bushes and the open stream or under a bridge on a narrow shelf, where the walker cannot go at all. You can glide securely within an inch of destruction on this the most slippery of surfaces more securely than you could walk there, perhaps, on any other material. You can pursue swiftly the most intricate and winding path, even leaping obstacles which suddenly present themselves.

I ofttimes say that it was Thoreau who taught me to skate. Of course, I, like all northern boys, learned how to manage the steel runners long before I arrived at Thoreau, but it was the sage of Walden Pond who confirmed a lurking suspicion I discovered in my own mind, to wit: it is not all of skating to make your legs go. Not always does he skate best who skates fastest or with the crowd. We cannot conceive of Thoreau as a regular attendant upon the modern skating rinks, "artificial outdoors," he probably would have dubbed them. While an artificial pond in a city park will do well enough as an outdoor gymnasium, not to mention the

opportunity it offers for the display of natty skating costumes and innocent flirtation, it is not until one has stolen away all by himself upon the ice of some unfrequented river or lonesome lake that he can be said to have entered into the true spirit of the sport. Understand, I am not a recluse, out with society because of some real or fancied wrong. I know that the man or woman who does not enter into the life of his or her community in the largest possible way, aiding every enterprise for the uplift and purifying of society, is as guilty before Almighty God of a misdemeanor as the anarchist who lifts his poisoned knife against organized government. The latter is not more destructive of society than the former. Having said that for my own justification, let me add, that the one who would best serve society must withdraw himself from the crowd occasionally for the purpose of rest, recuperation and self-knowledge. He who long ago said "Know thyself," hinted at the right solution of every social problem. From the foregoing you will gather that when I don the "wings of steel" it is not simply that I may enjoy a couple of hours exercise, but that I also may get in touch with Nature and sound the depths of my own soul.

There is nothing quite equal to a river for a skating party of one, tho a small lake may be made to serve, a large lake is too vast and limitless in winter-time to be companionable; then too, it is along the shore that one must generally look for bird and animal life, without which skating would lose half its attractiveness. A river has the agreeable habit of eating up the snow which falls upon it every time there is any noticeable rise in temperature, so two or three times during the winter it affords skating. You can make a river eat up the snow whenever you have a mind to dam its flow, but when it does it itself without your aid, there is that naturalness in the process which gives a tang to the outdoors. I never fell in love with an artificial skating rink or a geometrical flower-bed, tho, of course, both have their legitimate places. A narrow rind of ice along the current, tho roughened by wind and wave, is more satisfactory than the smooth and glary surface made so by man's inventions. Seven hepaticas nodding in the breeze, sheltered from the cold winds of April, are more *real* than any regular flower-bed laid out by rule and tape in the hands of a landscape gardener.

One who has never followed a winding river, fettered but not silenced by the chains of Jack Frost, cannot imagine what a strange and wonderful world lies within reach. Even tho you may be acquainted with every bend, crook and turn of river-bank or sinuous lake beach before snow falls, after that miracle has taken place a brand-new world has been created, a *terra incognita*, the spying out of which is rare fun. I like to hear the water chuckling away beneath the ice, laughing over some joke of its own; perhaps thinking of the time when it will fling aside Jack's white manacles, and dash unfettered on to the sea. I wish I partook more largely of the nature of my river, could laugh alway beneath the stifling fetters of life's grind and worry. Perhaps if I too never forgot that my Spring must needs come in good time, I would be more optimistic.

I like to glide quietly and carefully up to the very edge of some bit of open water where the swift current never for a moment surrenders the battle it wages with the frost, for such an opening is a window thru which one can gaze into an unknown world. Sometimes a little school of minnows will be discovered disporting themselves, darting here and there to mouth every floating speck as possible food, all unminded of the chilling water. Once when standing by such an opening watching a family of shiner minnows they suddenly displayed great agitation and in a flash were gone. Puzzled, I remained in my tracks without moving so much as a finger, for I early learned that

he who would spy out Nature's secrets must have absolute control of his muscles. Then a long nose protruded from beneath the ice at the down-stream end of the hole and slowly, almost imperceptibly, advanced until the evil, rapacious head of a pike—"river pickerel"—was disclosed. Among fresh water fishes I think there is no more sinister face the pike was moving. The surprise of it caused me to start ever so slightly, and presto! there was a swirl in the water, pandemonium for a second and the freshwater shark had vanisht. The little minnows returned and took up their work or play where they had dropped it, and I continnued my journey down-stream upon the ice.

ON WINGS OF STEEL IN CENTRAL PARK, NEW YORK CITY

than that of the pike, and his character does not belie his countenance. Whether or not the fish saw me I was unable to determine, certain it is that he did not know what I was, tho I could see the glint of his yellow eye. How he could maintain his position in that strong current without effort was an enigma to me, yet the only sign of life I could discover was a rapid fanning of the pectorial fins. All at once, to my surprise, I discovered that the fish had moved up-stream until its whole body was disclosed, and I had not realized that

It was Thoreau's statement that "the skater can afford to follow all the windings of the stream," but it remains for us to say that he cannot afford *not to,* for so doing he will discover a strange, wild world waiting for exploration and exploitation. The skater who selects a smooth area of ice, shunning the wind-roughened surfaces, skates in a circle, is comparable to the man who in thought and life selects the smooth and easy, refusing to pioneer; such a man gets the exercise so to speak, but the joy of discovery and con-

structive thinking will never be his. The other day, following the marge of my river, I discovered a spring of which I had never heard. "What of that?" did you say? "What of that," indeed! My discovery differed from that of Vilhjalmar Stefansson only in kind. I found the track of a mink leading away from the spring, a fox too had paused to drink, while from back in the swamp came the nervous "quit, quit" of an anxious ruffed grouse. Can't you see that that spring is the Mecca of the wild creatures of that locality, and will increase in importance as the days lengthen and the cold strengthens? Suppose someone should set a trap there, and—but perish the thought! One mink at liberty is worth two in a trap. To observe a mink and not be observed by him is a treat indeed, for of the small beasts there is none more lissom and graceful; black as Erebus against the white background of the snow.

Eating played but a small part in the life of Thoreau, he would make an all-day excursion upon a handful of dried cake crumbs; but when spying out the shores of my river in winter time I plan to have a warm meal at the noon hour, and I am in no wise a gourmand. The exercise, the biting air, the spicy breath of the firs, all combine to flirt with a man's appetite and twelve o'clock finds him famished. A little fire in the lee of some rock-bound shore, a bubbling black pail giving off the piquant odor of coffee, and perhaps a generous slice of smoked ham sputtering on the end of a green stick while a slice of bread and butter blushes from the end of another; if that does not spell dinner, generous and satisfying, I do not know what does. Ordinarily I am not a lover of bread and butter, was not even as a child and then it was sprinkled with sugar, but in the woods I can eat all I carry and wish for more. Do not think that I eat all the crumbs. I leave a generous supply for those black-eyed Lazaruses of the winter woods, the chickadees.

Always in winter time these black-cowled beggars gather at the sign of a winter camp-fire, pert, voluble, friendly; and in that mellow interregnum which always follows a satisfying meal after outdoor exercise, their presence is very pleasing. It does one good to find the wild creatures displaying confidence in mankind, their confidence being in exact ratio to our trustworthiness. But of all the birds I know of, none that will more quickly respond to a little show of kindness than the winter chick-a-dees. To have one perch upon the very slice of bread from which you are eating and gobble away unconcernedly is not an uncommon experience. There are other birds too that rally to the sign of ascending smoke, tho we may not here mention them all. The nuthatch, careless of the perpendicular, head up or head down, it is all one to him, always conjures with my imagination; I sometimes wonder if he does not perform his acrobatic stunts in order to coax from me a large corner of bread, at any rate it is always forthcoming. Then there are the noisy, bullying blue jays and the woodpeckers that even Jack Frost can't freeze out. Oh yes, they are all to be found along the winter river in company with the winter visitants from the Arctic Circle, crossbill, grosbeaks, etc.

If you have never skated out of the beaten track, away from the crowd that jostle and push and laugh, into that mystic, strange country which lies within easy reach of the one who wears the wings of steel, the winter woodland, you have never truly skated. Use the wings of steel to fly away from din and noise, from people that fret and worry, into the creative silences, the self-contained winter woods. Do a little exploring on your own account, digging within your own ribs the while. Fear not the cold and bluster of a January day, face it and find health. Not outdoor air but super-heated houses are provocative of disease.

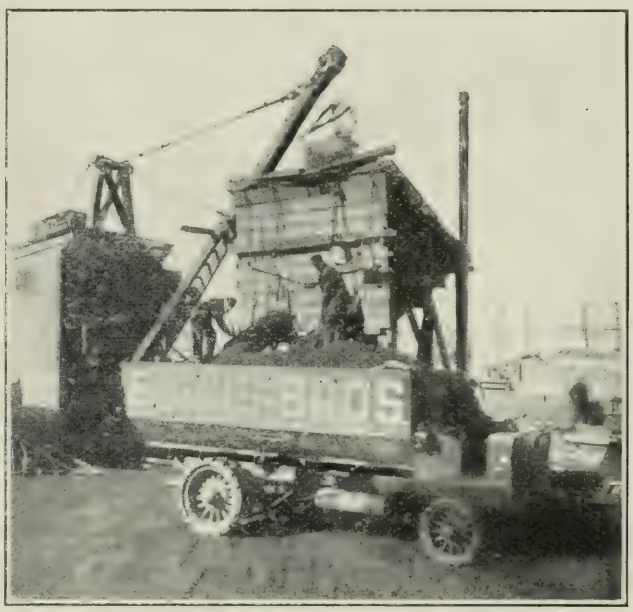
Durand, Wis.

The Passing of the Horse

Why the Cause of Civilization Demands a Horseless Age

By Rollin W. Hutchinson, Jr.

It has been the fashion of the automobile press agent since the days when the first queer looking contraptions called "horseless carriages" began to appear (about 1899), to speak in glowing terms of the Horseless Age that was to come. In superlatives and striking similes they painted a picture of poor old Dobbin looking upon his new born rival with an exclamation of such horror that it caused a sudden dissolution of his healthly existence. According to these wild dreamers, we would, by the year 1915, look upon an equine quadruped on the streets with as much amazement as some wild beast from the Paleolithic Age suddenly come to life again. Let us inquire whether the Horseless Age Prophets have forecasted rightly their beautiful vision of this Horseless Age. According to the Year Book of the Bureau of Plant and Animal Industry of the National Bureau of Agriculture, the number of horses in the United States in 1900 (about the time the first pleasure automobiles began to appear) was 15,506,000 horses and 2,753,000 mules. In 1911 this selfsame authority tells us there were 17,344,000 horses and 3,754,000 mules, an increase of 27 per cent in a trifle over ten years. Again we are told that in 1899 the average price per head of horses in the United States was 75 dollars. In 1911 the average valuation per head increased to 106 dollars. All of this time our Horseless Age Prophets have been telling us that we are on the threshold of an era when the horse would be relegated to the same position of some rare fauna of the museum.



We are compelled to ask ourselves the question "What has the horseless vehicle done to bring about the passing of the horse?" and the answer is, "Practically nothing, so far." The most potent influence which the pleasure automobile has exercised to drive the horse into oblivion has been to concentrate his field of service mainly to agricultural sections where the greatest efficiency from his services can be obtained. The statistics of the number of horses in use for drawing pleasure vehicles in 30 of our largest cities show in ten years a decrease of approximately 25 per cent. On the other hand, the percentage of horses devoted to purely commercial service has increased about 33 1-3 per cent in the same ten years. The mechanical wagon has, up to the present time, caused the displacement of only about 200,000 horses in the entire country, figuring that in the year 1912 approximately 50,000 motor vehicles are used for commercial service and estimating that each of these motor business wagons has displaced on an average of four horses. What an insignificant percentage these 200,000 horses bear to the total number of horses in the United States today!

No, we have not yet arrived to a Horseless Age, but we are approaching it surely and steadily, altho at this time it must be confessed that the exit of the horse is centered mainly in our principal large cities. For example, in a period from Feb. 1, 1911, to Feb. 1, 1912, the "wheel tax" registrations of Chicago show that the number of mechanical business wagons increased from 788 to 1439—all told, there were 50,000 horse-drawn wagons in Chicago on Feb. 1, 1912. At this rate of increase it will take but a trifle over five years to bring about an actual Horseless Age in Chicago. In New York City, which has the largest number of horses in business use, the number of motor trucks increased in the one

year period from 1911 to 1912 from 2500 to 4100. At this rate New York's highways of commerce should be completely motorized in the next eight years.

Champions of the motor business wagon have dilated at great length upon the economy and the efficiency of the motor over the horse, but few of these sponsors of the new art of transportation have considered that there are broader reasons than economy and efficiency of the motor which must bring about in actuality the Horseless Age. We are shown pictorially and graphically the poor horse lying prone upon the sleety pavement or prostrated by the July sun and yet we are not very deeply impressed by this appeal to our sympathies on behalf of the poor, abused horse! As a matter of fact, the business world does not decide questions of transportation on emotional grounds, but purely by an appeal to the reasoning faculties. Due to the fact that the horse has been with us long before the days of Pharoahs, the business world still thinks as a rule in "horse units" and horse traditions so surround its conception of highway delivery service that the custom of seeing horses put up an unequal struggle against weather and climatic conditions is so common that it is only an ordinary thing in the course of events. There are deeper reasons why the horse must go from urban service than the fact he is unfitted for service in the extremes of winter and summer. The history of transportation like the history of a race or nation shows a constant evolution. Man does not progress backward and the mechanical wagon has been developed because the human race has progressed to that point where it demands a different agency for propelling its highway vehicles. The mechanical wagon is the next link in the chain of Transportation Evolution just as the railroad was the next step in evolution from the stage coach. Changed economic conditions brought about during the last 25 years demand the utilization of the motor wagon just as the advance of civilization demanded the telephone, typewriter, elevator, skyscraper and other institutions in our daily life that have become too common now to be considered anything more than necessities.

When we scratch the surface and go beyond the great questions of the great economy and efficiency of mechanical vehicle delivery, we are alarmed over the enormous waste involved thru the perpetuation of an animal which is productive only in the sense of being utilized for its "draw bar pull." Even the sponsors of the horse are beginning to wake up and realize how great is the extravagance of retaining an obsolete method. Very recently one of the leading journals devoted to the interests of horse owners asked the following questions in an editorial:

COAL HAULED BY GASOLINE

The 10-ton motor truck hauls the greater portion of New York's coal supply. This view shows a "down-to-date" method adopted to keep them in constant motion and thereby obtain the earning possibilities of motor transportation. The coal is lifted by means of a derrick boom into the elevator, flued direct into the body of the truck, and by loading in this way the loading is done in about four minutes.

"What becomes of the $740,000,000 annual hay crop?"

"The horse eats it."

"What becomes of the $334,000,000 yearly oat crop?"

"The horse eats most of it."

"What becomes of the $2,000,000,000 average corn crop?"

"The horse eats a very large part of it."

The growth of population and the soaring cost of living certainly demand that the vast acreage required to produce these large cereal and forage crops be devoted to the needs of the human race. But the two billion dollars' worth of food which the horse consumes every year in the United States is but a small percentage of the economic loss which we suffer individually and collectively for continuing the inefficient horse system of highway transportation. His parasitical depredations are far-reaching. He requires an army of "nurses"—hostlers, stablemen, blacksmiths, veterinaries, the aggregate number of which, figuring one man per 30 horses team, totals 750,000 of our population dedicated to the task of keeping our equine population going on its four legs in a haphazard fashion! What an awful waste of human labor in this day when every branch of manufacturing and agriculture are putting up a hue and cry for "labor, more labor!" Just consider what these 750,000 million men could produce from their labor in productive channels—in agriculture for the growing of food crops consumed by the human population or the creation of manufactured products necessary to the promotion of the arts and for clothing the human race. The enslavery of a three-quarter million of men to make him fit for his very inefficient labor is but one of the many economic crimes chargeable to the equine parasite. Look at the thousands of tons of steel which are abraded upon the hoofs of these millions of horses every year which could be devoted to productive use—the erection of buildings, the manufacture of tools, the laying of new steel highways of transportation, the building of bridges and of a vast number of other uses which would serve to create individual and collective wealth. Figuring the average amount of iron in a set of horse shoes to be 8 pounds and estimating these 25 million horses require at least 6 sets of shoes per year, the average horse, it is obvious takes about 50 pounds of iron from commerce or a total of 125,000,000 pounds per year. If this iron is worth 2 cents per pound we can charge $2,500,000 per year to the horse for another source of waste. If we consider the amount of leather utilized in the harness for 25,000,000 horses at an average valuation of $5 (a very low estimate) we have another economic loss of $125,000,000 in leather which should be utilized for providing shoes for human needs reducing the increased cost of this article of clothing due to the growing scarcity of the cattle supply in the entire world. Itemizing still further the economic losses which the horse inflicts upon society, let us consider the valuation of real estate occupied for the stabling of horses in 33 of our largest cities. By a very conservative estimate, one motor truck displacing 3 double teams can be housed in one-fifth of the space these three teams occupy in a building. Assuming as a concrete case that the estimated number of 140,000 horses on Manhattan Island were displaced at one fell swoop by motor wagons, we would have released for business and residence service an area of approximately 225 acres valued at an average of $75,000 an acre or a total real estate valuation of $16,855,000 approximately. But this is not all! The location of stables means the depreciation of real estate contiguous thereto. In every large city there are buildings devoted to housing horses, which have driven away manufacturing enterprises and private residences. In every instance it has been borne out that when a stable was withdrawn from a block or locality, real estate values immediately increased from 25 to 100 per cent. It is safe to say that the thousands of acres required for the housing of horses in 33 of our principal cities have a valuation that would reach into the billion of dollars. But this is by no means all of the economic waste for which the poor horse must bear the blame. Take New York City for example. Nearly $50,-

ROADMAKING BY AUTOMOBILE

This five-ton auto-truck trails eight yard wagons and roadmenders. During the summer of 1912 this machine pulled twenty cubic yards of broken rock over the rather level road shown in the illustration.

000,000 are appropriated from its annual budget for keeping its streets apparently respectable. The entire motorization of highway commerce on New York streets would perhaps decrease this enormous figure 75 per cent. It is not stretching the truth beyond its elastic limit to say that the saving to the taxpayers of the United States thru the complete motorization of our cities and towns would amount to $1,000,000,000 per year. Again the difficult to prove, but absolutely sure, human mortality by the use of animals in congested centers decimates our population by the thousands every year. The horse and the house-fly are inseparable companions and the latter breeds disease that cripples or kills many hundreds of every city's creative population.

But altruistic ideals have not dominated the business world to any extent in deciding problems which do not mean an immediate aggrandizement of their own interests. Therefore, the question of direct benefit in dollars and cents is of more concern to the average business man when considering a new institution than the knowledge that a concerted use of the new institution would redound to his material benefit. To justify the larger initial expenditure which the motorizing of his transportation requires, he must be convinced that the motor truck will make money for him. The subject of the economy of mechanical delivery over horse delivery is a very big one. It is purposely avoided here because nearly every motor truck installation has its own peculiar problems which are rarely duplicated in the same business. Again, cost data that are absolutely accurate in motor transportation are exceedingly difficult to obtain. There are two classes of users. One that does not keep any cost records and the other who will not allow the records to be made public property. In general, the prospective truck user who clamors loudest for cost records is the last man to turn any of his own records loose after he becomes a motor truck user. Finding that the motor truck is effecting a saving he does not care about the cost of deliveries or keep any individual account of the saving. The first class of motor truck users are having such success with motor transportation and are saving such large sums of money that they are

zealously guarding their secret, fearing that their competitors will use the same system of delivery and thereby invade their own territory. It is not uncommon to hear the remark "We don't want our competitors to know about the saving our trucks are making for us, and the longer they stick to the horse the better it is for us. We are not philanthropists —we do not intend giving them the benefit of our experience." The very strongest argument of the economy of the motor truck is the fact that the largest users of motor transportation in the country today are as silent as clams on the results that they have obtained from mechanical delivery. It is a certain fact that if these motor truck "fleet" users were not saving many thousands per year over their former systems, that a loud howl would go forth from them that the motor truck is a failure. There are many large department stores, breweries, contractors, lumbermen and meat and provision firms who are using motor trucks not by ones or twos, but in fleets of fifty or seventy-five and it is a noteworthy fact that there is practically no complaint against the motor truck by these large systematized organizations who are using motor transportation in a scientific manner. What little complaint that is heard comes from the small user who is employing his motor trucks in a haphazard fashion and according to his former horse standard.

Unprejudiced fairness to the motor truck demands the concession that the service it does is not properly comparable with horse service and for the following reasons:

Granting that in average service, one high grade motor truck will displace four teams—it must not be thought that it performs this work in the horse way. While it does the same service it does it in a different way—faster, surer, independent of weather extremes—independent of fatigue—independent of hours for rest and feed, free from bad temper, occupying less space in streets, docks, terminals, and the owner's garage; doing cleaner work, permitting the employment of more skilled and efficient labor, staying at the job without stops for 24 hours if required. As an emergency tool the machine has a dependability that no horse has. It can be taken off the job for months from the busy season of the owner's deliveries are over and its only cost is the interest charge and the "dead storage" rental value of the space it occupies. Again, both in theory and within reasonable practice the power truck never becomes a "dead horse." It can always "come back" due to the ease with which any "vitals" can be renewed when worn out and when constantly and intelligently repaired is always at the point of highest efficiency. Furthermore, the truck can deliver loads to restricted places—"back up" alleys, platforms and docks, etc., and unload with its own power where horses cannot go and where deliveries must be made with loads carried as near as horses can go and the load discharged piece by piece by tedious and expensive hand labor. Even a light duty motor truck will carry "on its back" a load equivalent to the pulling power of four horses with only one man in charge of it, as against two men as the minimum for equivalent horse equipment. If to take concrete cases the load is lumber or crushed stone in both cases, the two attendants for the horse equipment must be multiplied by two or three to get the load off, whereas the driver of the power winch equipped motor truck may, alone, and in a few minutes discharge his entire burden; hence it must be clear that it is the kind—the character of service, which power trucks do that vitiates any comparisons of them with horse trucks. The machine performs a quality of service in many respects which cannot possibly be done with horses, and consequently ought not to be judged in horse units. However, the force of habit and horse ideals cause it to be so judged.

Transportation efficiency doctors

are coming to appreciate that the purely utilitarian features of motor transportation are still but partially developed. Still we are prone to think only in terms of the horse utility. As a "traction engine" the horse's value is limited strictly to drawing the load. The traction and the carrying capacity functions of the motor truck represent its capabilities but partially. To orient the efficiency ideal of the motor truck still further, we must think of the easy adaption of its power plant for operating derricks and winches and cranes—even taking the crane and its load over a wide distributed area. The power winch equipped motor truck applies the engine power which propels the truck to load and unload, the selfsame engine may drive an electric dynamo carried in the truck to drive stationary tools in the shop—the engine's exhaust may be used to heat the truck to make the driver more comfortable or to protect a load of perishable produce from freezing; and vice versa. The power truck's versatile motor may operate a refrigerating plant carried on this truck to protect perishable products from spoiling in the opposite extreme weather. These subsidiary and constantly widening services of the power truck represent quality of efficiency, character of work for which the horse is useless.

Pelham, N. Y.

Plays for Parents

By Montrose J. Moses

[The children plays which are now so popular could hardly find a more sympathetic interpreter and critic than Mr. Moses, who for many years has devoted himself to the study of the two things here combined—that is, the drama and children's literature. He contributes every December to our Holiday Book Number a comparative survey of the juvenile literature of the year, and is the author of *Children's Books and Reading*, *Maurice Maeterlinck*, *Henrik Ibsen*, *The American Dramatist* and *Famous Actor Families in America*.—EDITOR.]

A wave of children's plays has swept over our theaters, bringing a wholesome breath of joy into the playhouse. Within the past month there has been the happy tread of youthful feet down the aisle, and eager, blazing eyes have gazed upon the mystery of the curtain. And when the picture has been revealed, when color and mechanical ingenuity have unfolded themselves, when the story has been enacted for the child-imagination, there is something to be thankful for in a theatrical season!

New York children, at the present time, are all going to the theater. Curls bob in the auditorium; suppressed whispers are heard on all sides when the orchestra begins to tune up, and there is excitement as tho on the eve of a private peep into fairyland. Strange to say, there is not one of these plays that will not, to a more or less degree, be patronized by parents and enjoyed by them. "How good they are for our children!" exclaim some mothers. "No, mesdames," we will say, in return, "these juvenile dramas are good for *you*. They will show you what *you* are in the eyes of your own children; what you are denying *them*. Look searchingly into these plays, mesdames, and you will be told what are the child sorrows, child joys, child longings and child fancies—all of which are facts to him."

Within the month New York has been deluged with children's plays. *Peter Pan* has again asked us if we believe in fairies, and has received a very emphatic "yes" from an eager public. Wherever we go, we find youth upon our stage. At the opera, there is *Hansel and Gretel;* at the vaudeville, there is *Puss in Boots*, while at the theaters there are *Little Women*, *Snow White*, *The Rackety-Packetty House*, *The Good Little Devil* and *The Poor Little Rich Girl*.

THE DOLLS' WEDDING
A scene from Mrs. Burnett's "The Racketty-Packetty House."

Is not this a varied dish to set before the child?

First and foremost, we meet a manager — George C. Tyler — who thru the generosity of Mr. W. K. Vanderbilt, builds a little playhouse, specially dedicated to the juvenile drama, on the roof of what was once the New Theater, in New York. The decorations in this garret-shaped place are conceits from the fables of La Fontaine and Æsop. But it is no better suited for children's plays than Winthrop Ames's Little Theater where, every afternoon, eager and shy and excited bows-in-the-hair, bibs - and - tuckers, lace - collars and open-mouths sit spell-bound before the diverse adventures of *Snow White.*

Two of the plays are given at grown-up theaters. Ask David Belasco whether *A Good Little Devil,* by young Rostand and his mother, is for children, and he will say: "It is *about* children." Then comes along Eleanor Gates, with a perfectly fresh and original story of a little girl, and she says: "My play is one of fact and fancy for anyone who has the imagination and child-heart to understand it." After all, it's a difficult thing to define a child's play, as it is to define a child's book. Whatever it be, if it is good, and true, and beautiful (meaning artistic), it is bound to catch young and old alike.

These children's plays are all worth seeing, and for many different reasons. *Snow White* has the essential fairy element in it, and in the different scenes it serves as a live illustrated version of a familiar story. *The Racketty-Packetty House,* in naïve fashion, teaches a moral and adorns a tale; driving home, in a satiric vein which parents will understand, that sometime a very old-fashioned doll's house is far better, richer and more comfortable than the latest style of mansion.

We all have our pet loves, children as well as grown-ups. Friends of *Little Lord Fauntleroy* and *Sara Crewe* flocked to the playhouse years ago when Mrs. Burnett turned her stories into dialog, and they went largely to see whether the stage figures were like what they were as imagined in the book. The same thing happened with the dramatization of Kate Douglas Wiggin's *Rebecca of Sunnybrook Farm.* And so it is with Miss DeForest's dramatization of *Little Women.* However unfaithfully the play may be acted, there is no doubt that the essential home spirit of Miss Alcott's story has been caught and deftly portrayed. It is wholesome and redolent with warm life; health-giv-

ing to the youthful spectator who goes to the theater.

Now, *A Good Little Devil* might have been considered a dramatization of Madame d'Aulnoy's old-fashioned French story, if it had not been freely adapted by Austin Strong, himself author of a play that undeservedly failed some years ago—a play called *The Toymaker of Nuremburg.* The alterations that befell the Rostand version were many, and so Belasco's drama about a boy has turned out a rather picturesque but somewhat artificial imitation of *Peter Pan,* with none of the spontaneous exuberance of the latter.

We hope that in the nursery, the tiny rulers thereof are already acquainted with Frances Hodgson Burnett's *The Racketty-Packetty House* in wee book form. If so, they know before they go to the Children's Theater that it tells the story of a pampered girl who, having seen an up-to-date doll's castle, brushes aside the house-her-mother-used-to-play-with—an act of thoughtlessness of which she soon repents. Then the dolls, inside the two houses, the one in rags and tatters, the other in silks and satins, come to life, and most of the play and story is about them.

We know that if mothers are real mothers, they will already have told to golden-locks or towsled-head every incident contained in Jessie White's fairy-tale play based on *Snow White.* So it is the pleasure of recognition, and the strengthening of imaginative experience, which the children enjoy when they are at the Little Theater. On the afternoon I saw the piece the atmosphere was tense with expectancy; I felt the pristine thrill of the audience. The Seven Dwarfs were like a dream come true, and Snow White, the reality of all my imagination, had once drawn from Grimm and Perrault. It was the gasp and gurgle of the nursery I heard around me, in what to the child was a palace of wonder and delight.

Snow White was more simple pictorially that *The Racketty-Packetty House,* more unified. The latter play, in the acting was unfortunately screwed up to a pitch of excitement largely due to the noisy enthusiasm of Master Gabriel, who headed the doll inhabitants of the Racketty-Packetty House. On the other hand

THE CRUEL AUNT
A scene from "The Good Little Devil" by Maurice Rostand and his mother.

Marguerite Clark, as Snow White, was child-like and refreshing and well mannered.

The Rostand play of *A Good Little Devil* is full of delicate fancy, with a human value to the story. The boy hero has a cruel aunt who is versed in the art of black magic, and who tolerates the lad only for the money which she knows will some day come to him, and thru him into her itching palm. Charles is starved and beaten and poked in a garret to sleep with the rats—very much as Sara Crewe was at Miss Mincheon's—and there he meets with the fairies who become his friends. But when the word *fairy* is mentioned to the aunt, she shivers and shrinks away, much as Mephistopheles shivers and shrinks whenever the cross is presented to him in *Faust*. In his waking hours Charles's companion is Juliet, a beautiful blind girl, on the verge of understanding what love means. Thus the play opens, while fantasy and grace carry us thru the trials and tribulations of Charles, with the flutter of fairy wings and the transformations in life which befall those whose wishes are immediately answered.

This gives Belasco opportunity to bring his mechanics into action. Charles is sent to school, and in the second act, Juliet awaits his first return in a garden of wonder cared for by the fairies. It is the glow of joy which the manager tries to throw upon the stage—and in his commendable effort he overdoes the fairy marvels of imagination. Yet the children will follow eagerly the figure of Juliet surrounded by the all too mechanical animals of the woods who love her, waiting patiently for Charles to come back.

THE POOR LITTLE RICH GIRL RIDES THE DOCTOR'S HOBBY-HORSE
A scene from Eleanor Gates's child play which pleases young and old in New York City.

But Mr. Strong failed to convey the force of the title in his character of Charles; the good little devil should have been a mischievous, all-

round little devil in order to cope with the terrible old aunt. Then all the more forceful would have been the final act where, coming back to see his aunt, now repentant and ill, Charles, caddish in behavior and forgetful of Juliet, suddenly awakens to the old life, and finds happiness, as the philosophy of Maeterlinck's *The Blue Bird* preaches, not far afield.

Eleanor Gates, on the other hand, is not self-conscious in the writing of *The Poor Little Rich Girl;* she tells it for the sheer joy of telling it, and with a novel imagination which has a fine strand of reality running thru it. For children? Yes. For parents? Yes. But, while it is a play children could easily relish, it is a play *parents ought to see.* Children should *make* their parents go, for there is unfolded a simple little plot of a rich girl, isolated from father and mother by society convention—all alone in a big house on Riverside Drive, or any other rich neighborhood your mind may conjure up in these modern days, and brought up by corps of servants, and battalions of governesses and dancing masters. But, tho rich, this little girl has an imagination richer by far. She hears around her strange terms which take fire in her brain. What does it mean when callers declare that her mother has a social bee in her bonnet; why do people believe Jane, the nurse, to be a two-faced thing? What a queer idea to speak of the governess as a snake in the grass! The Poor Little Rich Girl wonders furthermore how her father can be made of money; she marvels what sort of a being the King's English must be who is murdered all the time; she attempts to conjure up in her mind some picture of the little bird that tells people things, and she asks herself who "They say" must be. Here, then, is the lonely little girl who is neglected on Riverside Drive.

She falls ill—an overdose of poison given her by one of the maids—and the second act occurs in her delirium. All the quandaries of the first act come true. Eleanor Gates skilfully blends fact with fancy. Thru all the restless peopling of the scenes with figments of child imagination, the audience is made to feel that over the bed in the nursery somewhere in reality, a doctor, a father, and a mother are struggling to save a little life from passing out. Gwendolyn's questions are all answered here. The rich heart, weighted down with nursery restrictions when well, escapes into the sunshine of delirium, and she madly cavorts into the open, doing all those things that, had her parents been true to her, she would have enjoyed before, despite the fine feathers of wealth.

When the third act arrives, after the Poor Little Rich Girl has made her mother throw away the bonnet containing the social bee, which in turn releases her father from the necessity of making money all the time, the doctor has just pulled the child thru the crisis. In the third act, he was continually measuring her, and giving her hight in temperature degrees. Now, he is the family physician indeed, prescribing country air, association with parents rather than isolation in the nursery—and all the other nice things which go to make a happy home. And the final tableau is Gwendolyn's dream when she falls asleep: A country road in the bright summer sun; the boy of her nursery longing, Johnnie Blake, who was allowed to do anything; a dog; mother under a shade umbrella; father with fishing tackle; and The Poor Little Rich Girl, come into her own. This is the play. Into an audience of grown-ups, the message sank with a quiet, beneficient force, which was delightful to notice. Eleanor Gates has done something akin to Lewis Carroll—something which in the story as told in book form, we thought she would be unable to do.

These, then, are the plays sophisticated New York is going to see—rich and poor, young and old. Sedate men and settled women cried over the death scene of Beth in *Little Women;* we are never so grown-up that the sight of A Good Little Devil, or of a Poor Little Rich Girl will not reach the heart.

New York City.

THE BONE OF CONTENTION
Turkey would rather renew the war than surrender the Mosque of Sultan Selim II in Adrianople.

The Future of Turkey

By Herbert Adams Gibbons

[Now that the Lesser Powers and the Greater Powers are deliberating on the fate of Turkey in Europe, this competent discussion of the condition and prospects of the Ottoman Empire as a whole just received from an American scholar in Constantinople will be of especial interest to our readers.—EDITOR.]

The conference of London is the logical epilog of the decisive battle of Lule Burgas, Oct. 29 to 31, when the military power and military prestige of the Turks were irretrievably destroyed. The thunder of the Bulgarian cannon against the Tchataldja lines, which we heard distinctly in Constantinople on November 17, was only an aftermath to announce to the Turks in their own capital how sweeping had been the victory.

As we review the events of the past three months, they seem so stupendous and so far reaching in their results, that we are still wondering if we are in a dream. None here is saying now, "I told you so," for the most enthusiastic admirers of the Balkan peoples did not conceive of the rapid and astounding series of successes which have everywhere met the arms of Bulgaria, Servia and Greece. We gave the credit to the Turks for just one thing, and that was their fighting ability. While many believed that Bulgaria could put an army in the field which would in the least hold its own against the Turks, where is the man who would have prophesied Kirk Kilisse and Lule Burgas? As for Servia and Greece, in my

large circle of friends who are intimately acquainted with the life and resources of these States, I cannot recall one who did not honestly believe that the Turks would make "easy meat" of the armies of the two Crown Princes. We were all doubting Thomases here when we heard of the Servian victory at Kumanova and the Greek bloodless entry into Salonika. Why not confess it now?

The wiseacres are beginning to ask, "Will the breakup of the Ottoman Empire really come in 1913?" This event has often seemed imminent since the Austrian Ambassador at Constantinople wrote to Vienna in 1807. "This cannot last much longer!" Living in the days of his great-great-grandchildren we are wary of setting a date. And yet we do not hesitate to declare that if the Turk survive this war, which has changed him from the Sick Man of Europe to the Sick Man of Asia, it will be one of the miracles of history.

The optimist looks at the map, and says: "In spite of the appalling loss of territory (one-tenth), of revenue (three-tenths), of population (one-fourth) and of military and naval prestige (all), Turkey still retains enormous possessions, comprising Asia Minor, Mesopotamia to the Persian Gulf, the Red Sea littoral of Arabia, Syria and Palestine, with tributary rights over Egypt and Cyprus, Constantinople, the Queen City of the world, is still the capital. The Star and Crescent waves over Smyrna, Brussa, Konia, Angora, Erzrum, Trebizond, Bitlis, Harput, Mosul, Bagdad, Aleppo, Adana, Beirut, Damascus, Jerusalem, Medina and Mecca. Surely this is an empire."

The European press is already beginning to speak in this wise: "The Turks have now rid themselves of one more thorn in the flesh—a country which has brought them only expense, unending strife, and economic and political unrest. It was a surgical operation, which hurt for the moment, but which will ultimately do the patient good. The Turks are free now to devote themselves to the development of what is no mean empire, comprising practically all the conquests of Alexander. Let them go back to Asia and show us that they are a nation fit to live."

The arguments of the optimist and of the European press look plausible. But they do not take into account the nature of the Ottoman power and the history of its extension over Asia Minor, Mesopotamia, Syria and Arabia. The Turks are a people who never have possessed, and who do not today possess, the genius of government. They won their empire by knowing how to fight better than their neighbors. Up to the time that war became a science of organization and discipline instead of the ability to put into the field an unlimited supply of men willing to die, Turkey could match any nation in Europe. During the past hundred years they have held their empire thru clever diplomacy, which has known how to profit by international rivalries abroad and racial and religious rivalries at home. Now that "the integrity of the Ottoman Empire" is no longer a fetish of European diplomacy and the Christian "ex-slaves" I take this expression from a recent issue of a local Turkish newspaper), are united, Turkey has had to rely upon brute force to maintain her position before the world. Since this final argument has been lacking, what is left? Nothing, as far as Europe is concerned. But how about Asia?

When we realize the fact that the Ottoman Empire, in its territorial development, has been wholly a European power, and that the Turks conquered Asia from Europe, and not Europe from Asia, there must be same misgivings for the future. Adrianople, not Brussa, was the first real capital of the Turks, and it was on the battlefield of Kossovo that their empire was born. It was not until after they had successfully matched their arms against Europe that they were able to extend their empire into Asia. This follows historical precedent.

RESTING ON THEIR ARMS
The troops camped along the Tchataldja lines are waiting the result of the London Conference.

Asia Minor has never been successfully held under one scepter unless the conquest was made from Europe and the seat of power continued to remain in Europe. Darius broke the power of Croesus, but he could not possess the country. But Alexander the Great, coming out of Europe, left an influence in Asia Minor which still remains. The Romans won their first great battle in Asia Minor at Magnesia, 190 B. C. But their foothold was not permanent until they had destroyed the Macedonians at Pydna, 168 B. C. The power of the Byzantines in Asia Minor shrank in proportion to their successive losses in Europe. When they retained in Europe only Constantinople, the Marmora littoral and the peninsula of Gallipoli, their dominion in Asia extended no farther than the eye could see from the dome of Saint Sophia! The Seljuk Turks failed signally to build up an Anatolian Empire with Konia as the capital. But their Ottoman kinsman succeeded by going to Europe first and then coming back to conquer.

Syria has always been the apanage of Egypt or Mesopotamia. It is divided from Asia Minor by the high Taurus range and again by the Amanus. The Ottoman Turks assured themselves of the possession of Syria by the conquest of Egypt. Napoleon and Ibrahim Pasha had no difficulty in entering Syria. It was not the Turks who turned them back.

The possession of the Hedjaz and the Yemen, with the sacred cities of Mecca and Medina, and of the Khaliphate itself, was secured by the Turks thru the conquest of Syria and Egypt. It was part of the heritage of the Abbassides which Sultan Selim I. gathered in, The Yemen was never really conquered, and has become practically independent within the past year. To maintain the dominion over the Hedjaz, the Turkish government has built a railway upon which it is spending annually two and a half million dollars in excess of receipts.

If Turkey had maintained her military power and prestige in the Balkan war, there might be some

hope for the future. If all the racial elements in her Asiatic possessions were congenial and loyal and sympathetic, there might be some hope for the future. If the Turks possessed any administrative ability, or the germs of it, there might be some hope for the future. If Turkey had any financial resources, or any means of getting money for economic development without continuing to sell her independence to foreign capitalists, there might be some hope for the future. But after the rout from Kirk Kilisse, the defeat at Kumonova, and the ignominious surrender of Salonika, the Turks are no longer the proud dominant race in the eyes of the races inhabiting her Asiatic provinces, and over whom they have "lorded it" for centuries. The Arabs, fanatical Moslems, are beginning to ask whether the Turkish Sultan, as Caliph, has shown himself to be the "defender of the faith." Arabs Kurds, Druses, Armenians, Greeks hate and despise each other, but not as much as they hate and despise the Turk. The Turks never have shown, and never will show, the administrative genius necessary to unite the races of the Asiatic provinces, to construct a genuine constitutional form of government, and to develop the economic resources of the country. There is no money in the Turkish treasury, and the burden of debt is heavier than ever before. If foreign capitalists develop the resources of Asiatic Turkey, their *quid pro quo* will amount to what is practically ownership. Woe to the vanquished is not as terrible and merciless a cry as woe to the penniless!

This is a gloomy picture I am painting of Turkey's future, but it is a true one. In Asiatic Turkey we must be prepared for a separatist movement, whose least result will be autonomy on the part of the Arabs, and a possible extension of French protectorate over Syria. The annexation by Russia of the provinces inhabited mostly by Armenians is not an impossibilty. Ultimately, Germany will have something to say about Asia Minor proper and Mesopotamia. The Turks, as a ruling race, seem doomed to disappear.

Constantinople.

A Professional Servant

An Experience Showing How Even a Housemaid May Find Happiness in Her Work

By Inez A. Godman

I walked the elm arched roadway with lively step and watch in hand. These New England cross-country trolleys wait for no man, or woman either.

Now, in the South a woman counts for more. The conductor comes to your seat, takes your parcels, steps into the road, lifts your umbrella, and helps you down.

Likewise, the motorman sees you coming down the cross road and waits most obligingly while the conductor comes a bit to meet you if you are heavily laden. The Southern women consider this quite the correct thing and would scorn a conductor who was not enough of a gentleman to put both himself and the company out a bit in order to be of service to a lady.

However, Connecticut is not North Carolina and here comes my car. I sprint up to the corner just as a doorway opens and a matronly person issues forth to mount the steps beside me.

Now I have a weakness for matronly persons and this one was particularly my favorite type; plump, with soft curves and smooth gray hair.

I care but little for the portly dame with molded figure and fluffy hair waves. When she sits up straight in her long corset, all of my imaginary babies spill out of her lap—no, I will not call it a lap, it is too stiff and slippery; and it would surely be impossible to cuddle one's cheek against her polka-dot veil. But this person's appearance was most promising and we had the front corner of the car just for "we two." Don't you just love the front seats in a cross-country trolley?

Well, I smiled and she returned it—such a pleasant twinkle. I was flushed and disordered and, of course, had to explain my tardy habit acquired in the moderate South. She remarked as she helped me adjust my bonnet that thrifty New England women were sometimes behind also, and we were friends for the trip. She was bound for the same near-by city as myself and so we planned lunch together.

"I am very fond of Shirley's salads," she said. "There is a flavor about them that I cannot acquire at home.

I was a bit surprised, for while she was thoroly well dressed there were no evidences of wealth about her. The little watch was silver and her silk gloves were daintily darned.

"Is not Shirley's expensive," I asked.

"A salad with coffee costs no more than a dinner elsewhere and it is much more of a treat to me than an ordinary meal. I get plenty of such at home."

"Shirley's it is then," I agreed. "Going to the Library?" for she carried a book.

"Yes, we have an unusually good village library, but I am especially interested in cacti and such books as this"—she opened her volume to exhibit the fine illustrations—"I get from the city."

She was such an enthusiast on the subject that I gave myself the pleasure of turning the leaves while she expatiated thereon. Every few pages she would say "I have that one," and then launch into its history.

"Have you a greenhouse?" I asked.

"No, just a southerly bay window."

"But how do you find time for it? You must have good maids."

Such a merry gurgly laugh as bubbled out between her white teeth, such a ripply motion as spread over her shoulders.

"Why, I'm a maid myself."

I stared. She laughed again.

"It is not at all necessary for a maid to be a slouchy Irish person."

"No," I said, "all maids are not slouchy nor all Irish maids either. But you! And you came out—" I caught myself.

"Yes, surely. I never lived in a house yet where the front door was denied me. It all depends upon what you are, you know."

"No, I don't know. Please tell me."

"Tell you what?"

"Why, just your condensed history. I'm a stranger here. Do such as you happen often hereabout? Can I get one?"

Her eyes twinkled. "I'm not at all sure that you could keep one."

"If I had a maid like you she should use the front door all she wished," I replied fervently.

"But maids like me have to be made, and I don't believe you'd do it. It's atmosphere."

"But atmosphere won't do it all."

"True, but I don't believe that the atmosphere of your home would attract any kind."

I sighed. "Please tell me how you began."

"My father died when I was ten. My mother struggled on with her three little ones and died when I was fourteen. A kind woman then took me to be her helper, but after one year of it I left to seek more congenial employment. I floundered about for two whole years and nearly fell into wickedness when a woman of great sense hired me, told me how to make a profession of housework, called me housekeeper, and allowed me—out of work hours—the same privileges as her own daughters.

Blessed little woman! I was courted on her veranda and would have been married from her parlor had the young man lived."

"And are you with her yet?"

"No, my little Madam has been dead many years and I have been in three families since."

"And do you always find places with the necessary atmosphere?"

"Yes, in country villages. My first change took me to a good home with a woman who had known me when I was with the dear Madam. I remained at this place five years and then found it necessary to move to another town. My first position there did not suit me and I soon left. I was idle some weeks looking for just the right place. People are so accustomed to the ordinary servant that to find a *home* is somewhat difficult, but I finally went to help a woman temporarily who was just up from a severe confinement. She recognized my ability and arranged her household so that I was content to remain. I stayed with her till she broke up housekeeping on account of poor health.

"Then I secured this *home*." She spoke the word tenderly, "and have been there four years. I shall stay as long as my strength allows, but I am beginning to fail a bit and must look out for old age."

We were nearing the city and the car became too crowded for further talk. I accompanied my new friend to the bank and saw her deposit $40 to an account already over $3000. We enjoyed Shirley's salad together and after an hour of quiet in the Library I found her most helpful about my shopping.

Then she asked if I would like to go with her to look over a house she had thoughts of purchasing. Of course I did like. On a pleasant street, but a few rods from the trolley, was a building suitable for a small rooming house. It was not new, but appeared in good repair and was priced at $5000.

"I think this will make me a comfortable home for my old age," she said thoughtfully. "These two rooms will be all that I need and the little yard can be made attractive. The rental of the other rooms ought to support me."

"Would you come now?"

"No, I have a cousin who will take charge for a while. I want to work as long as I can and earn enough for a southerly bay window." Her eyes twinkled at me.

"Well," I said, "there is a fine chance for one in this very room."

"Yes," she said. "Yes." Then looked soberly out at the tiny yard. "It will be very cramped after my present surroundings, but we must all grow old and I shall like to *own* a place."

We rode back on the same car and I ventured some very personal questions which she answered freely and gladly.

"No, I would not advise any girl to do housework in another woman's home if she could do it in her own. I think the best thing any young girl can do is to marry if the right opportunity offers; and she should not place herself where good opportunity cannot offer. The place for a girl to receive her courtship is under the home roof, of course. If a woman takes a young girl to do her housework she should either give her free hours for society at home or else give her pleasant surroundings and supervision for society under her roof. If for any reason a girl does not marry, housework is a good profession providing she makes a *profession* of it and does no slouch work."

"Ah-ah!" said I reminiscently.

She twinkled again. "You 'ah-ah' more easily on your side of the case than on mine."

"Naturally. I know you do fine work. It is written all over you."

"I know my business," she replied tersely. "I have made a point of knowing it, and I do it systematically and thoroly. If the mistress requires too much of me I tell her so."

"Do you wash?"

"No, but I iron."

"And cook?"

"Yes, and help with the cleaning, and sometimes with the sewing. I do no chamber work except in emergency."

"And you have saved enough to buy the home?"

"Yes. In doing housework one has but few expenses, and I have saved an average of $125 a year."

"On what wages?"

"Usually $4 a week. I had $5 for a while but now I would rather take less and have less work."

"You have some place of your own to sit?"

"Always. I own a good rug, two easy chairs, a pretty table, lamp, couch, bookshelf and clock. When the kitchen is large I make a cozy corner there, but in my present home I have the bay window end of the dining room. However," she twinkled again, "the family are as much in my window as I in their parlor."

"Well," said I, "if there were more like you the servant problem would be solved."

"I beg leave to differ. There will be plenty like me when the places offer. The mistresses are absorbingly selfish. They want the entire time and strength of the maid devoted to the interests of the mistress. The reason the southern women sing the praises of the old mammys is that the mammys were absorbed in the mistresses' affairs and had no individual life of their own. If mistresses ever come to realize that the maid has an individual existence and individuality of development due to her, the servant problem will be solved. Otherwise the individual home will be swallowed up in the labyrinths of the apartment house." She gathered up her bundles and looked me squarely in the eye.

"When a refined, intelligent person lives among those of like character they naturally drift into companionship, and the housekekeper is no more a menial than the teacher, unless she chooses so to be. If you are interested to hear more about my cacti come to the Woman's Club next week. It meets at our house."

She waved her hand, passed up the side yard of her home and stopped to pat the cat that came to meet her.

A feeble old gentleman came from the back yard with a basket of greens. She laid her bundles on the steps, took the basket and slipped her hand under his elbow.

Thus they entered the kitchen door together, and his pleasant wavering voice floated out joyously—

"Mother, Mother, Lucy's home again and I smell pineapple in her bag."

Madison, Conn.

Peace

By Preston William Slosson

Transmute the ancient valor of arrow, pike and sword,
The virtues which the weary march and the battlefield afford;
Courage and faith reblazon for the needful work of peace,
The common tasks that still remain altho all warfare cease,
And the daily toll of vigilance demanded by the Lord.

Peace among sons of Adam; ally ye, all good folk;
Revolt in a common effort against a common yoke.
War to the hilt with nature, conquer from cloud to soil;
Air and ocean before you lie vanquished by common toil.
Win freedom as ye did from men by stubborn stroke on stroke.

But none may strive with nature with sword-blades torn by rust,
And defeat awaits the army dissevered by mistrust,
First must we cleanse the nation of greed and hate-born lies,
And forego unequal favor as a willing sacrifice.
O God! above all blessings, make Thou our country just!

New York City.

SECRETARY KNOX: "Since I have to sit here a while yet why not make the Hay-Pauncefote Treaty useful!"

THE NEW BOOKS

William Vaughn Moody

My heart could break
Of its long searching and its finding not.

These lines from the "Moon Moth" provide the key to the works of William Vaughn Moody.* They are tragic lines and they open to a tragic world of rich and varied beauty, truly, but a world of doubt and passionate questioning and of continual conflict that saw no prospect of peace. In the prose plays as well as the poems and poetic dramas the poet paints the same world. The battlefield may be the heart of a Prometheus, a Raphael, a Ruth Jordan or a Michaelis, but the battle is his own. He sees all creation in the light of the eternal struggle between the things of the spirit and the things of the flesh. This conflict nearly or remotely underlies all poetry; but Moody, unlike other poets, is more interested in the theological problem involved than in the situations and characters he creates to interpret it. Much of his work thereby appears detached, remote from what to most of us is real. For we do not look upon the world theologically these days. Abstract problems of right and wrong have little interest for us, and we cannot take very seriously a fallible Old Testament Jehovah who ponders and plans and makes his mistakes like a human being. Moody evidently did. He was a man of intense religious feeling, almost a mystic, and he was born into a world yet in its first stupefaction at the revelations of modern science. His intrepid, inquiring mind was manifestly torn lifelong by a struggle to reconcile the material with the spiritual, that which he observed with his eye and heard with his ear, with that which his soul intuitively believed. The tragedy of his life lies in that he could not reconcile them, that these forces were in their essences irreconcilable. He strove to serve two masters, and to be loyal to both, and by both he was rewarded with restlessness and an unsatisfied heart.

Moody was, first and last, puzzled by the drama of life. He saw the intense, consuming beauty, but he could discern neither the motive nor the issue.

We have heard a voice cry "Wander!" That
was all we heard it say,

he sings in the "Road Hymn for the Start," and the same note occurs again in "Gloucester Moors," and again in "Old Pourquoi":

Pourquoi? Pourquoi? Yes, that was all!
Only the darkest cry that haunts
The tragic corridors of chance—
Only the bitterest wail flung out
From worlds that traffic to their mart
Without a pilot or a chart;
With "What?" the body of their doubt,
And "Why?" the quaking heart.

In "Good Friday Night" we find the first expression of the conflict of the spirit and the senses in that struggle between the Christian and Pagan ideals which was to be with him until the end. More dramatically the idea reappears in "Second Coming." In the former poem he had been gratefully submissive to the vision of the Christ that had appeared to him; in this, he is rebellious:

Yes, I have loved thee—love thee, yes;
But also—hear'st thou?—also him
Who out of Ida's wilderness
Over the bright sea-rim,

With shaken cones and mystic dance,
To Dirce and her seven waters
Led on the raving Corybants,
And lured the Theban daughters

**Poems and Poetic Dramas. Prose Plays.* By William Vaughn Moody. 2 volumes, 8vo. Boston: Houghton Mifflin Co. $1.50 each.

To play on the delirious hills
Three summer days, three summer nights.
Where wert thou when these had their wills?
How liked thee their delights?

At the end, smitten by the glory of the face, he cries, bewildered:

Hast thou yet more to say that men
Have heard not and must hear?

but he cannot forego the tangible loveliness of the world. His eyes and ears were more sensitive than those of most men to the splendor and music of earth. He could not deny ultimate reality to what they brought to his treasure-house. The parable of a certain rich man comes inevitably to mind, "And he turned away sadly; for he had great possessions."

This same wavering between the demands of the senses and the demands of the spirit wrecks *The Faith Healer*. Michaelis serves two masters, passion and the healing Christ. He comes to grief, and no statement on the part of the dramatist that Michaelis's healing power is restored because the woman he loves is herself in dire spiritual need can persuade us that it is so. No man can pursue a human passion and at the same time successfully cleanse the multitude with the pure fire of his faith. The play is psychologically wrong.

Moody's attempt by process of reason to reconcile things material with thing spiritual and make them dwell in harmony together came to no end. His poetry will be remembered not for its philosophy at all, but for its sheer beauty and passionate humanness. Thru love and beauty, indeed, he solved, for dazzling instants, the very riddle which his philosophy could not rede. He brought about the only possible conciliation between the material and the spiritual in those shining passages in which he was least conscious of the distressing enigma of life, most conscious of its beauty, and was able gloriously to express in terms of earth that which the heavens declared. Here, for instance—It is Raphael in the Prelude to "The Masque of Judgment" who speaks:

Another night like this would change my blood
To human: the soft tumult of the sea
Under the moon, the panting of the stars,
The notes of querulous love from pool and clod,
In earth and air the dreamy under-hum
Of hived hearts swarming,—such another night
Would quite unsphere me from my angelhood!

And again:

O heart of man, how I have loved thee!—
O dreamer! O desirer! Goer down
Unto untraveled seas in untried ships!
O crusher of the unimagined grape
On unconceivéd lips!
O player upon a lordly instrument
No man or god hath had in mind to invent;
O cunning how to shape
Effulgent Heaven and scoop out bitter Hell
From the little shine and saltness of a tear.

There is prodigality of beauty thruout the trilogy; beauty of imagery most in the "Masque of Judgment"; beauty of importunate, unexpected harmonies most in "The

WILLIAM VAUGHN MOODY

Fire Bringer"; everywhere the beauty of a great spirit straining toward the light:

Of wounds and sore defeat
I made my battle stay;
Winged sandals for my feet
I wove of my delay;
Of weariness and fear,
I made my shouting spear;
Of loss, and doubt, and dread,
And swift oncoming doom
I made a helmet for my head
And a floating plume.
From the shutting mist of death,
From the failure of the breath,
I made a battle-horn to blow
Across the vales of overthrow.
O hearken, love, the battle-horn!
The triumph clear, the silver scorn!
O hearken where the echoes bring
Down the grey, disastrous morn,
Laughter and rallying!

"The Death of Eve," fragmentary as it is, has a simple grandeur that neither of the complete members of the trilogy with their rather confusing cosmogony and their not invariably interesting theological discussion, possesses. The figure of Eve is the most tremendous creation in modern English drama.

How much of Moody's work will survive the relentless scrutiny of posterity is a question beyond the surmise of contemporaries. The world will treasure what it needs. Whether the bulk be large or small is unimportant. We may be sure that future Americans will remember Moody gratefully as one not unworthy to walk in paths first trod by the feet of Milton and of Shelley.

HERMANN HAGEDORN.

Modern Japan

Dr. Inazo Nitobe's *The Japanese Nation** is a collection of lectures which he delivered last year in six American universities as exchange professor. In his preface the author explains that

the idea of sending public men of note unofficially from this country to Japan and from Japan to the United States owes its inception to Mr. Hamilton Holt of New York City. When his plan had been developed to a certain degree of feasibility, the task of carrying it into effect was accepted by President Nicholas Murray Butler of Columbia University.

The intense nationality and patriotism of Japan, and her freedom from foreign invasions, says Dr. Nitobe, have been due to the waters surrounding the five hundred and eighteen islands. Thus, in his first lecture on the East and the West, he speaks of two million people engaged in fishing, and of the lack of live-stock due to the discouragement given by Buddhism and Shinto to the slaughter of animals. He mentions baths at a temperature of 120 Fahrenheit on account of atmospheric humidity, four earthquakes a day, four hundred and thirty mineral springs with medicinal virtues. He tells of an empire covering about twenty-eight degrees of latitude with a width of from fifty to two hundred miles. But highly essential, if we would know Japan, is some appreciation of the Japanese flora. Dr. Nitobe names the flower of each month: the pine for January; the plum, which unfolds its colored buds when snow is falling, for February; the peach for March; the cherry —frequently used for making a beverage — for April; the wistaria (named after Dr. Wistar, who introduced it into America) for May; the iris for June; the morning-glory for July; the lotus, corresponding to our lilies in religious significance, for August; the "seven plants of autumn" for September; the chrysanthemum—its petals for salad and leaves and flowers for fritters—for October; the maple for November; the camellia for December.

Every country has its myth, its history, and its national anniversary. According to Dr. Nitobe, the Japanese book of Genesis is composed of *Kojiko* (records of ancient things), *Nihongi* (chronicles of Japan), and *Kogashu* (ancient records). Corresponding to our Fourth of July, the Eleventh of February—on which day sixty-six hundred years ago Jimmu

**The Japanese Nation.* By Inazo Nitobe, A. M., Ph.D., LL.D. 8 Volumes. With a Map. New York: G. P. Putnam's Sons. $1.50.

Tenno (the Emperor of Godlike Valors) ascended the throne—is still observed as the anniversary of the foundation of the Empire.

There is an interesting discussion of the introduction of Buddhism into Japan, the unification of the religion and politics, their separation, the influence and decline of Buddhism. Not less entertaining is the author's narrative of five periods in Japanese history—pre-historical, artistic, militantly feudal, peacefully feudal, and occidentalized or restored. The new Japan began with the abolition of feudalism in 1871, and the establishment of a standing army and representative government in 1889.

In the chapter on Race and National Characteristics the author gives a vivid description of the physical make-up of the Japanese people. An average Japanese, he says, has small limbs, short legs and arms, long fingers light-brown skin, black hair, a large head—probably due to the extensive consumption of fish—a medium nose, and a round or long face. But Dr. Nitobe forgets to mention the almond eyes which also form a national characteristic. According to the Japanese, a woman of beauty possesses "a long, white, slender and gracefully curved" neck, a high and narrow straight nose, a cherry-hued complexion, and a medium stature. She should also be "softened by eternally feminine modesty and gentleness of expression, and heightened by faultless refinement and gracefulness of dress and manner." Dr. Nitobe says that the Japanese have a strong imitative faculty and quickness of perception.

According to the writer, the Japanese conception of religion "begins in instinct, gains volume by sentiment, and grows in strength by emotion." At present, Shinto, Buddhism and Christianity have attained national importance, while Confucianism, Taoism and Mohammedanism do not command public attention. Shinto, or "the way of the Gods," the religion of the reigning house, has no sympathy with the fall of man, but believes in the inborn purity of the human soul. Irrespective of the various religious influences the people, says Dr. Nitobe, believe that the dead live again somewhere and somehow. As a result, the anniversary of the dead is observed, and ancestor-worship still goes on. Turning from Japan to the United States, the writer finds that our "kissing-margin" is overstepped, and therefore unsanitary. He disapproves of the exposing of women's shoulders in the ballroom; and "If marriage is divinely ordained, what sanction has divorce?" he asks.

In the chapter on Education Dr. Nitobe says that the inception of modern education in Japan was due to the inspiration received by two Japanese statesmen as witnesses of an election in San Francisco. When the statesmen returned home, they urged the government to start educational reform, and to educate the public in order to keep pace with the Western world in citizenship and progress generally. Steadily, from that time on, Occidental civilization and ideas have been introduced. Dr. Nitobe illustrates the success of the Japanese colonial policy by the case of Formosa, with an area of 14,000 square miles. He enumerates with pride such work as the extermination of brigands, abolition of opium-smoking, extinction of malaria by means of sanitation, and the picturesquely scientific subjugation of head hunters. Finally, he generously praises the part of the United States in the upbuilding of the Empire of the Rising Sun.

Dr. Nitobe has done his duty to his country and to the United States most creditably. His book is the best brief interpretation of modern Japan yet publisht.

Notable selections from the writings of Rev. Dr. Floyd W. Tomkins, which make prominent the notes of comfort, encouragement and sympathy, have been brought together by Mrs. Winthrop C. Knowles and publisht in a volume entitled *Sunshine on Life's Way*. (Dutton; $1.25).

Chicago's Beginnings

Most of our earlier western towns have grown from settlements near carefully located military posts. Hence behind the brief history of Chicago runs the briefer but tragic tale of Fort Dearborn, its foster-parent. The former mouth of the Chicago river, burden-bearer of sewage, whose reversed flow is now away from the source of its acquired foulness, was immemorially a rendezvous of the aborigines, presumably for council, certainly for barter. The Illinois clan (not altogether exterminated by the Iroquois in 1770) and Ottawas, Chippewas, some Winnebagoes and Miamis, and above all Potawatamies, prairie Indians and woods Indians, frequented those waters in succession and together. For an indeterminate period, reaching back into the French régime which ceased in 1763, traders of white and mixed blood had cabins near the river's mouth; and because the Indians could easily be met there, a small garrison was established hard by in 1803. The "Fort" was a double stockade, whose lines converged on two diagonally opposite two-story, block-house bastions. On the seventh of August, 1812, orders came from General Hull to evacuate Fort Dearborn. These were explicit, presented no alternative, and were carried out to the letter. The command, four officers, sixty-six soldiers, and twenty-seven women and children, started to march to Fort Wayne with a Potawatamie escort on the fifteenth of that month. Within an hour their own Potawatamies attacked them, and under conditions of peculiar atrocity killed at least two-thirds of the party. The site is marked by a monument at the foot of Eighteenth Street in Chicago.

What has here been condensed, and more, is detailed in this little contribution to local history, which, notwithstanding occasional repetitions and a somewhat rambling style, is quite worth reading.* The writer makes a plausible effort to establish the wild onion (*allium cernuum*) "chi-kaug-ong," as sponsor for Chicago, instead of the better known and still less attractive derivation. As a contribution to the theme, however, it may be said that an intelligent Indian friend of the reviewer, a Miami who had been adopted by the Shawnees, told him, without prompting, more than fifty years ago, that Chicago meant *mephitis mephitica*, using the vernacular. The real hero of this narrative is the Trader, John Kinzie, a corrupt diminutive of Mackenzie. He was a friend of the red man and of the white, and his courage, intelligence, and forceful character have made him the pioneer representative of the Chicago type. He should be canonized as that town's patron saint. A considerable posterity, adorned on one side with beauty and vivacity, and equipped with vigor on the other, have been a credit to his blood.

**The Story of Old Fort Dearborn.* By J. Seymour Currey. 8vo., pp. 174. Eleven illustrations. Chicago: A. C. McClurg & Co. $1.

Woman Tomorrow

The author of *Woman and Tomorrow*† states that any discussion of feminism should be stimulating—as his own book certainly is. With many of its suggestions the rank and file of feminists will not agree; with the restricted conception of woman as an industrial worker, for example. Certainly we disagree with Mr. George's opposition to co-education—which he views as a destroyer of the mystery of sex, quite as if the passion he conceives of so finely did not create its own mystery, and the mystery of sex needed to be institutionalized.

In discussing child-bearing Mr. George is as obsessed as the Australian black fellow or continental European by the need of shielding these same mysteries. "Offspring," he writes, "should be natural and accidental, not intentional"—an opinion held, we suspect, by no woman who has borne more than one child, and thinks for herself.

But, after all, despite taboos, sex is not the fragile thing it seems to

†*Woman and Tomorrow. By W. L. George.* London: Herbert Jenkins, Ltd.

appear to Mr. George and the professional directors of sex with whom he consorts—only momentarily let us hasten to add. To transform the world into anything like Mr. George's vision of it, sex needs freedom, not the apprehensive care it has always got. But this is merely saying what in general Mr. George himself says, and much better.

As for the case as a whole of the "new new-woman," Mr. George states it with the utmost sincerity, refusing either to be side-tracked by the irrelevancies of the past or to be tempted into setting a rigid frame for the future. Feminism he defines as a state of mind. Hence feminism is "infinitely more greedy than suffragism." "Feminist action is directed against attitudes rather than against situations; its desire is to abolish in men a state of mind which it considers evil, suicidal, and cruel. . . . We want a mental recognition of status. . . . It is not what women may do that matters, but the taking for granted of what they may do." Speaking more concretely, "we do not think it material that girls should learn engineering, but we do wish to attain a social condition where no one will be surprised because they learn engineering."

Washington and Lincoln

Mr. Robert W. McLaughlin essays the task of comparing the two great Presidents, *Washington and Lincoln*, both as men and as administrators (Putnam). As a background for his two figures he pictures in considerable detail five critical periods in the nation's life—those of 1765, 1776, 1787, 1830 and 1861. Both in the science of government and in the actual work of government Lincoln is rated far above Washington. The problem of the exercise of power thru government is one with which both had to deal thru weary years. Both exercised administrative power with prudence, charity and an essential goodness of nature. Both looked upon power through law as derived from the people; but whereas Washington saw the people in the law, Lincoln saw the law in the people. One was aristocratic in temper of mind, the other democratic; one was conventional, the other unconventional. The two presidents were, however, of an equal simplicity and sincerity. Lincoln's mastery of men was greater than Washington's, and far greater yet was his mastery of language. His thought clothed itself in the inevitable phrase, individual and distinctive, whereas Washington's language, even when his own and not that of his ministers, is unmarked by any special characteristic. Both men grew by contact with responsibility. Yet with the one there was distinct reaction from the extreme democracy of 1776 to the qualified republicanism of 1787 and later, while with the other there was a progressive broadening and deepening of faith in democracy till the last hour. There is nothing of striking novelty in the work. It deals largely with the obvious. Yet it is a sincere and painstaking study, and will help to a better understanding of the resemblances and contrasts between our two foremost Presidents. The work is illustrated with portraits.

Literary Notes

A small volume well stored with workable plans and methods for organizing and sustaining *The Ideal Adult Class in the Sunday School* (Pilgrim Press, 50 cents) has been prepared by that experienced leader, Mr. Amos R. Wells.

A commendable feature of *The Riverdale Hymn Book* (Revell, $1.25), edited by Rev. Ira S. Dodd and Prof. Lindsay B. Longacre, is the inclusion of an unusually large number of hymns, giving expression to the social impulse and ideal.

Mr. Herbert Kaufman treats his readers to a bit of wholesome, practical philosophy, served in a pithy style, as he tries to spur them on by rebuke and caustic comment to *Do Something! Be Something!* (Doran, 75 cents).

Mrs. Grace Duffield Goodwin's little book *Anti-Suffrage* is perhaps as good an argument as can be made for a bad cause. The reader's impression will be in favor of the author if not of her conclusions. Sometimes one is startled as when, in the chapter *the four classes that menace*, we read of Southern States "where the negroes number five to one or ten to one." We know no such States. The account given of the actual workings of woman suffrage in the States that have had it longest is altogether misleading. (Duffield, 50 cents.)

The Mission of Victoria Wilhelmina, by Jeanne Bartholow Magoun, is a plain and convincing record of the lessons a country girl learns in the city (Huebsch, $1).

John J. MacFarlane, librarian and statistican of the Philadelphia Commercial Museum, has prepared a handbook of *Manufacturing in Philadelphia,* 1683-1912, with illustrations. (Pp. 97, Philadelphia Commercial Museum.)

A sugar-plum book to be nibbled in the intervals of serious reading is *The Melting of Molly,* by Maria Thompson Daviess (Bobbs, $1) : the melting being both figurative and literal, since the fascinating widow has grown too plump.

The author of *Keeping up with Lizzie* again attacks pseudo-fashionable extravagance in *Charge It*—where Mr. Irving Bacheller's admonitions are pungently exprest by Mr. Socrates Potter, self-described as "an honest lawyer." (Harper, $1.)

In *The Problem of Religion* (Pilgrim Press, $1.25) Prof. E. C. Wilm gives a popular but well reasoned justification of religion on both its philosophical and its practical sides. The book is the outcome of wide reading and clear thinking and reveals an attractive individuality of expression.

Dr. R. J. Campbell has published a number of the sermons he delivered during his recent visit to our country, giving the volume the title of the first sermon, *The Ladder of Christ* (Pilgrim Press, $1.25). His mystical fervor and passion for truth are everywhere apparent.

Few of the women who have sat in the seat of the mayor, in western towns, have played at one time the role of chief executive and young mother. Maria Thompson Davies has such a person as this for the heroine of her inoffensively humorous tale, *Elected Mother.* (Bobbs.)

Dr. John Clifford, England's most noted "passive resister," has been preaching for more than fifty years in a great London parish, and it is significant of the character of his ministry and of his confidence in future progress that his new volume of sermons is entitled *The Gospel of Gladness, and Its Meaning for Us.* (Scribner.)

The methods of administration, avenues of service and changes in the personnel of the workers of a large city church may be seen in detail in the illustrated semi-centennial volume containing the *History of the Parish of the Incarnation, New York City,* written by J. Newton Perkins and published through the Howard Press of Poughkeepsie by the senior warden of the church, Francis Lynde Stetson.

The difficulties in conveying to the young adequate instruction about sex matters are only equaled by the calamitous results which often follow neglect. The little volume on *Sex Education* (Duffield, $1), by Dr. Ira S. Wile, is well calculated both to remove the former and to avoid the latter. The language is untechnical and the presentation judicious.

The two latest volumes in the expository series on *The Great Texts of the Bible* (Scribner, $3 per volume) contain homiletic materials on selected passages in *St. John XIII-XXI* and *James to Jude.* The uniform excellence of these extracts, used to interpret and illustrate a wide range of Scripture, reveals not only the high standard of the editor, Dr. James Hastings, but also the wealth of first class sermonic materials produced in recent years.

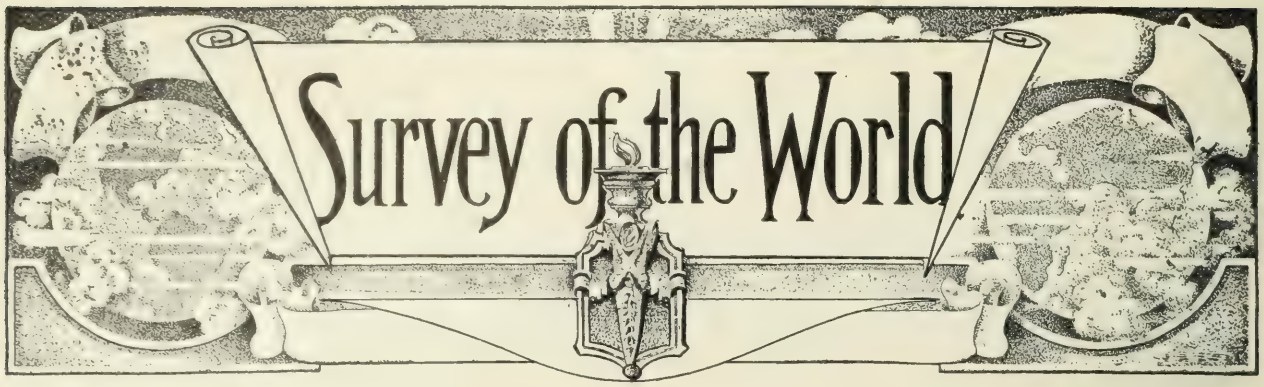
The one hundredth anniversary of the birth of *David Livingstone* (Macmillan; 50 cents) falls on March 19th of this year. Rev. C. Silvester Horne, M. P., has done well to record anew the life and labors of the great explorer, scientist and missionary. His vigorous style is well adapted to the portrayal of a life so full of activity and courageous undertaking as that of Livingstone, and the Standard Library receives a valuable addition in this interesting book.

Mr. John Bigelow late in life wrote for his inner circle of friends an interesting and characteristic account of his conversion to Swedenborgianism when in his young manhood he began to doubt the tenets of his inherited faith and question the inspiration and authority of Scripture. Just before his death he consented to have this published in the hope that it might influence others to find greater satisfaction in *The Bible That Was Lost and Found* (New Church Board; $1.) The narrative is full of enthusiasm for the New Church, of which Mr. Bigelow remained a devoted adherent until his death. The book is edited by Dr. Julian K. Smyth.

Since the Revised Version of the Bible has not been generally adopted in England, many English scholars have felt that at least the erroneous and obscure passages of the Authorized Version of the New Testament should be corrected. This sentiment has found expression in a memorial to the Archbishop of Canterbury for the appointment of a revision committee, and in the publication of *The Epistle to the Hebrews*

(Cambridge University Press, 2s. 6d.) by "Two Clerks," as a specimen of the conservative revision they hope to secure. This example is certainly worthy of high commendation.

There is a perennial fascination attached to the lives of great preachers who have in varying measure stirred and moulded the religious forces of their time. To uncover the mystery of their sway over multitudes of lives is a task that ever allures and commonly eludes the student of religious history. A worthy and interesting attempt to reveal some of the constituent elements of this almost magic power is found in Professor A. H. Currier's biographical studies of *Nine Great Preachers* (Pilgrim Press; $1.50) ranging from Chrysostom and Bernard of Clairvaux to Alexander McClaren, Beecher and Brooks.



Those who have been entertained by Edward Hutton's previous books on Italy will welcome his new volume on *The Cities of Lombardy* (Macmillan, $2), which in both text and illustrations reproduces the delight and charm experienced by every receptive traveler who visits the lakes, valleys and mountain slopes of ancient Cisalpine Gaul. Art, history and natural scenery furnish most pliant materials for expressing the genius and beauty of this attractive section of Italy. The illustrations in color, by Maxwell Armfield, are not only in harmony with the literary flavor of the text, but also suggest in their subdued tones the illusive spell of the country itself.

From scraps of direct and indirect evidence that he has collected, Prof. Adolf Harnack concludes that private *Bible Reading in the Early Church* (Putnam), was common and unrestricted. The establishment of this fact, Dr. Harnack contends, not only destroys the groundwork of the Catholic view, that the organized church has always administered the Bible as a trust, but also proves that the religion of the early church was in no true sense a mystery-religion, to whatever extent it may have become such in its accessories. The church first dealt with the regulations of private Bible reading in the second millenium and the Reformation, judged by the standard of antiquity, finds justification in its restoration of the Bible to the people.

Is it not time that someone uncovered the pitfalls that await the unwary in their pursuit of this return-to-nature cult? In *The Journal of a Country Woman*, by Emma Winner Rogers (Eaton & Main, $1.25), we again have a study of how to be happy in the country house which the city income supports. It is a pleasant record of a city woman who makes the old family homestead, whence its inmates had gone forth, as Bunty's brother puts it, to see "life" again, the dwelling place of rest and the retreat after city winters. As well as the record of health and joy her own family gained, there is a pleasant spirit of neighborliness, an effort to build up native industries and revive the fast disappearing household crafts. But, Mrs. Rogers glosses over disappointments and failures and has little of helpful suggestion.

In *Creature Songs* Louise Ayres Garnett has written a clever collection of songs for children. By this is meant that she has written songs the words of which are of great interest, and the music of the kind which appeals directly to children, when sung to them. In this series the author and composer has presented the distinctive characteristics of the more familiar animals, in songs to be sung by the child's mother. There is but one fault to be noted about this work: only one mother or sister out of a hundred will be able to sing it. The songs have a compass from low B flat to high F, or one octave and a half, whereas the average voice can only be expected to reach from low D to high E flat or E natural. It is this one fault which is likely to mar the success of an otherwise well-nigh perfect work. The songs are very cleverly illustrated by Peter Newell (New York: Oliver Ditson, $1.25).

What to Read on Business (New York: Business Book Bureau) is a bibliography of recent publications on business topics arranged in three main groups. Group one covers such subjects as the principles of business, efficient management, advertising and selling, and includes a list of reference books. Group two covers books on finance, credit, foreign exchange, insurance, etc. Group three covers topics related to accounting, bookkeeping, auditing, and cost-keeping. This is the first attempt that has been made to bring together a list of books in a field of book-making which is relatively new. The introductory statement in the book, written by George B. Hotchkiss, of New York University, declares that not five per cent of the books mentioned in the list were in existence at the beginning of the twentieth century. There are several hundred titles in the bibliography, and the book contains an index by titles and by authors. It makes a useful guide to a new field of "literature."

Plain Living Twenty-six Minutes from Broadway

Last week we spent six dollars and forty cents for food, oil and wood. That included the two dollars for Saturday and Sunday supplies. Two of us were at home that week. On Saturday two more came and on Sunday a guest. Our dining table that day was very brave with a pretty centerpiece and a vase of roses. Before the host sat a smoking dish of creamed codfish garnished with parsley. At one side were nice sweet baked potatoes; at the other side boiled white ones. At each plate was a dish of red kidney beans fresh from a fifteen cent can. On the table were celery and bread and butter—plenty of it. For dessert were rich baked apples with whipped cream and one half pound of pound cake on a dainty napkin. Everyone looked happy and physically fit: and that was an unusually sumptuous dinner.

When it was cleared away we talked of business and of what we had read; of men who had lectured and of political issues. We got out the guitar and sang; and while we were singing bits of the music great men had made we each dreamed dreams; and they were the dreams we could not lightly tell each other.

All this is to remind the "high cost of living" people that there must be millions of homes like ours where, in spite of the high cost, boys are growing up into men, where there exists fine health and aspirations, and where one can find fun and real comfort and happiness.

Since the world began for two of us there have never been more than twelve dollars a week for the running expenses of the home; and often, oh, very often, there have been much less. In the last few years the rent has been paid by one boy, who has done that for his board; and last year that same boy bought the coal, which in the longest season does not amount to more than four tons. We get into debt a little, but not alarmingly so; and out of that twelve dollars we pay the laundress and laundry bills, the ice, gas, woman who works by the hour, and we buy the toilet supplies and stationery and the thousand and one things that a house and family need, beside, of course, the food. Oh, believe me, twelve dollars a week is a fortune—if you get it right along.

The boys have earned their own clothing for years—since they were twelve perhaps; and the mother—well, she somehow keeps clothed and is just mother. The father goes without, too. Of course, there are no theater tickets, no concerts, rarely a lecture, no delightful trips to wonderful restaurants, or tea rooms, no evenings with jolly crowds, no entertaining at home, no social calls, no church or church work and not often a street car ride. Perhaps six times a year a friend sits at our table. You could count the calls made upon us within the year upon the fingers of one hand. Starved mentally and physically? No, we are not. We have books, and we want to do things and be things. One boy is earning his way in one of our three largest universities and is carrying all the subjects the university law will allow. He is big and handsome and as true as steel. One boy is finding the news that you must have served with your coffee every morning. He works all day for his company and all night for himself, and already has added to his bank account by thinking things out with his pen. The mother—is she not trying to tell you how all these things were done? The father, with the blue blood spelled in face and hands and bearing, plods and plods and keeps everlastingly at it like other men who are doing the world's work.

Back of all this are the books and the reading lamp and the evenings at home. Do you know the pleasant bustle of arranging the chair for mother? Of turning the lamp just so? Of getting out the old traveling rug for the six foot fellow on the floor? Of heaping up the cushions for the other six footer who is luxuriating on the box seat in the corner? Even the hoary old bull dog

THE "JAMES McPHERSON"
A Government Snag Boat Clearing the Channel of the Missouri River

claims, his accustomed place. After baked beans and squash on some dolorous occasions, who would refuse to dine and wine with a certain Mr. Pickwick, for instance, with his inimitable servant Sam standing at your elbow?

The beautiful evenings at home. The music, fun, and the reading. The smell of the hot corn as it tumbles from the popper. The plates of delicious fudge and the spicy apples! Is not their fragrance like fresh air to your nostrils? We sleep with the wind blowing thru the house and sometimes with the snow or rain on our pillows. Each has his own room and we knock as we enter. Each has his own shelf of books. Each eats what he wants as nearly as he can. Each respects the other's silence. How can you know what is going on in your neighbor's brain? I wish to emphasize the blessed evenings at home and the ready laugh. They are almost all that we have had.

But we are not angels. When the routine palls; when economy gets on our nerves; when even our individualities grate upon each other, we go out in wind and weather or under the stars and we have the salt smell of the bay, and the rustle of the leaves and the lights of other homes to bring us back to our senses. Oh, let me tell you, just so long as we can say Home, with the ache for it in our hearts, we are saved. With the home as the working base we can strive toward wonderful things. We can be—what can we not be? It grips the throat and burns the eyes to think of it.

I grant that it is a dreadful thing to be able to satisfy your luxury loving senses only by getting the dust out of the corners with a knife; and by polishing up the shabby furniture till your arms ache. To satisfy your sense of beauty only by a cheap cushion cover or a splotch of fresh color here or there. To adorn your poor body, which you must love and adorn till you die, (Oh, the pity of it!) just by extra cleanliness and a poor little waist and skirt. These sad things are almost unbearable, most unbelievable. But I am certain sure millions of people are living thru them—making the best of them. Divorce, billion dollar alimony, the Great White Way, the latest in furs and suits, joy riders and deaths, the soft notes of our dearest baritone—that are like drops of brown liquor to our senses—all these are merely a part of our modern Arabian Nights' tales. But out there a little way beyond the glare of your circle of light are thousands of still places where lamps are shining and where mothers and fathers sit with their boys and girls about them, drawing them close, wishing big things for them, seeing life as it really is.

RACHEL DAVENPORT.

Snags

Why the government's Missouri River snag-boats should have such tremendous

strength and almost as great a variety of mechanical equipment as a battleship is more easily understood after discovering what is included in the Missouri definition of a "snag." It is not a sharp-pointed twig that rips holes in the side of a canvas duck-boat—what the government officially recognizes as a snag is a piece of driftwood of the type shown in the accompanying photograph. This particular snag was obstructing the channel in a bend a few miles below Kansas City, its roots fast in the river bed, its sharp limbs pointing (according to snag custom) downstream. A steamer plowing its way up-river might have smashed into its projecting arms and gone quickly to the bottom—soon afterward to be buried in mud like scores of other wrecks.

One of the three snag-boats that the government keeps on duty between Kansas City and St. Louis discovered the big snag in time, sawed off its limbs and roots to make it a little easier to handle, and then with the strength of two derricks cast it on shore. The "Missouri," a fine type of the modern snag-boat, has thirty-two engines, a complete electrical plant and a floating machine shop. Two large derricks can lift most of the ordinary snags. A butting beam sometimes is used in dislodging a snag from the bottom so that ropes or chains may be fastened to it more securely. A steam saw is useful in slicing some of the largest stumps into sections which can be more easily lifted. The final resource that never is known to fail is the "Samson." It is a gigantic spool and chain in which the links are 2½-inch steel bars.

Flower Preservation

Those who have felt dissatisfaction with the results obtained from pressing flowers between the leaves of a book will be interested to learn of a treatment originating in Germany whereby many kinds of flowers may be dried so as to retain their natural form and color and be preserved indefinitely. A writer in *American Homes & Gardens* tells us that the flowers should be gathered as soon as the blossom has fully opened. They must then be dried by suspending from the stems head down for a few hours in a warm room. A large box of wood or tin should be made ready and enough silver sand to fill it procured. The sand must be washed a dozen times or so in pure water so as thereby to cleanse it and then heated in an oven until it is as hot as one can bear to handle it.

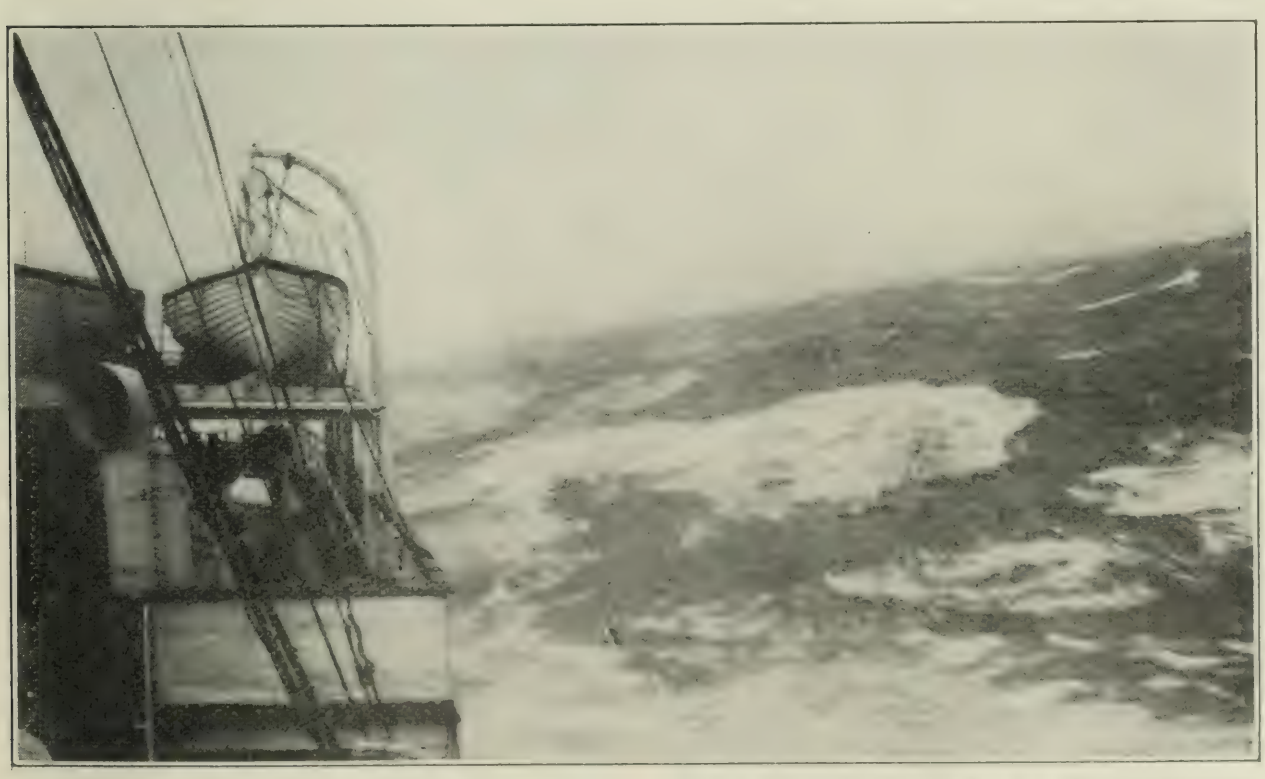
In the meantime a piece of heavy cardboard should be obtained that will fit into the bottom of the box. Thru the bottom of the cardboard insert as many long and strong steel pins as there are flowers to be preserved. On these pins impale the stalks of the flowers so that the flowers stand upright above the cardboard in their natural position. Now take the warmed sand in a pitcher or paper bag and gently let it trickle

A BIG SNAG FROM THE MISSOURI

into the box, but taking care that it spreads evenly so that all the flowers may keep their vertical position.

When the sand reaches the level of the heads of the flowers the delicate part of the operation arrives. Now the petals must be arranged in perfect order or else later the flower will come out crumpled. When the flowers are entirely buried in the sand the box should be completely covered to retain as much heat as possible and left in a dry cupboard for at least two days. If the box contains little sand and the heat has mostly escaped, the box on the second day may be put in a moderately heated oven and reheated, but no great amount of warmth is advisable.

At last the time will come when the sand can be poured off. This must be done with extreme gentleness, as the flowers by this time are in a highly brittle condition. After the sand has been removed, the flowers can be taken from their steel pins. They will then be found to be almost as beautiful and as natural as in life and will be ready for permanent preservation.



Flowers preserved in this way lend themselves especially for house decoration, but care should be taken not to expose them to the sun light as they are then likely to fade.

Tho sprigs with leaves attached may be dried and preserved in the same way, it is found that the intensity of green somewhat fades in the operation. But even so, carefully preserved foliage will be found greatly to embellish the dried flowers in decorating the home.

The Hight of Waves

Almost as old as the sea itself is the discussion about the size of waves. Some of the recently published investigations of an English scientist, Vaughn Cornish, are calculated to diminish the heat of this controversy, but may, of course, only add fuel to it. He is convinced that ship-news reporters mis-state the facts in declaring that boats often encounter waves 80 or 90 or, at times, even 100 feet high. "This hight," he points out, "invariably relates to the altitude above the flotation line of the superstructures which have been deluged with water. This is not, properly speaking, the hight of a wave, but merely the hight to which a body of water is thrown when a wave breaks on board. This increases with the speed of the ship, which dips her bows into the rising billow in a head sea."

Dr. Cornish apparently has no disposition to doubt that in storms of "exceptional duration as well as of more than ordinary severity, such as are not encountered every year," observers have seen waves that surpassed forty-five feet and may have been fifty. But "concordant observations," he writes, "indicate that anywhere in the North Atlantic with sea-room of from 600 up to

WAVES PHOTOGRAPHED DURING A NORTH ATLANTIC GALE

certainly 1000 and perhaps 2000 miles the hight of the waves during ordinarily strong gales is practically constant, being not less than forty-three feet."

Without being able to testify from personal experience to the occurrence of "watery peaks" that are on record are vastly higher, he adds: "With regard to the hight which is momentarily attained by peaks of water shooting upwards where waves cross, the late Lord Kelvin informed me that he had measured one sixty feet high, and this measurement confirms the concordant guesses of several officers on North Atlantic liners whom I have consulted on the subject."

On the matter of the length of waves, Dr. Cornish testifies that he has never seen one that appeared to be more than 400 feet. The waves of the Pacific, he believes, are no higher and no longer than those in the Atlantic.

His information concerning Lake Superior—where waves supposedly run higher than in any other of the chain of Great Lakes—is that in "unusually severe storms" such as are met with at intervals of several years, waves may be encountered, in deep water, that have a hight of twenty to twenty-five feet and a length of 275 to 325 feet.

Morocco Under French Rule

Now that France has established her authority in Morocco, and there are no frequent military incidents to report, the American press is silent as to what is happening in the protectorate, yet the real history of the French in Morocco is only just beginning; the record, that is, of a backward nation under the influence of one of the most highly civilized. If one may accept the view of the Paris *Temps*, the Residence-General is applying itself to the development of the country economically, socially and politically, while respecting, so far as practicable, local laws and customs.

Before the establishment of the protectorate dispensaries had been opened in towns where French consulates existed, as also in the centers of the Shawia. These are being systematized, and a mobile service has been added, besides secondary dispensaries wherever there are military posts. Already this hospital system has checked the pest—which broke out among the Doukkalas, and again at Casablanca. Moreover the country is being provided with better educational facilities, especially at Casablanca, where, in October, there were only 400 students in the French schools.

The Moors are endowed with the commercial instinct more highly than with some others, and the influx of a large number of Europeans, soldiers and others, has presented an opportunity to which the natives are not blind. Public works of various kinds are in progress; Casablanca's port facilities have already been improved; roads and railways are under construction. These are the triumphs of peace.

The Democratic King of Spain

The young King of Spain is not planning to visit America, as some newspapers recently reported, but we doubt not that he would enjoy the voyage. Alfonso XIII would admire some of our American qualities, and would find it easy to accommodate himself to our society. He is, indeed, a highly adaptable young man: and nothing reflects his likeness to other pleasure-lovers of all ages than the fact that he spends much of his time "incognito" in Paris. There he escapes some of the Boredom of Being a King (not a bad subject for musical comedy or Mr. Shaw).

Alfonso's democratic leanings were shown in an uncommon way some weeks ago when he called to the Palace at Madrid Senor Azcarate, leader of the Republican-Socialist Union, and talked with him there for an hour, not only about the newly organized Institute of Social Reforms presided over by Senor Azcarate, but of the general political situation. According to the political editor of the Paris *Temps*, who is usually accurate in discussions of this kind, the King told the Republican leader that he held his constitutional powers to be identical with those of a republican president; that he should in future consult the leaders of the anti-dynastic parties as well as the monarchists; that he would not oppose such liberal policies as religious toleration, educational and electoral reforms, and the establishment of old age pensions. The young King and the Socialist found themselves one upon the need of closer relations between Spain and the Latin-American republics.

The rumor of the trip to the United States seems to have found its starting-point in Alfonso's remark that he should even like to cross the Atlantic, as his aunt the Infanta Isabella did when Argentina celebrated its centenary of independence. As to Morocco, he confessed that responsibilities there had made the military burden upon Spain relatively too heavy for her European position and prosperity. Senor Azcarate left the royal palace "as republi-

can as when he went in," but more sympathetic than before in his feeling for his tactful monarch.

Alfonso will, it is said, discuss governmental problems with other leaders of the Opposition: Senors Lerron, Iglesias, etc. Some students of European politics suggest that the rallying of moderate Republicans to the royal standard is now to be looked for, and the fusion of royalist extremists and Carlists as an Opposition. This is, perhaps, too far-reaching a deduction. But the frivolous King of Spain seems to be a Spaniard before he is a King—a citizen as well as a figure-head.

Hearing in Halls

A member of the Franch Academy of Medicine, Dr. Castex, has reported to that learned organization upon his researches into acoustics. He recalls that this science was not unknown to Greek and Roman architects; he points to their successful solution of its problems in the case of the Theater of Dionysos at Athens and in that of Taormina in Sicily. Vitruvius informs us that the ancients placed vases of clay or earthenware in the walls of their auditoriums and that these vessels reinforced the voices of actors or orators.

After studying a great number of public halls, Dr. Castex reports that the chief obstacles to be overcome are deadness *(surdité)*, resonance and echoes. The materials used in construction tend to produce or counteract these faults. Marble, woodwork and glass are resonant materials; draperies are absorbent; stone and plaster, neutral. As buildings grow old and dry out they tend to improve acoustically.

Among auditoriums remarkable for their acoustics are the ancient Roman theater of Orange, in southern France (it is still in use); la Scala, the Milanese opera house; San Carlo, Naples; the theater of the Paris Conservatory. Among churches celebrated acoustically are Saint Peter's at Rome and the cathedral of Bourges. In general, it is oblong rooms, without cupolas, deep boxes, or highly ornate decoration, that most favor sound. But even in the best auditorium there are seats from which one hears speech or music better than anywhere else, while "dead spots" are not unknown in some theaters: points from which it is difficult to follow the clearest diction. And some halls are much better for orators than for musicians, while in others it is just the other way round.

The Heredity of Hair Color

When examined under the microscope human hair discloses two kinds of pigment, and only two, a reddish yellow and a sepia brown. These two colors are independent factors in heredity and may occur separately or in combination. The yellow seems to be a diffuse pigment, but the brown occurs in granules or specks. The size and number of the granules, as well as the intensity of the pigment, vary in differently colored hair. The intensity of the yellow pigment also varies so as to form different shades of red, while a combination of red with brown gives some of the more sober shades of red hair. When the brown pigment is intense it forms black, and if red be present in such cases it is completely covered.

Red hair is best seen when brown is absent, and when two bright, red-haired people marry all their children will have red hair, for there will be no brown pigment to cover it over. On the other hand, when a black or very dark brown-haired person of unmixed origin marries another with red hair, none of the children will have red hair, but if the dark-haired parent in such a union has red hair in his ancestry, then half of the children will have red hair. When there is red hair in the immediate ancestry of both parents, altho both may have dark hair, then a few of the children—three-sixteenths in the long run—will have red hair.

In the blond-to-black series we find that the intensity of the hair color in the offspring does not exceed that of the darker parent. Thus two blond-haired parents have only blond-haired children. The parents cannot transmit what they themselves lack. When one parent has flaxen hair and the other light brown, then 50 per cent of the children will have hair of a light brown shade. When one parent has dark brown or black hair and the other light brown then about half of the children will have dark and half light brown hair, that is to say, half in a population of some size. In a family of only two children it would be possible to have one dark and one light-haired child, but this would be a very rare chance indeed. The collection and interpretation of statistics of hair color are complicated by the fact that the hair of the young is frequently much lighter than in adult life, while the hair of the adult, when mixed with gray, is not infrequently reported as of a lighter shade than it really possesses.

GERTRUDE C. DAVENPORT.

THE PROPOSED NORTH RIVER BRIDGE
This bridge, as planned, will have a total length of 7,340 feet, including anchorages, with a single span of 3,100 feet, over the Hudson River.

The Hudson River Bridge

The North River Bridge to connect New York City and the Jersey shore was conceived and demonstrated feasible from an engineering standpoint some twenty years ago by Hon. Gustav Lindenthal, formerly Bridge Commissioner, and now building the world's greatest railroad bridge, the Hell Gate Arch Bridge.

The great cost including terminals of something like 100 million dollars has always been the deterrent factor, but now the growth of the city's traffic and the demand for more economical and efficient freight handling and use of dockage facilities has reached such a point that Mr. Lindenthal's project has become financially possible.

The matter is now up before Congress for an extension of charter. As soon as the desired extension is obtained the combination of the railroads, public service corporations and counties whose real estate by the construction of this bridge will jump from farm land to city lot prices, has progressed sufficiently far to insure its construction.

The bridge will cross the Hudson River in one great span twice the length of the Brooklyn bridge and at a height to permit the largest vessels to pass beneath. There will be tracks for through passenger traffic, for suburban passenger traffic, for through freight and for local freight, as well as for surface and elevated railroads. A promenade will be one of its features and ample roadway for the use of trucks and automobiles. The automobile traffic alone will be one of the most noted, though not financially important, factors of the bridge, as the thousands of car owners who are practically deprived of the pleasures of Jersey roads.

A Live School Under the Live Oaks

The influence of climate on architecture is nowhere better illustrated in this country than by the old California missions. Built by men used to sister climes of sunshine, they fit into their Southern setting as deftly as tho the handiwork of some great Cellini. Low-browed, majestic with the simplicity of strength, and mellow with sunshine, such structures as the old church of San Juan Captistrano or the mission at Santa Barbara, relieved against the soft slopes of the Sierra Madre Mountains and shaded with live oaks, furnish the richest architectural heritage that the country possesses. It is curious to note that the very best practical fact of the absence of snow is what allows these buildings, like those in Southern Spain, to nestle so gracefully close to the ground, as tho they had grown there. They do not need to be stilted up above thaw.

In designing the group of new buildings for Throop Institute at Pasadena, the architects have invested this legacy of Spanish art in the interests of education with rare skill. The cold Gothic form would be as much out of place here as an Eskimo. Low-browed long structures with neutral, red-tiled roofs, connected by means of long spans of airy sunlit arcade, and ornamented with a central crown of Spanish Renaissance—the Administration Building shown in the picture—this is the sort of inspiration that stamps an architect as an artist.

It is an old form applied to modern construction. All the material is heavily reinforced concrete, costing about 25 cents a cubic foot, of which there are 800,000 in the central building here shown. The aim has been to link utility with beauty. For example, a dome was necessary to lift this central coronet above its surrounding setting of plain mission structures, but the dome is justified by its employment as a reference library, the library application having been suggested by the Radcliffe Camera at Oxford. The campus gets immediate "atmosphere" from forty great live oaks, among which the buildings are all to be grouped without the destruction of a tree.

The Institute sets applied sciences at the center of its curriculum, but surrounds these with a border of essential humanities. Architecturally, this emphasis is expressed by Alexander Stirling Calden's heroic figures of the Humanities, grouped with Energy and Science over the archways of the main building. But the Institute thinks that some cultural studies are most practical and needful. It believes that the English language is the chief tool in the engineer's kit; and requires four years' study of it, instead of the one-year requirement of most engineering courses elsewhere. It believes that the young engineer must also know at least one continental language, besides American history and civics and business law. It believes that his first object should be serviceable citizenship, and that in this direction he has an unusual chance—as a civic engineer, if you please. It has no electives, but many "prescriptives," appointed according to individual talents or needs. It has one instructor for every group of three students, and gives much attention to research. It requires fifteen units for admission and four years of hard work for graduation. It is not a place for boys to play, but for men to work in. Half of the students earn their own way, largely thru a co-operative arrangement with the city of Pasadena, where they are employed during certain hours in the public works, such as lighting. Their wage is based on efficiency; it is neither more nor less than they earn. The best of them are rewarded with travel scholarships, for Throop believes in the educative value of travel, sending its brightest men to "the East" and to Europe every summer.

What Congress Is Doing

The Senate has passed by a vote of 47 to 23 (one more than the required two-thirds) a resolution submitting to the States a Constitutional amendment making the Presidential term six years and forbidding the re-election of a President. Passage of it in the House is expected. Approval by three-fourths of the States would exclude Mr. Roosevelt, Mr. Taft and Mr. Wilson. If ratified before the end of Mr. Wilson's term of four years it would add two years to his term. During the three days' debate it appeared to be the opinion of Mr. Roose-

A LIVE COLLEGE UNDER A LIVE OAK
The new Administration Building of the Throop Polytechnic Institute at Pasadena, California.

velt's friends that the resolution was aimed at him. For it 28 Democrats and 19 Republicans voted; in the negative were 19 Republicans, 3 Progressives and 1 Democrat. In the course of the proceedings 10 Senators voted for Mr. Bristow's amendment permitting the recall of a President at any biennial Congressional election. A resolution for an amendment providing for the nomination of Presidential candidates at primaries and for direct election by the people was lost by a vote of 32 to 35.

Tariff hearings before the Ways and Means Committee have come to an end. A Democratic caucus will decide whether revision shall be undertaken by separate schedules or in one comprehensive bill. Only one more State is needed for final ratification of the income tax amendment, and this State will be obtained within a short time. Expecting ratification, the Democrats will prepare a bill for an income tax, to yield about $100,000,000 of annual revenue.

Senators Tillman, of South Carolina; Fall, of New Mexico, and Warren, of Wyoming, have been re-elected. Other elections last week were as follows: William Hughes, Democrat, in New Jersey; W. P. Thompson, Democrat, Kansas; Morris Sheppard, Democrat, Texas; Key Pittman, Democrat, Nevada; Willard Saulsbury, Democrat, Delaware. The Democratic party will surely have a majority of one in the new Senate and this majority may be increased to two or three.

Pebbles

Stude—Don't you ever sweep under the carpet?

Janitor—Yassuh; I always sweeps everything under the carpet.—*Yale Record.*

"What has become of Miss Snooks? She was going in for theosophy when I saw her last."

"She married a restaurant man and is studying dishpantheism."—*Judge.*

Johnnie—I wish I could be Tommy Jones.

Mother—Why? You are stronger than he is, you have a better home, more toys, and more pocket money.

Johnnie—Yes, I know; but he can wiggle his ears.—*Milwaukee Sentinel.*

Binks—I certainly admire the inventor of the steam engine.

Jinks—Man of iron constitution, eh?

Binks—No; man of great engineuity, see?

Jinks—Watt's his name?—*Princeton Tiger.*

One Day More.—She—But will you love me in cold December as you do in balmy June?

He—More, darling!

She—More?

He—Sure! There's one more day in December.—*Pelican.*

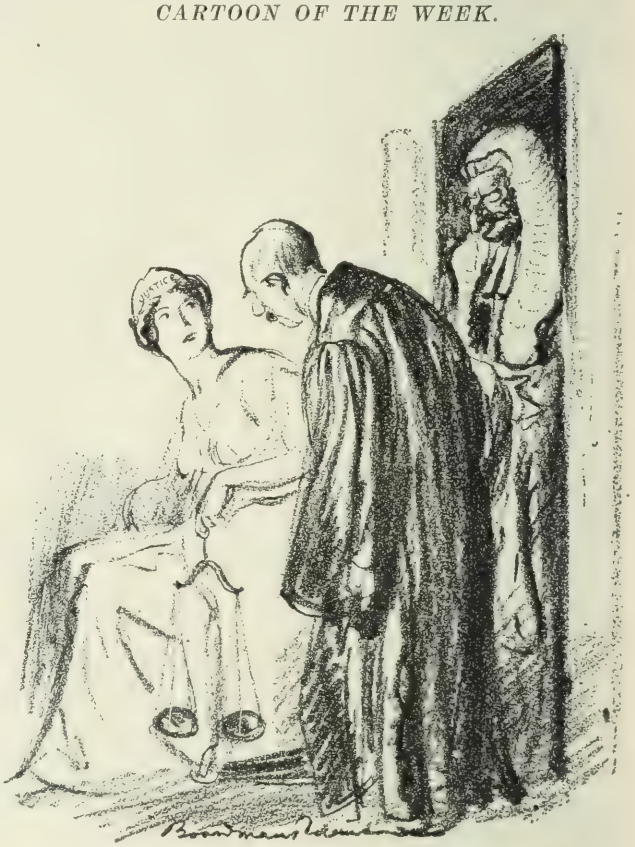
The difference between (1) a gardener, (2) a billiard player, (3) a gentleman and (4) a exton, is: the first minds his peas; the second minds his cues; the third minds his p's and q's, and the fourth minds his keys and pews. Now, Reginald Von Hotenberg, strike if you dare!—*Punch Bowl.*

"Casey," said Pat, "how do yez tell th' age of a tu-u-rkey?"

"Oi can always tell by the teeth," said Casey.

"By the teeth!" exclaimed Pat. "But a tu-u-rkey has no teeth."

"No," admitted Casey, "but Oi have."—*London Opinion.*



Lecturer—All statistics prove that the blonde woman is more difficult to get along with than the brunette.

Astonished Man in the Audience (starting up)—Are you certain of that fact?

Lecturer—It is a fact.

Astonished Man—Then I believe my wife's black hair is dyed.—*London Opinion.*

JUDGE: "Madam, I shall have to ask you to step aside. Here is that venerable man Mr. Justice Precedent."—(Boardman Robinson in the New York *Tribune.*)

In the Realm of Insurance

By W. E. Underwood

The Standard Fire Insurance Policy

In a message to the New York Legislature, commending to the consideration of that body a proposal to amend the standard fire insurance policy, Governor Sulzer observes: "The provisions of the policy should be made so simple, so short, and so clear that the rights of both are apparent, and the interests of both are safeguarded." This is true of every document which attempts to define the duties, privileges and responsibilities of two or more parties to any undertaking. The court records are monumental evidence of the failure, in some particular, of the best of these efforts. It will be recalled that the will of a man of affairs so experienced, a lawyer so learned and a writer so skilful as was Samuel J. Tilden, was not incontestable. Simplicity, brevity and clarity are prime virtues in any legal instrument, and if the standard fire insurance policy can be heightened in these attributes without abridging its general effectiveness, the improvement should be made.

But when Governor Sulzer asserts, as he does, that the present standard policy "is filled with perils to the innocent," he indicates a condition that does not exist. To find room for the simplification of the contract, it is not necessary to endow it with defects which it does not contain. To say that it embodies "a mass of technical conditions and provisions that the people find most difficult to understand," is to describe almost any instrument of equal length and of ultifarious covenants, exprest in the somewhat ancient tautological phraseology peculiar to the legal profession. As a matter of fact, in that particular, the standard policy is, by comparison, exceptionally modern. Very few compositions which remain unread are understood by those who own them; and the neglect of insured persons to read the contracts they have entered into with their insurers, is notorious.

If the New York form is in need of revision that fact should be ascertained by a properly constituted commission after careful investigation. It is a kind of work which prospers best when haste is made slowly. The need for changes must be well demonstrated and the method of making them must be scrupulously weighed.

Choosing a Life Company

The editor of this department is constantly in receipt of letters from various parts of the country asking if the inquirers should take insurance in certain life insurance companies which they name. Most of the companies indicated are of comparatively recent organization, small as to number of members and volume of insurance outstanding and, altho entirely solvent, have yet to prove themselves.

New companies should expect to win their way, securing first the confidence and patronage of the people immediately around them, and slowly extending their fields of operation as they grow in bulk and strength.

Financial solvency is not the only requisite. Character is—well, we think character is about nine-tenths of the whole. Men and women can afford, perhaps, to take chances in purchasing almost any commodity of use, and escape serious injury if the experiment turns out unfavorably; but they play with fire when they gamble on the quality of their life insurance. The best is none too good. Why ask advice as to the desirability of compartively unknown companies? Doesn't the question imply a doubt in the inquirer's mind?

It is time which proves a life insurance company. Some there are which are quite mature that are negligible—like Tomlinson, neither good nor bad, and fitting in nowhere. There are others of the same age, the achievements of which are a glory to the human race. They have striven to be useful, they have character and individuality. To the person who can afford to carry only a limited amount of life insurance, it is of those in the last named class he should choose. "Make assurance doubly sure and take a bond of Fate."

Amzi Dodd

Judge Amzi Dodd, eminent in law, mathematics and life underwriting, died January 22 last, at the little village of Bloomfield, N. J., where he was born nearly ninety years ago. Judge Dodd attained distinction in the three callings to which he devoted himself. He filled the offices of Vice-Chancellor and Justice of the Court of Errors and Appeals; and he served, first as mathe-

matician, then later as president of the Mutual Benefit Life Insurance Company. His contributions to the cause of mutual life insurance are of extraordinary value. He formulated and put into practicable operation the system of automatic extension thru which the cash equities in policies, in the event of lapse, were applied as premiums to keep such policies in force for their full face amount for such length of time as the fund would purchase. Thru this system thousands of beneficiaries who were unaware of the existence of any insurance due them, have received unexpected and much needed assistance. Judge Amzi Dodd also formulated the principle that all members of a mutual life insurance company were equally entitled to the benefits of every advance, every improvement made; and as new benefits became practicable, he made them retroactive in their application, regardless of the limitations and restrictions contained in contracts issued prior to their adoption. In 1902 Judge Dodd retired from active service but retained his seat as a trustee.

The Aetna Life

The agency force of the Aetna Life Insurance Company of Hartford did some active and effective work during the year 1912, for it placed on the company's books the sum of $53,204,479 of new insurance, carrying the total in force to nearly 335 millions, and making a net gain in that respect of $16,321,722. Large gains mark every department of the company's business, which includes, in addition to life insurance, personal, accident, health, liability in its various forms, automobile, burglary, plate glass, etc. The premiums for the year were $18,150,699, a gain over 1911 of $978,-815; the entire income was $23,950,359; a gain of $1,955,663; and the total assets at December 31 were $110,523,775, a gain of $5,768,240. The Aetna carries liberal reserve funds for the security of its several departments. Its life policy reserve is valued at $86,942,660; its combined accident, health and liability reserve is calculated at $2,629,-241; its liability claim reserve is $2,440,-392; in addition to which it maintains a special reserve of $760,106 for contingencies. The balance sheet at the end of the year, including liberal allowances for all purposes, shows total liabilities of $98,601,-043, leaving a surplus for the security of policyholders of $11,922,732. In its publisht statement the company calls attention to the fact that the amortized value of its bonds as provided by the law of New York shows a value greater than the market value it uses in making up the account by $1,400,686. This, under New York Department valuation, would increase the assets and surplus nearly a million and a half.

The Springfield F. & M.

The year 1912, its sixty-fourth, was a prosperous one with the Springfield F. & M. Insurance Company of Springfield, Mass., as its recorded gains in premium and total income, assets and surplus indicate. The balance sheet as December 31 shows total assets, $11,056,692, an increase of $648,845; unearned premium reserve, $5,001,291; total liabilities, $7,790,639; and surplus to policyholders, $5,266,054, a gain in the last item of $395,346. The company's premium income for the year reached the handsome total of $5,456,731, which was larger than that of 1911 by $212,102. A glance at the list of securities in which the Springfield's assets are invested, indicates the care and judgment exercised by President Damon in directing the company's financial policy. We find State, county and municipal bonds, $392,730; railroad bonds, $271,750; miscellaneous bonds, $139,000; railroad stocks, $3,278,800; bank stocks, $2,003,516; miscellaneous stocks, $1,245,000; mortgages on real estate, $1,716,370; real estate owned, $300,000; cash on hand and in course of transmission, $1,656,887.

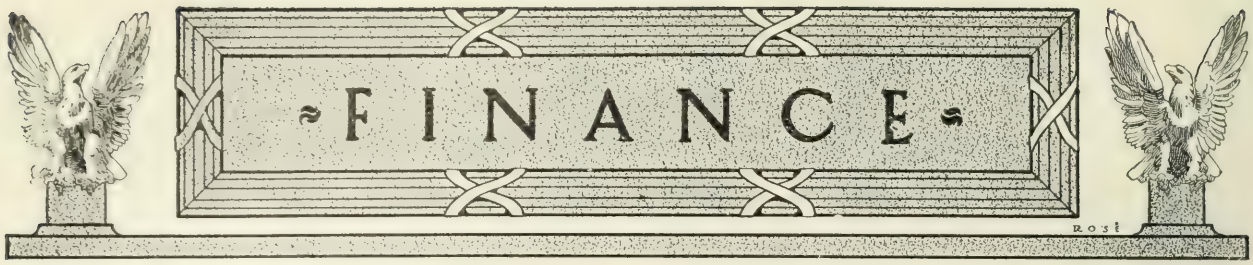
Penn Mutual Life

The sixty-fifth annual exhibit of the Penn Mutual Life Insurance Company of Philadelphia is a record of substantial progress in every department of the company's business. The total assets at the end of 1912 were $134,375,486, a gain for the year or $7,892,335; the policy reserves advanced $8,192,475, to a total of $115,572,722; premium income aggregating $20,876,369, shows an increase of $1,239,874; while the gain in gross income, was $1,720,056—totaling at $27,657,843. The sum of all the payments made to policyholders was $14,-838,658, which was $2,158,294 more than for the preceding year. The company's agency work last year was eminently successful with 22,728 policies insuring $76,-986,181 of new paid-for business, a gain over the preceding year of $3,851,880 of insurance; and the outstanding insurance at 209,306 policies for $564,977,398, register an increase in that item of $32,427,301. The total payments to policy holders since organization is $162,354,483.

The Virginia Fire and Marine

The annual financial statement of the Virginia Fire and Marine Insurance Company of Richmond, Va., was the eighty-first of that sterling old Southern company. It shows total assets of $1,641,608, a large proportion of which is invested in stock and bond securities of a high order. The Virginia F. & M. is a conservative fire underwriter, and while its yearly gains are always substantial they are not, in a comparative sense, large. The gain in assets was $30,520, while the unearned premium reserve increased but $18,190, indicating a proportionately small increase in outstanding policy liability and a careful selection of risks. The net surplus at December 31 was $620,548, which, with the cash capital of $250,000, places the policy holders' surplus security at $870,548.

The Home Life



During the year 1912 the Home Life Insurance Company of New York wrote $14,315,000 new insurance, which was nearly a million and a nalf more than the total of 1911, and closed the twelvemonth with $110,647,000 in force. The total premium receipts were $4,023,298; and it paid its policyholders for death claims, matured endowments, dividends, etc., $2,937,060—the cash dividends aggregating $512,697, which was $28,000 more than the sum distributed the year before. The annual statement shows gains in assets and surplus. The total funds on January 1 were $27,767,931, a gain of $882,369; and the surplus stood at $1,917,903, a gain of $54,410. The Home carries its deferred dividends as a liability and as that fund increased $109,000 during 1912, totaling at the end of the year at $2,544,000, the surplus noted above is free and clear of all demands. In addition to these surplus gains, the company's management set aside a special reserve of $180,000 last year as a protection against unforeseen contingencies of every character. The company's mortality experience in 1912 was exceptionally favorable.

Kimmel Again to the Front

A prisoner in the Pike County jail at Bowling Green, Mo., who when arrested gave his name as Henry Thurman, believing himself to be near death a short time ago, exprest a desire to make a confession. In the course of the revelation about himself and his career, he asserted that he was one George A. Kimmel, formerly of Niles, Mich., and Arkansas City, Kan., who mysteriously disappeared from Arkansas City some ten or a dozen years ago. The real Kimmel carried a comparatively large amount of life insurance, a portion of which was paid to his beneficiaries. The New York Life had issued a policy for $25,000, but was not satisfied with the proofs of death submitted, and has since persistently contested the claim. A queer feature of the case lies in the fact that one White, an inmate of a State prison, "confessed" several years ago that he was Kimmel and, altho his identity as such was denied by the real Kimmel's mother, opinion in Niles, where the genuine man of that name was reared, was pretty well divided on the question. The man now in the Bowling Green jail is recovering from the illness he imagined was mortal and continues to stand by his confession. The county authorities who have investigated the story are convinced that he is Kimmel.

Glens Falls Insurance Company

To the student of insurance history there is something unusual and, in a way, fascinating about the origin and progress of the Glens Falls Insurance Company, the habitat of which is the miniature city of Glens Falls in mid-eastern New York. Millions of people in the United States know of the existence of the city only through the fire insurance company; and there is, perhaps, no other community of the same population which contains a financial institution of like size which in every particular measures up to the achievements supposed to be characteristic only of the world's largest trading centers. Here is a town of about fifteen thousand people which for upward of sixty years has been the home of a company of $200,000 capital that paid its stockholders in 1912 a cash dividend of $210,000 and a stock dividend of $300,000; the income of which exceeded its losses and expenses by more than $400,000; and which turned the end of the year with invested assets of $5,719,168, of which $2,485,506 was net surplus over all liabilities. Nearly fifty per cent of its assets is surplus. Viewed as an underwriting institution, the Glens Falls has no superior in the world of underwriting; as a financial institution its history is one of marvelous success.

Falling Meat Supply

The Department of Agriculture's report concerning animals on farms at the beginning of the present year is now available It shows that altho the number of horses and mules increased in 1912, the number of food animals declined, the losses having been about as follows: swine, 4,200,000; sheep, 880,000; cows, 200,000; other cattle, 1,230,000. The numbers are shown below:

	1912.	1913.
Cows	20,699,000	20,497,000
Other cattle	37,260,000	36,030,000
Sheep	52,362,000	51,482,000
Swine	65,410,000	61,178,000
Horses	20,509,000	20,567,000
Mules	4,362,000	4,386,000

While the number of food animals was less, the market value of them rose, as consumers well know. It is estimated by the Department that the values were increased in twelve months by the following additions: cows, $107,000,000, or 13 per cent; other cattle, $159,500,000, or 20 per cent; swine, $79,750,000, or 15 per cent; sheep, $21,500,000, or 12 per cent. That is to say, the value of the 36,030,000 cattle was greater by $159,500,000 than that of the 37,260,000 one year earlier. Automobiles did not prevent an increase of the number of horses, and the number of mules was larger than in any previous year.

Currency Legislation

It is said that Governor Wilson thinks currency reform is not less important than tariff revision, but no one appears to know whether currency legislation will be considered at the extra session. Mr. Underwood, it is asserted, desires that the session shall take up nothing but the tariff. More than half of the present members of the House Banking and Currency Committee will not be members of it in the new Congress. On this account there will be delay. Part of the present committee has been engaged in the Money Trust inquiry, and another part, led by Chairman Glass, has been taking the testimony of bankers as to currency reform. Legislation for the reconstruction of the banking and currency system ought not to be deferred for a year.

Steel Corporation's Earnings

The Steel Corporation's quarterly reports of net earnings indicate the condition of one of our greatest industries. Net earnings for the last quarter of 1912, it was announced last week, were $35,185,557, or almost twice as much as was earned in the year's first quarter. Following are the quarterly figures for the last three years:

	1910.	1911.	1912.
First....	$37,616,876	$23,519,203	$17,826,973
Second..	40,170,960	28,108,520	25,102,265
Third...	37,365,187	29,522,725	30,063,512
Fourth..	25,990.978	23,105,115	35,185,557
	$141,144,001	$104,255,563	$108,178,307

The upward movement thruout last year is noticeable. Earnings for the first quarter were the smallest since 1904. When the year closed, the mills were at work to the limit of their capacity, some of them were sold ahead for nearly twelve months, prices had been rising, and large premiums were being paid for prompt delivery. There was no reaction in January.

At the end of last month a wage increase of $12,000,000 a year was announced. Several independent companies have since granted a similar increase to their employees. But there has been a strike at the Corporation's wire factories in the Rankin and Braddock districts, and on the 1st inst. the Secretary of the Federation of Labor called for a general strike of the Corporation's 40,000 men in or near Pittsburg, intending to compel recognition of labor unions.

The First National Bank of St. Paul on January 1 took over the assets and assumed the liabilities of the Second National Bank, in that city, at the same time increasing its capital stock from $1,000,000 to $3,000,000, and its surplus from $1,000,000 to $2,000,000. This bank's deposits are about $18,000,000. E. H. Bailey is President and Louis W. Hill is chairman of the board. Among the directors are James J. Hill, of the Great Northern Railway Company; Howard Elliott, president of the Northern Pacific; Darius Miller, president of the Burlington, and other men prominent in the Northwestern States.

The Presidential Term

Amendments to the Constitution are not coming quite as hard as was thought. Congress is ready for another one which will make the Presidential term six years, instead of four, without reëlection. We do not approve the proposed Amendment, and for the following reasons:

Six years is too long a term. The people should be able to recall a President and his Government sooner than that. We have no machinery by which, as in Great Britain, a government can be recalled at any time if it prove unsatisfactory. Four years was chosen at first as the Presidential term because it allows time for a President to make good if he can, and yet is not long enough for him to become a burden on the country. To lengthen his term to six years would require us to apply the recall to him, which, on so large a scale, over the whole country, with its hundred millions or more of people, would be very disturbing, if not dangerous. It is better to give the people an opportunity automatically to recall the President at the end of a limited term.

Again, with the term of six years, it is proposed to make the President ineligible to a second term. Why? Simply because those who urge it fear that the President may so manipulate the government of the country that he can bamboozle the people and persuade them to reëlect him indefinitely, and become a dictator as did Diaz in Mexico. That is, they do not trust the people. That is a pretty doctrine for Progressives to entertain. It is their slogan, and that of all of us, that we can trust the people, our people. We are determined that our people shall be trustable. For that reason we insist on popular education, so that our millions of rulers may be able to rule. We believe that our people can be trusted not to reëlect a despot. If they cannot be trusted—if they are so stupid and ignorant—they had better reëlect a despot, as in Mexico, where Diaz at least gave peace and prosperity.

We do not say that it is wise in the best of countries—and there is none better than ours—to reëlect a President to a third term. The tradition of Washington is against it. Even King Arthur and his Round Table had to pass away, lest one good custom should corrupt the world. The good may be the enemy of the better. Yet the people must be trusted—and it is the good sense of the people, not a rigid provision in the Constitution, that should limit the number of terms. The people have already decided wisely, and they decided in the beginning that they should have the right to give a Chief Magistrate who does his work to their satisfaction a second term of four years; and, without giving up their liberty of choice, they have decided that a third term is not desirable; and will not be unless some extraordinary exigency should arise.

But we are told that the quadrennial recurrence of the excitement of a Presidential election is disturbing to business, that it is disagreeable, noisy, and that it is therefore better to lengthen the period to six years. This is an utterly unworthy objection. The excitement of an election is not a bad thing. It is good; it is educating. It teaches our voters, and particularly our young voters, how to vote. They learn that they have a country worth loving and working for, working for politically, worth dying for. We would not reduce the number of Presidential elections, any more than we would increase the power of an unfit President by giving him a longer term in which to play the incompetent, or, worse yet, the tyrant.

But the further objection is made to the present reëligible term of four years that it tends to an unseemly and dangerous ambition of the President to work for another term. Such an effort has been unseemly at times; but that is not necessary and the effort is more and more likely to defeat itself. Let Congress give us the law for which President Taft has pleaded, by which all but the very highest offices shall be put under a civil service law, and the President will not have an army of politicians, postmasters in every village, to work for him. We can easily remove the spoils of office. Do this and the danger is made inconsiderable. There was less of it at the last election than previously. Even as it is, the danger of thus seducing the people is a very small one, and is very greatly exaggerated by the party that seeks a change. What is more, the hope of reëlection acts as an incitement to a President to give the best of his service.

For such reasons as these we cannot approve the proposed change. If Mr. Wilson should prove an admirable President the people ought to be permitted to give him four years more of service. If he proves a bad President six years is much too long a term.

Men Who Would Be Missed

So many of our readers have responded to the request made in our issue of Jan. 30 for their opinions as to who are the most useful Americans that we must thank them collectively in this way instead of individually by letter. The lists of the ten men and women whose deaths would be the greatest loss to the country show a striking agreement in regard to certain individuals and an equally significant omission of others who might have been expected to appear. There are also indications of geographical differences; those who are most admired in some localities are unknown or less highly esteemed in others.

In several high schools the question has been put to the students for the purpose of directing their attention to the importance of a recognition of contemporary achievement. One contributor has, quite on his own responsibility, sent in a list of "the ten most harmful Americans" which curiously enough contains one name appearing on most of the other lists. We do not, however, expect to publish a list of those who, to use Barrie's phrase, are in the opinion of the contributor "better dead," for it might bring us into conflict with the libel laws. We shall be glad to receive replies up to March 1. A postal card will do as well as a letter.

For the Offices

The Democrats of the Senate continue to prevent action upon the President's nominations, more than 1500 of which are now pending. This is done with the expectation or hope that the new President will give all the offices in question to Democrats. One of those whom Mr. Taft reappointed is Edgar E. Clark, Interstate Commerce Commissioner, whose term expired on Dec. 31. He could not act after that date, and the place is vacant. Senator Martine very frankly said: "Mr. Clark is not opposed because he is not eminently qualified for the position, but because there is a Democrat in New Jersey whom we

wish to put in his place." But Woodrow Wilson is also a resident of New Jersey, where he recently refused to displace a Republican State officer (at the end of his term) because the latter's service had been excellent and he had "made good." We expect that the new President will reappoint Mr. Clark, if the place shall remain vacant until March 4. The committee report, from representatives of both parties, was in Mr. Clark's favor.

Mrs. Wickliffe, the widow of a Democratic Congressman, asks for the place now held by Miss Julia C. Lathrop, whom Mr. Taft made chief of the new Children's Bureau. The office, Mrs. Wickliffe says, ought to be held by a Democrat, and she adds that she has been a worker in the party for several years. It is well known that Miss Lathrop had exceptional qualifications, and that she is doing the work in an admirable manner. The movement in support of Mrs. Wickliffe shows, like the attitude of the Senate Democrats, that the new President may not find himself in full accord with prominent representatives of his party at the beginning of his term. We predict that Miss Lathrop will remain at the head of the Children's Bureau.

The Specter of Militarism

We thank Mr. Carnegie for his article publisht elsewhere in this issue. It should be read by every patriotic man and woman in the land; for, unless all signs fail, there is a deliberate movement now under way to plunge the country into the mad military scramble of the European nations. It will be denied, of course, that such is the intention of our militarists; but such, nevertheless, is the fact.

The Navy League is spreading broadcast a petition for a Council of National Defense, to be composed largely of military men. Everyone knows what such a council will urge.

The Army League has just been established to force the people and Congress to increase the size of the Army.

A bill has been reported favorably in the House to turn the militia into a second standing Army and to pay them out of the Federal treasury. It is not unlikely to pass.

The Secretary of the Navy is thi very week berating the House of Representatives to appropriate $40,000,000 for three new dreadnaughts altho President Taft said, at the beginning of his term, that one battleship a year would be enough after the completion of the Panama Canal.

Tho we have the third largest Navy in the world, and its efficiency will be doubled as soon as the Canal is opened, Congress is told that 25,000 troops will be needed to save the Canal from destruction by an enemy. It is even proposed to let the jungle grow up to the Canal shore as a flanking protection. A land flowing with milk and honey is not to be tolerated.

And so it goes. Yet we have not an enemy on the face of the earth, and we challenge anyone in seriousness to specify a single power that has the remotest intention of attacking us.

Should Universities Teach Theology?

Theology is a branch of philosophy. It is not the same as religion, altho religion is related to theology, and so to philosophy. The Universities must, of course, teach philosophy: must they omit that section of philosophy which treats of Theology and of Religion?

Let us raise a few questions by way of answer. Is the universe, as we know it, self-existent, or is it contingent? Has it universality or is it locally developed? If the latter, can it exist by any inherent necessity? If not necessarily self-existent, how came it into existence? These are questions for philosophy, but their answer may involve theology or even religion.

Is life, in plants and animals, the unconscious movements within their structure by which they grow, a mechanistic process; and are the processes of evolution dependent on

life, from the lowest to the highest forms, also chemically mechanistic; or has a new vital power entered in which cannot be explained by the laws of chemistry; and if so, how did it get in? Was it by some exterior force applied to it and directing it? These are questions of philosophy and have a bearing on theism and religion.

Or is there a special subconscious consciousness and will in matter in its ultimate constitution, in its molecules, atoms and electrons? If there is such a super- or hyper-consciousness, as some teachers of creative evolution claim, is such evolution competent to create an oak, an eagle, a man, with no outer guidance? These are questions of philosophy quite as much as of science, and, "as every schoolboy knows," have a bearing on theism and religion.

And, again, when we find such amazing instinct in bees and birds and fishes, and the higher flight of reason in man, can we hold that the intelligence involved is the product of physical and chemical forces alone, or of the added powers of vitalism; or is it legitimate to conceive and hold that some Supreme and Universal Power ruling over nature has guided nature to these great achievements?

Such questions as these, and many more that might be asked, belong to philosophy; but they also trend toward theology, a branch of philosophy, and have a bearing on religion, which has to do with our duty to God, if there be a God. We do not see how our universities can help teaching some theology in their teaching of philosophy, just as the teaching of history involves some teaching of religion, and the teaching of ethics involves a great deal of it. Thus we answer a question asked of us by one of our subscribers.

Artificial Atoms

More wonders than were ever produced from magician's bag or Pandora's box have come from what used to be called—quite absurdly—a "vacuum tube." Since 1895, when Professor Roentgen drew from it his x-rays, we have had a succession of surprises culminating last week in the announcement by Sir William Ramsay that the passage of electricity thru such a tube filled with hydrogen at low pressure produces neon and helium. The mystery of it is the same as puzzled King George when he saw the apple dumpling. "How got the gases in" this hermetically sealed glass bulb? Were they occluded in the aluminum cathode or the glass walls? Were they produced by the decomposition of the aluminum or of one of the elements in the glass? Were they built up out of hydrogen atoms? Or were they formed from the electricity itself? That such revolutionary hypotheses as these last can be seriously considered in the British Chemical Society shows how rapid in recent years has been the expansion of our ideas of what is possible. THE INDEPENDENT incurred some contempt when in July 26, 1906, it extended the hospitality of its pages to the French savant, Dr. Gustave le Bon, for the exposition of his theory of "The Decay of Matter" thru its gradual decomposition into radiant energy. But now we possibly have experimental evidence of the reverse process, the making of matter out of radiant energy. Tho this seems to bring us nearer to a realization of the dream of the alchemists, the transmutation of the baser metals into gold, yet it puts out of our reach the practical application of this knowledge which was, it must be confest, the chief concern of the alchemists, for Professor Ramsay points out that even if it were possible to change lead into gold the energy used up in the process would be much more valuable than the gold produced.

Many, however, will shrink from such a revolutionary hypothesis as the creation of matter from electricity and prefer to believe that the helium and neon have been produced by the combining of several atoms of hydrogen; four to make up the atom of

helium and twenty to make up the atom of neon. It will be remembered that the passage of an electric spark thru oxygen changes it into the allotropic form of ozone by the condensation of three molecules into two.

A few years ago Professor Ramsay announced that he had succeeded in converting copper into lithium by the action of the radium emanation, the most concentrated form of energy known to man. This has never been confirmed and the chemists of the world are still skeptical of the alleged discovery. Madame Curie, who repeated his experiments, could find no evidence of such a transmutation of elements, and it has been whispered about that the reason for the difference in results might lie in the fact that Professor Ramsay, unlike Madame Curie, is fond of smoking cigarets in the laboratory and tobacco ash contains lithium.

But he has the disconcerting habit of turning the tables on his incredulous contemporaries. He caused great annoyance to the chemical fraternity in 1894 by announcing and, what is worse, proving that air which had been analyzed in every chemical laboratory for a hundred years contained one per cent of a gas, argon, whose existence had not even been suspected. His latest discovery of the formation or at least the appearance of helium and neon in the x-ray bulbs is confirmed not only by his colleague, Prof. J. Norman Collie of University College but also by Professor Patterson working independently in Leeds University. Sir Joseph J. Thomson of Cambridge and Prof. Frederick Soddy of Glasgow, who are quite as eminent investigators in the field of radio-activity, deny the interpretation of Sir William Ramsay and his associates. They also have found neon and helium in x-ray bulbs but account for it by the least violent of the hypotheses advanced, believing that the gases were in the pores of the metal cathode or the glass and merely liberated, not made by the electric current.

The Course of the Labor Movement

A more vivid picture of the change that has come over the industrial world since 1860 one need not wish for than is presented in a review, by James Douglass, LL.D., of the life, work and opinions of "Sir David Dale, Iron Master, Conciliator, Arbitrator," which was publisht in May of last year in the *Engineering Magazine*. It is worth turning back to by any reader who wants to get a clear notion of the significance of those teachings and policies which we now associate with the capital letters "I. W. W."

Sir David Dale began life as plain David Dale, clerk in the office of a railroad company. He rose quickly to a secretaryship and soon after formed a partnership with the owner of a railroad repair shop. At twenty-nine years of age, when the great Derwent Iron Company failed in 1858, Mr. Dale proposed a plan of re-organization under a new name which met with favor, and which, with the ability of a master of business methods, he put into execution.

Descended from the David Dale who had aided Robert Owen to carry out his industrial reform ideas at the New Lanark mills, Mr. Dale was soon devising schemes to bring about harmonious relations between employers and wage-earners, and thereby put an end to the chronic and ever-widening strikes and lockouts which at that time were devastating the iron trade and other British industries. Conciliation and arbitration Mr. Dale believed to be the feasible means to this end. He saw that if the plan were to succeed, the manufacturers must get together and work in accord, and that the wage-earners also must act with unity, which they had the means of doing in their trade union organizations.

How such ideas were regarded in those days was plainly enough indicated in a curt minute which the North of England Iron Manufacturers' Association had adopted in

1866—in reply to a request of the iron workers—that "the matter in question is not one which is capable of being adjusted by arbitration." Nevertheless, Mr. Dale, in 1867, at the London meeting of the Associated Chamber of Commerce, offered a resolution in favor of establishing courts of conciliation for the settlement of disputes, and he followed the matter up in the face of indifference and opposition, until, in 1869, eighteen out of twenty-eight works, employing twelve thousand men and boys, and the operatives in those eighteen plants entered into an agreement whereby they were to submit their disputes to a board of arbitration. For carrying out the plan the employers formed an Iron Manufacturers' Association, and the employees an Ironworkers' Union.

Between April 20, 1869, and January 26, 1880, there were thirteen arbitrations. Among the arbitrations were Judge, afterwards, Sir Rupert Kettle, Tom Hughes, the author of "Tom Brown," Mr. J. Mundella, and Mr. Dale himself. Including conciliation efforts, in addition to the arbitrations, the Board effected the settlement of seven hundred disputes. The general result cannot better be described than in Mr. Dale's own words: "The system has secured peace and regular work." Incidentally, one of the results achieved was a general recognition thruout the British industrial world of the value of labor organizations which, in the earlier days, had been looked upon as little better than conspiracies for stirring up strife.

But now new influences began to make themselves felt, and no one watched them more keenly or sooner perceived their significance and tendency than Mr. Dale, now become Sir David Dale, Baronet. In 1899 at a meeting of the Industrial Conference of the Labor Association at Leeds, he gave expression to his forbodings. There were indications, he said, that in industries which had earliest entered upon the road of peaceful industrial arrangement and had longest followed it, a new generation of workmen had not inherited their fathers' experience of how much more may be gained by negotiation or arbitration than by strife or strike; and with clear vision Sir David associated this change with "that form of socialism, until then averted from England, which was occasioning anxiety in continental Europe."

In the twenty-two years that have followed since this address was made, the drift of the labor movement in England and in America, as well as on the Continent, has been away from any reconciliation between capitalist employers and wage-earning employees. The employees in increasing numbers have adopted the notion that, by one means or another, they should become themselves the owners and lords of industrial capital and opportunity, and should not try to find a solution of their problem in any amelioration of an order which places ownership in the hands of one social class and mere labor power in the hands of another. To some of them the plan of State or parliamentary socialism appeals, but to others it seems simpler to organize "direct action" for conducting such frank warfare upon capitalism as will compel present owners to surrender their plant to the workers.

This program, and the fundamental objection of wage-earners who stand for it to all attempts at conciliation and arbitration, was clearly set forth at the opening of the present Parliament by Mr. Ramsay McDonald, who said:

> The workers were asked to trust to Conciliation Boards and Arbitration, but their confidence in their methods had been impaired and they said: "We have been cheated so often, and we are not going to be cheated again." A minimum wage ought to be made the first charge on industry, and monopolies ought to be nationalized.

And, more pointedly, a radical labor pamphlet, issued at Cardiff, Wales, and entitled "The Miners' Next Step," says that what radical organizers have in view is:

That the old policy of identity of interest between employers and employed be abolished and a policy of open hostility be installed.

That a continual agitation be carried on in favor of increasing the minimum wage and lessening the hours of labor until we have extracted the whole of the employers' profits.

That our object be to build up an organization that will ultimately take over the mining industry and carry it on in the interest of the workers.

Beyond any doubt this is the real program of the aggressive elements in the labor movement the world over today. This is the program to which every thoughtful student of social affairs, every conscientious voter, must determine his own attitude.

Swindling by Mail

In the Postmaster General's recent annual report it is shown that more than 4000 cases involving a fraudulent use of the mails by swindling promoters were investigated last year by the Department's inspectors. More than 1000 of the rascals were arrested, and hundreds were convicted. In the last two years, the report says, these men have robbed the American people of $100,000,000.

Prosecution and punishment of such swindlers should not be due wholly to the work of the Post Office Department. They should be attacked by State or municipal authorities in the places where they have offices and from which their deceptive letters and prospectuses are sent by mail to those whom they defraud. Many of them have occupied offices in the City of New York. In a recent message to the New York Legislature Governor Sulzer said:

One of the most widespread of public grievances in connection with the purchase of stock arises from false or fraudulent prospectuses, statements, or advertisements regarding corporate securities. Under our law as it now exists it is difficult to bring to justice persons who, by means of false and fraudulent statements, advertisements and promises, deceive and wrong the investing public. These deceiving practices have been attacked under the Federal laws, forbidding the use of the mails for fraudulent purposes. I recommend amending the law of this State so as to make it a criminal offence to issue any statement, or publish any advertisement, as to the value of any stock or other security, or as to the financial condition of any corporation or company, issuing or about to issue stock or securities, where any promise or prediction contained in such statement or advertisement is known to be false or to be not fairly justified by existing conditions.

Under his direction there was introduced, last week, a bill forbidding the publication and circulation of such false or misleading statements, and providing that the penalty should be imprisonment for three years, or a fine of $5000, or both. This bill should speedily become a law. The banking institutions and financial reputation of New York suffer in the estimation of many swindled investors in distant parts of the country by reason of the criminal activity of a considerable number of the scoundrels who have robbed the people of $100,000,000 in the last two years. These institutions might profitably assist the local authorities in the work of detection and prosecution.

A Serious Word

We have, as we expected to have, a few new subscribers who do not like the little touch of the reformed spelling which we allow. As in the case of Dr. Fell, they do not like it, and the reason why they cannot tell, but this they know full well, they do not like it. Just so their grandfathers did not like it when Noah Webster dropt the useless *u* in *labour* and *honour* and the supernumerary *l* in *traveller* and *travelling*. We now would rather be offended by the restoration of these superfluities.

The conservatism of the few who have registered their complaints we respect. Any change to which one has become accustomed is disagreeable, a fashion in clothes as well as in spelling. The "French" style of trousers seemed vulgar and atrocious seventy years ago to those who had

worn the kind we see in a statue of Benjamin Franklin or Daniel Webster.

But progressive civilization means improvement. Everybody knows that the English spelling is lawless and abominable. No other language is so bad. Other languages, French, German, Spanish, have reduced their spelling almost to a phonetic standard, while English lags behind. Yet we have made immense changes in spelling in two centuries. How strange Shakespeare's spelling would look to us, as bad as the black letter. We improve everything else; why not our spelling?

The simplification is not sought for the benefit of us old people. How we labored over spelling in a childhood we have almost forgotten. Some of us succeeded by hard knocks and a good memory in learning it; others of us are mortified every time we write because we cannot spell. The pronunciation of the word is no guide to us. Of all things why should we hug our insane spelling, when we pride ourselves on reforming everything else?

We, THE INDEPENDENT, must look forward, not backward. We must consider the next generation, not the one passing away. Will our critics think of this, that it is our spelling more than anything else that makes learning at school so disagreeable to our children? Will he consider that it puts off the education of an English-speaking child a full year? Our children at school are behind German and other children chiefly because so long a time must be spent in learning to read and spell after a shockingly bad manner. So we say to our friends who have learned to love their senseless idol, Think of your children; think of your neighbors's children; think of the generations to follow; think of the millions of wasted years of millions in the future, and be patient, be unselfish; endure with Christian fortitude what you don't like, the little touch of simplified spelling we give you; and we promise you that some fair day after you are dead and gone it will seem natural to your descendants to read our noble tongue as they pronounce it, purely phonetically. If we might only live to see it! Fly swifter round, ye wheels of time, and bring the welcome day.

A Strange People

There are strange people everywhere, but China has its full share of them. Two recent events illustrate this fact.

In one of the cities there were about three hundred lepers. They were driven out and lived by themselves in the open country near the city. But there arose a bitter feeling against them. The Catholic mission there asked the magistrates to turn the lepers over to them for care, and the magistrates pretended to accept the offer. They began the task, when an order was given that the lepers should all come together at a certain place. They came and found a large deep pit dug in the ground. The lepers were required all one by one to descend into it, and were then all shot and killed. A search was then made for all suspected of the disease, and they too were killed. That is what passes as sanitation; prophylaxis, stern and effective; the survival of the fittest, the perishing of the unfit.

Now for an illustration on the other side of human character, no longer cruelty but self-sacrifice. The famine sufferers of Wenchau have stirred the compassion of a young woman who visited them, granddaughter of a magistrate in Kiangtse, named Im Shih-chan. She therefore offered herself as a sacrifice in marriage by a lottery scheme. The lottery was to be opened the first of February in Shanghai, and there were to be 30,000 tickets at a dollar apiece. There is absolutely no restriction to high or low, and the purchaser of the lucky number was offered not only a pretty and educated wife, but with her a dowry of $5,000. Among those who have approved the scheme the

names are given of magistrates and generals, and that of our friend Wu Ting-fang; and it is permitted by her brother and friends. She is said to have had the revolutionary spirit to a high degree, and would have joined the Amazon Corps last year but for family objections.

Good News from Germany

For European peace nothing is more essential than the putting of an end to the mutual suspicions of Great Britain and Germany, which have burdened both countries with the tremendous cost of an enormous and needless navy. Britain determined to maintain its navy equal in strength to any two other navies, while Germany, which claimed the most powerful army in Europe, seemed to plan also a navy equal to that of Great Britain.

Great Britain has for years been trying to persuade Germany to come to an understanding as to a limit of expansion, but nothing has, until this last week, come of it. A year ago Winston Churchill, First Lord of the Admiralty, proposed that an agreement should be made by which the two navies should be kept at the ratio of sixteen for Great Britain to ten for Germany; and now the indications are that Germany will accept the agreement. Admiral von Tirpitz, the Naval Secretary, had a meeting last week with the budget committee of the Reichstag, discussing with great secrecy the naval estimates, and the semi-official report represents him as saying that a "sensible agreement" as to the respective strength of the two navies was "something to be welcomed." On the next day he referred directly to Winston Churchill's proposal of the ratio of sixteen to ten, and said, as reported, that from the German standpoint there need be no misgivings as to the maintenance of such a standard between the two countries.

German and English journals receive this as nearly equivalent to a definite agreement and hail it with great satisfaction. Possibly a decision on the part of Germany to accept the agreement may come from the fact that she has no colonies that can support her navy as has Great Britain. Canada and Australia and South Africa are bound to grow rapidly in strength, and their decision to build dreadnoughts of their own will bring, in case of war, additional strength to Great Britain with which Germany, with her expensive army, could not compete. If this intimation from Germany proves true it will be another great occasion for credit to Mr. Asquith's Cabinet.

In Brief

It will greatly please us, and a multitude of others, if Mr. Taft should veto the immigration bill which has past Congress and which makes inability to read a bar to immigrants.

The return of the British suffragets to militant methods proves them hopelessly and crazily illogical. They deserve sympathy for their invincible ignorance, and the restraint given to dangerous lunatics.

Mr. Berger says that the defeat of the Socialists in Milwaukee at the last election was due to the united Catholic attack on Socialism. We doubt not it had no little effect, tho not the sole cause of the coalition against the Socialists.

For a century and more they have had Protestant ministers in India, but it is only just now that a Church which governs by bishops has consecrated a native as bishop. They were not so slow about about trusting the natives in the early times.

We hope that the present Congress will enact the bill before the House which forbids the interstate shipment of intoxicating liquor into "dry" States. It is opposed bitterly by the rich beer and whisky interests, and whichever way a Congressman votes he is in danger of losing his seat for it.

A Catholic journal finds the Protestant church communicants in the United States, according to the last census, to be 23,382,000, and they have 205,686 churches, or one for every 115 members. The Catholics have 15,015,569 members, and 13,939 churches, or one for every 1150 members. The Protestants would seem to be over-churched.

It is very easy for a member of a State legislature to vote to refer to the people the question whether they will adopt female suffrage, as the assemblies in New York and Pennsylvania have done; but it does not mean much more than encouragement to those who favor the reform; it is far from giving assurance.

In an address before the Virginians, in this city, Thomas Nelson Page has this to say on "Dollar Diplomacy":

> What is the result of it? That on this continent we are the most universally hated people between the two poles; that across the seas we are held in what often appears to be little less than detestation.

Is it quite as bad as that? Do visitors to Europe find it so?

Can we believe it—Florida turning to the Republicans? But at a meeting of the Florida Citrus Exchange resolutions were adopted to the effect that if the next Congress should remove the duty on oranges and lemons they would "repudiate" the Democratic party and pledge themselves "to support a party that will protect our homes, industries and lives from the disastrous influence of imported products."

The late fear of massacres in Turkey in the event of a Bulgarian attack on Constantinople is illustrated by the report of the Sister Director of a French convent in Smyrna. She tells of a man employed by the convent as protector and servant, greatly devoted to her, altho a devout Moslem. She asked him if he would defend them in case of a massacre, and received this comforting reply:

> If I do not receive orders to the contrary. I cannot disobey the Padishaw, but you may be assured, Mother, that if such a thing does happen, in order to save you from an atrocious martyrdom no other hand than mine shall kill you!

We suppose it is of some helpful financial profit to Reno, Nevada, to cultivate prize-fights and invite candidates for divorce. Nevertheless the shame of it ought to count for something on the other side. And Nevadans begin to feel it. Hundreds came by special trains to Carson City to strengthen the members of the Assembly in support of a bill to make the term of residence before divorce a year instead of six months. They managed to get it thru the Assembly by a close vote, but the law would not go into effect till next January. The Senate is doubtful. The uniform marriage and divorce laws are a great need.

We have been told that never before have so many scholars been taking Latin; but the number of students in the high schools of Wisconsin who took Latin decreased twelve per cent last year. Another item of interest from the U. S. Bureau of Education is that during the year our theological schools received $1,680,000 of private benefactions.

Somehow Korea (Chosen) does not seem very attractive to the Japanese as a place for residence. By a recent census the Koreans number nearly fourteen million, and the Japanese in Korea 210,689; but of these 41,469 are officials and soldiers, leaving 169,220 Japanese engaged for themselves in agriculture, commerce, etc. In Japan the annual increase of population by births over deaths is about half a million, but only a small part of the excess goes to the neighboring Korea.

It is pleasant to see proofs that those were in error who foreboded great loss to the Church if Church and State were separated in France. The French correspondent of the excellent Jesuit journal *America* quotes the president of the Catholic Association of French Youth as proving that "the separation of Church and State, which was destined to ruin the Church, has served on the contrary to develop her energies and increase her influence." That was our forecast.

The British Parliamentary mill grinds steadily, and still the meal is good for the people's food. The Welsh disestablishment bill has been past by the Commons, and will be rejected by the Lords, we presume, altho the certainty is not as positive as it is with the home rule bill. But what Ireland got decades ago the people of Wales are sure to get; and another generation will in England and Scotland just as surely make the Church and the schools independent of all State connection, as in this country and in the British Colonies.

General Nogi, who, with his wife, committed suicide on the occasion of the death of the Emperor of Japan, is regarded as the representative of Old Japan. An illustration of the regard in which women were held appears in the name given to a hill called the Wife-returning Hill. While on military maneuvers he stopt one night near a hill, and while there he was told that his wife had come from Tokio and wished to see him on urgent business. "Who gave her leave to come?" said he, and he refused to see her, and she had to be satisfied with sending a message thru an officer.

The Baseless Fear of War

By Andrew Carnegie

[To counteract the growing menace of militarism in this country and to promote constructive measures leading to the substitution of law for war has been for many years one of the chief aims of THE INDEPENDENT. We take special pleasure, therefore, in presenting to our readers this article showing the absurdity of taxing our people under the pretext of averting an impossible invasion. No living man is better qualified to write on this subject than Mr. Carnegie, who has freely expended his energy and money in promoting the ideals of international peace and justice, as shown in the endowment of the peace movement, and in the building of the Peace Palace at The Hague, the Pan-American Union at Washington and the Central American Court of Justice at Cartago, Costa Rica.—EDITOR.]

Officials under the present administration have recently become prominent in surprising efforts to increase our naval and military forces, the latest and most startling being Colonel Goethals's estimate of no less than 25,000 soldiers as necessary to guard the Panama Canal, strongly fortified against naval assault as it is. Under present conditions no sensible man would object to adequate protection of our whole country by the army and navy, but surely this is madness.

The pending demand is for three battleships this session, but General Wood tells us that the Canal once opened is to require more battleships than hitherto, differing in this from the President, who has assured us that only one battleship per year would be required after the Canal was opened, because our fleet could then be transferred either to the Atlantic or Pacific as required, thus doubling its efficiency.

Mr. Roosevelt holds "that there is but one way to maintain international peace, and that is by keeping our army and navy in such a state of preparation that there will be no temptation on the part of someone else to go to war with us." "Someone else" is indefinite indeed. Our Republic has no one who wishes to go to war with her to-day, and has not in our day had one desirous of doing so, altho Mr. Roosevelt when President was once strongly frightened. He had proclaimed his policy to be one battleship a year, not to increase the present navy, but only to maintain its efficiency, but he applied for four warships next session of Congress. The dreaded foe has not yet appeared. His fears were groundless. It is stated that we, remote as we are from danger, are now spending about 70 per cent of our total expenditures upon army and navy, including pensions, while Britain, in the very center of the only strong military and naval powers, spends only 43 per cent of hers on army and navy, which seems incredible. It is high time we should look into this.

No one ventures to name the nations or nation that has the faintest idea of quarreling with us, nor have we any idea of quarreling with any. All we have to do is to show our confidence in the continuance of present happy relations with all and cease expanding either army or navy.

Our military and naval officials fight imaginary foes when they think of possible invasions of enemies. The Republic, having no designs of territorial acquisition nor powerful neighbors, has no enemies to fear. It is the reverse with European lands joined together, each armed against the other as probable invaders. We expect those of our military and naval circles to dwell in their dreams upon possible attacks, devising counter measures of attack and defense —"'Tis their vocation." But to any proposal of increast army or navy we hope our President-elect's response will be—"Pray tell us first against what enemy you need this further protection. Name the power or powers and tell us what object they can have for attacking us, how they can benefit therefrom—what end in view." There are today only two navies greater than our own, those of Britain and Germany. We

rank third. Does any sensible man, Naval and Military officers excepted, fear war between the two parts of our speaking race? Is not this unthinkable? As we have outgrown the duel so have we outgrown homicidal war. English speaking men are never again to assail each other. That day has past. Has there ever been danger of war between Germany and ourselves, members of the same Teutonic race? Never has it been even imagined. America, Britain, Germany in China marched their united forces under a German general to Peking, and so will these three Powers some day unite again when danger requires. We are all of the same Teutonic blood and united could ensure world peace. The fourth naval power is our ally of the Revolution, the sister Republic of France. Could even an American admiral or commanding General succeed in believing that war was possible between the two Republics? This would be found beyond even the wildest flights of his vivid imagination. The Taft treaty submitting all questions to arbitration was signed by three of these Powers, Britain, France and ourselves, Germany thru her Ambassador in Washington by order of his government assuring us of her desire to become a party to a treaty.

This would have been the beginning of the end. These Powers, once united for Peace thru arbitration, intimating to any civilized Powers threatening to break world peace that such action would not be favorably considered and asking that their policy of peaceful arbitration be adopted instead, would not, could not, pass unheeded and peace would be preserved, and the foulest blot upon Civilization would thus have been erased. The treaty failed unexpectedly to get the required two-thirds vote in the Senate, but let the peacemakers be of good cheer. We hope and believe that the incoming administration is to renew the effort and succeed. There can be no such word as fail in a cause so noble.

Let Wood, Mahan, Goethals and others, admittedly the rite men in the rite places, indeed rarely equalled, give us one good reason why any nation should desire war with us. When they do this to the country's satisfaction we should listen, but not till then. To name our probable invaders and describe their means of invading us would banish all ground for anxiety. Think of a European power having to transport an army and its supplies across the Atlantic to attack us, always keeping in mind the question why and with what object. Thanks to our Constitution, if we must repel invasion we shall have the advantage of a civilian commander-in-chief in the President and not a professional theorist, incapable of judging questions of general policy. Here we are reminded of an axiom in business, "beware the expert," especially those whose life work is dreaming of wars which seldom or never happen. Our naval and military officials must dream of wars since most of them never even see one. They resemble our warships, few of which ever fire a hostile shot, but parade round the world showing their guns as peacocks display their feathers, always ornamental, but seldom useful. Lincoln with a Stanton, a Grant and a Sherman, is the ideal —not one of whom but came direct from civil life to defend his country. It would possibly be our best policy to invite our invaders to land; guide them into the interior as far as they would go—getting in they would find easy, but when it came to the question how they would get out it would be another story—surrounded as they would be by hundreds of thousands of sharp-shooters from every quarter of the compass.

Our Republic, soon to number 100,000,000 of free and independent citizens, our men old and young ready with their rifles to do or die for their country if attacked, surely every man, even the narrow professional soldier in his sane moments, must realize that no such hair-brained madness as invasion will ever be attempted. Our harbors could easily be torpedoed before the enemy could prepare and arrive.

Men who refused today to walk abroad without lightning rods down their backs with a ground connection, because men have been struck with lightning, would be the counterparts of those who fear invasion. The first risk, however, being much greater than the second, insurance companies would make huge profits by selling even at a dollar a head life policies against invasion—all would be clear gain less cost of printing. Falstaff's foes, both in "Buckram" and in "Kendal green," were scarcely less imaginary than the fears which apparently surround and appal most of our present professionals, able men as these are in their respective fields. Not one of the three additional warships demanded this year, if built, in all probability will ever fire a shot against a foe, but rust into uselessness—forty-five millions of dollars needlessly squandered. What a waste of capital that could be put to useful ends in improving for the masses the conditions of life. There is to be an end of this folly some day. A man's profession is his hobby; therefore if generals are to decide how many soldiers we are to maintain, and admirals how many fifteen-million-dollar battleships we are to build to rust away, farewell to common sense, for there are no extremes to which men's hobbies may not lead them.

True, few if any of our officers of today have ever seen war, and thank God fewer still are ever to see it, but the professional hobby takes root early and grows apace. The writer believes that the President-elect will prove a man of sound judgment; that his first care will be to guard our country from present obvious dangers, while consigning imaginary dangers of the future to the future they belong to—that future in which so many of our imaginary troubles vanish. A story told the writer in his youth has been and is still fruitful. Condoling with an old man upon his numerous misfortunes the reply came, "True, I have had many grievous ills to bear, and the strange thing is that nine-tenths of the worst of them never happened." So with our Republic. She bears a charmed life and all works for her good. Would that her officials of today had proper confidence in her future and more faith in her star. She has not an enemy in the world, nor need she have. The rulers have no cause of complaint against her. The masses of the people in all civilized lands see in her the standard to which they fondly hope to attain and they love her. Hence an army and navy, maintained at present standard, are ample and more than ample. We have no enemies, all nations are our friends and we are friends of all.

New York City.

Thy Crown

By Annie L. Crowell

Bartered or sold or lost?
Or tossed
Where the whirlpool draws it down?
That which thou hast
Hold fast,
And let no man take thy crown.

Lost for a secret thrill
Of ill,
Or a sudden sweet surprise?
Bartered for lustful sense
Intense,
That parades in love's dear guise?

Sold for a moment's charm
Of har
That shall pall before the day?
Tossed to the sullen throng
Along
The low curb of life's highway?

Bartered or lost or sold?
Pure gold
And the pledge of high renown—
That which thou hast
Hold fast,
And let no man take thy crown.

Amherst, Mass.

A Housewife's Defense of Cold Storage

By Alberta Cory Matthews

[We hear so much about the abuses of the cold storage system nowadays that we are in danger of forgetting what a vast improvement it has made in our means of living.—EDITOR.]

In these days of investigations and exposés, it seems to be the custom to find some scapegoat to bear the blame of any unsatisfactory condition, whether it be moral, social or financial. If that scapegoat can be found in something wholly intangible and abstract, so much the better, for that obviously does away with the necessity, sometimes embarrassing, of imposing a penalty upon the offender.

All but a negligible number of individuals are more or less interested in the high cost of necessary commodities. This is very evident in the daily press and magazine literature of the period. In fact, I am not sure that if one were to review the entire output of the publishers for the last five years to try to find the "trend" of the times, that the economic condition would not be found to be the most important influence. Perhaps our period may be designated by the student of the future as the "Period of Discussion of the High Cost of Living." This may be but a passing phase, or it may be a permanent contribution to literature like the "Period of the Renaissance." Be that as the future may determine, it has led to much agitation and some investigation. We have accused various trusts and monopolies of being the guilty ones in this matter of high prices, but if one can judge by results attendant upon their annihilation, they were not so very guilty after all, and we have been put to some embarrassment as a legislative nation by the fact that the dissolution of trusts does not seem to lower the cost of sugar, of oil, or of bath-tubs.

Happily the general consumer has alighted upon a cause sufficiently tangible to rail against, but not sufficiently tangible to necessitate violence, cold storage; not cold storage in the sense of an institution, but purely as an abstract principle. Cold storage keeps the prices up all the year, we hear. That is undoubtedly true, and quite in keeping with other modern conditions of living. We city dwellers would suffer more than we have any present understanding of if we were reduced to the primitive conditions of alternate seasons of plenty and of famine. There would, of course, be times when food would be cheaper than it now is. Also there would be times when it would be much higher than now if, in the case of certain perishable products like butter, eggs and fresh meats, it could be bought at all. If it were possible for us to buy, during the summer or productive season, enough fruit and vegetables to last us thruout the year; if we could then keep it fresh and wholesome until we were ready to consume it, we would be in position to say *a bas* cold storage. But we are in no such position. Dwellers in the country are much more independent of such public commodities than city folk. They can buy apples and potatoes and other of the less perishable foods in time of plenty, and bury them in the ground until those things are scarce and high, and then go and dig them up if they can find them and eat them if they have not been too badly frozen. But we of the city would have no place to bury them, we would have to buy ice to keep them on and then they would be in cold storage. If we could only hibernate like the bears during the non-productive period of winter, then we could bid defiance to cold storage. But men are not bears, that is the majority of them are not, and they must work, and if they work they must be fed, not only in the period of production, but also in the period of barrenness.

As for me and my house, we like June butter in January better than

January butter, and we like fresh apples better than dried ones; we like spring lamb all the year, and roasts and steaks better than corned beef or dried beef. We know, too, that none of these preferences would be possible for the ordinary New York City dweller without cold storage. It is an instructive exercise for us occasionally, while we reckon up the weekly expenditure, to take the time to reckon up how much of the week's provisions have come to us from cold storage, and refrigerator cars, and to consider what we could have substituted for those things, had we been unable to buy them.

Even if we were able to buy our supplies for the year during the productive period, when things would be over-abundant and consequently cheap, we would still be dependent on the refrigerator cars which bring the products from all parts of the continent, and the steamers with their great cargoes of fruit and vegetables, both of which are cold storage houses adapted to traveling. But we have to buy also in the nonproductive time when the prices would exceed even our cultivated imaginations, if indeed sufficient food could be obtained in such a city at any price for wholesome living. Salaries and incomes of city dwellers do not vary greatly with the seasons. The average family has no more money to spend for food in the winter than in the summer. This average family will therefore suffer no great inconvenience from the equalization of prices of which cold storage stands accused, and has the unquestionable advantage of an all year's supply of food instead of the natural periods of plenty and famine.

I am not contending that commodities are not too high. They are unreasonably and unnecessarily so; but I do contend that it is not due to cold storage as a principle. What we may be able to do, as a legislative nation, to control the profits of the cold storage warehouse men we do not yet know. In fact I doubt whether their profit would be found to be an abnormal one.

While we are at it we usually blame cold storage for any unwholesomeness in the food we buy. If we encounter a stale egg at breakfast, about the worst name we can call it is "cold storage egg." If my grandfather had been a city man instead of a farmer I have no doubt that he would have occasionally had this same experience of finding an egg which he would probably have described as "not getting any better," and there was no cold storage in his day. In fact I am not quite sure that being a farmer would put it out of the range of possibility. At any rate I have bought eggs fresh from the farm that were, to speak charitably, open to indictment. If eggs shipped from the country and put into cold storage are not fresh when they go in, obviously no amount of cold storage will freshen them. Not all Dr. Wiley's refrigerator cars nor all of his men can make Humpty-Dumpty a fresh egg again. The same thing is true of chickens. Also they may go into cold storage fair and fresh, and come out in prime condition, defying detection; but if they hang for ten days in the butcher's box you will detect it and there will be no defiance about it. The trouble is not with cold storage but with the warm storage that may precede or follow it.

Dr. M. E. Pennington, of the Food Research Laboratory, Department of Agriculture, who probably knows more about the subject of cold storage food than anyone else in the country, in the November number of the *American Journal of Public Health*, says that May and June eggs properly chilled and stored are much better in August and September than the best so-called fresh eggs the market affords. Dr. Pennington also tells us that the housewife should receive her poultry in a frozen condition and thaw it out in her own refrigerator. I have seen women refuse a frozen chicken on the ground that it was a cold storage fowl, and take home one thawed out in the butcher's box.

If anyone doubts the effectiveness

of cold storage in preserving food in a wholesome condition he has only to reflect upon some of the miracles of modern surgery, particularly the work of Dr. Alexis Carrel of the Rockefeller Institute. Dr. Carrel has been able by means of cold storage to preserve tissues and organs for long intervals of time, so perfectly that when again placed in a living body or supplied with proper nutrition they will grow and resume their functions. That means certainly that those tissues have remained absolutely unchanged during the period of cold storage. Aside from the enormous surgical significance, there has never been an argument for the possibilities of cold storage which had the tone of finality that these instances present. If a kidney or a liver or a heart can be kept for an indefinite time in such condition that it can resume its normal functions for surgical purposes, there is no reason why the same and other tissues intended for food cannot be kept with the same effectiveness.

This the public would no doubt say is an extreme case. That is true with regard to the intelligence of the procedure. The tissues are intelligently treated and intelligently stored, but the method is the cold storage method, the only method in use whereby tissues may be kept indefinitely in the condition of living organisms.

The trouble with our food, then, is obviously not that it is cold storage food, but that there is lack of care in the manipulation of it. If Dr. Carrel permitted his tissues to reach a stage of decay before subjecting them to refrigeration or after removing them from cold storage, no amount of carefulness of handling them under refrigeration would induce them to grow again.

With the enormous growth of our cities and the consequent demand for an all-the-year food supply has come the development of machinery for mechanical refrigeration, so that we are now practically independent of the natural ice crop, always uncertain and usually unwholesome. We have under these conditions, and because of them, developed an enormous industry which most of us view with interest and not a few with suspicion. This suspicion has been fostered by an attendant increase in the price of food products. Many States have passed laws, wise and otherwise, for the regulation of the cold storage industry. In others legislation is pending. Just what is best to do in the matter of legislation it is difficult to determine. Certainly the matter of what we shall pay for our food ought not to be wholly in the hands of any one industry, particularly one upon which we are daily becoming more dependent. Nor should the matter of sanitary handling be left wholly to the discretion of that industry, tho no doubt it is more profitable to handle goods with as little deterioration as possible. Regulation of profits and thoro inspection may be brought about without crippling the industry, and with no injustice to the consumer, by discreet legislation. The matter of distribution can be largely aided by the housewife if she will but insist on having her products delivered to her fresh from cold storage, and in case of such things as poultry and game, still frozen.

Legal regulation of profits; inspection of consignments and of warehouses—not a cursory glance at the outside of a package, tho that would in some cases be quite sufficient for condemnation—not by a policeman or a ward politician, but honest, competent inspection; rapid distribution of products so that they reach the consumer in as good a condition as when they leave the warehouse; these can be brought about with but little effort and would do much toward establishing an attitude of responsibility for, and confidence in, the cold storage product, to the mutual benefit of the consumer and the cold storage interests.

Leonia, N. J.

Comfort

By Alfred Ollivant

[This kindly bit of realism, one of a series of Sketches of Everyday Life, is just what we should expect from the author of that most fascinating of dog stories, *Bob: Son of Battle*, and its scarcely less popular successors, *Danny, Redcoat Captain, The Gentleman* and *The Taming of John Blount.*—EDITOR.]

Last night I had one of my attacks of loneliness.

The pain was with me still when I woke to the sound of rain.

After breakfast I went out. It was just half-past eight as I reached Palace Gate. The sky was dull, Kensington Gardens empty. I turned up the long walk that runs eastward between flower-beds and shrubs, backed by forest trees.

Down the walk a homely middle-aged man in a Norfolk jacket and soft hat was walking swiftly, two little boys, and a girl playing about his feet. The girl was a slight elfin creature in a blue skirt and a blue jersey. Her head was bare, and her hair tied up in two pigtails, one of which she held defiantly in either hand as she came skipping down the walk towards me, taunting her little brothers.

The only other soul in the long walk was a stout woman of the people in dowdy black, walking just ahead of me.

As the children passed us, she turned and looked back at them, the kindness on her face.

"Nice children," I said, as I caught her up.

She turned her good colorless eyes to mine.

"Yes," she said, "enjoying a romp with their dad. Oh, I do like to see children enjoy theirselves—the children of the poor as well." The words checked the free flow of my spirit towards her. She was clearly poor herself, so poor that for a moment I thought that she might almost beg of me. My wall of egoism rose in self-defense.

Her next words dispelled my fear.

"The other day up at the kiosk—I work up there!—a poor child came up with its penny among the children of the 'ristocracy and 'eld out its little 'and. Of course its penny was as good as theirs. But the Guv'nor, he said: *'Get out! Go along with you.'* Her voice became deep and harsh and grinding as she mimicked the tyrant. 'Oh, I was sorry for the child, because its penny was as good as theirs. But the ladies and gentlemen wouldn't like it. Well, well. We shall all be equal one day.' "

There was no class-feeling in her words.

It was the woman, and not the wife of the working man, who spoke.

"When that great ship went down the other day," she went on in her contented way, "it was rich and poor alike, you see."

Together we walked along. It began to rain and I put up my umbrella and held it over both our heads. A gray, bemedaled parkkeeper passed us. He cocked a wary eye at me, in which laughter and mockery lurked, and touched his cap.

"They won't want us at the kiosk to-day, I don't expect," said the woman at my side comfortably. "Nothing's doing when it rains, ye see. Last night it was the same. Only it was very unfortunate," she continued in that quietly confidential way of hers. "Monday's pay-day, ye see; and my husband who's out of work said he'd come to meet me. Only I'd gone before he came—because of the rain. Thought I'd get home before he started and give him his tea nice and cosy. But he'd left—to meet me. So I slip out to my daughter who lives a few streets off. And he waited up here from four to half-past six. And when he come home, I wasn't there."

"Was he cross?" I asked.

"Well, he wasn't too friendly," she answered. "Didn't say much. Never

does. And he wasn't all right this morning. I hate to leave him unfriendly at home when I go. 'Tain't as it should be."

We walked on under the umbrella.

"It's kind of you to hold your umbrella over my head, sir." she said. "Only I hope it goes on raining. Then I can get home early and make up our quarrel."

We had come to the end of the walk. The kiosk stood on the left upon the grass under the trees.

"That's where I work, sir."

We turned off towards it, rubbing shoulders under the dripping umbrella.

"What's your job?" I asked.

"I'm cook, sir. There's just me and a chef. But I do most of the cooking. He attends the carving and that. Just luncheons and teas, you know. People telegraph us. Make parties up. Omelettes, you know, and poached eggs, and salmon mayonnaise. All of the best. Bread and milk and eggs. Of course it's for the 'ristocracy. They get it nicer than they would in their own homes, and I dare say a bit cheaper."

My confidante, who was carrying a postcard in her hand, now raised it to her eyes.

"I got this just as I came out," she said. "Only I can't read it because I've left me glasses. It's from my daughter, I expect. She's a parlormaid; but the piano tumbled on her foot. And her mistress sent her away to a convalescent home. Could you read it, sir?"

I took the card; and my heart was tender.

If the poor have something in the way of knowledge to learn from us, how much more surely have we to learn of love and truth from them?

I read the spidery writing:

"Dear Mother:

"My foot is painful still I expect because I walk so much only I do enjoy it so hear: I hope your—your—."

There was a word I could not read.

"My shoulder," she suggested. "I 'ad an accident."

She had given me the clue.

"I hope your accident is better and that you and dad are well.

"Your loving daughter,

"NELLIE."

The letter ended with a shoal of little crosses.

"Yes," said my companion comfortably. "I got ten children—all alive."

We had come to the kiosk.

"Thank you for holding the umbrella over my head, sir," she said, and turned in.

I walked on. It began to pour; but I was no longer lonely.

The Comforter had come to me in the guise of a fat woman, the mother or ten, and wife of a working man who was cross with her.

Elliotts, Horsham, England.

Duty

By F. W. Martin

I SIT beside my little mill
And grind the livelong day;
The sun comes out beside the hill
And all the world looks gay;
But I must grind, and grind, and grind
So is the manner of my kind.

My grist is only common meal,
And scarce suffices me.
Altho a part to all I deal,
Few thankful looks I see.
They snatch my loaf and go their way,
Nor note who served their lives today.

Well, I've a mind to quit my mill
And loaf about the town;
Like other folk, to have my will,
Nor bear with fortune's frown—
Why should I grind for senseless clods?
Peace, fool! Perchance thy mill is God's.

The Motion Picture and the Church

What the Churches Are Doing and Hope to Do with This New Educational Agency

By Carl Holliday

Author of *The Wit and Humor of Colonial Days, English Fiction, A History of Southern Literature, The Literature of Colonial Virginia, Once Upon a Time Stories,* etc. Recently head of the English Department, Vanderbilt University, Nashville, Tennessee.

Recently the Rev. W. H. Jones, pastor of the First Reformed Church of Valley Stream, Long Island, after seeing a moving picture based on the story of Bunyan's immortal "Pilgrim's Progress," returned to his congregation, handed in his resignation, and said: "I realized that I was wasting my time, for I had before me living characters whose actions as they unfolded their sublime story were far more potent than anything I could say in the pulpit. . . . A religious subject, thus tactfully and reverently treated, in my opinion, will do more to advance the cause of religion and to uplift humanity than a thousand eloquent preachers ever can hope to accomplish by their oratory." The clergyman then procured a motion picture projecting machine, proceeded to Freeport, and gave an exhibition at which, it is declared, every member from every church in the town was present. The peculiar phenomenon in so large a gathering of churchgoers to hear a pastor was that none fell asleep.

ISABELLA OFFERS COLUMBUS HER JEWELS.
From "The Coming of Columbus" (Selig.)

That the motion picture is to become one of the most powerful agencies ever employed in the work of the church is the conclusion reached by many of the prominent leaders in religion and social uplight in America. "Each day," said Thomas A. Edison, in a recent conversation about the use of cinematography in the public schools, "I want to put in a little drama—a short one—showing some simple story that will interest the children and will teach a moral; something where the good boy gets rewarded and the bad one punished." This sort of thing treated in a book would simply disgust or irritate the average boy; but when he sees the actual deed and rewarding going on before his very eyes, the effect is different; he cannot escape the impression that here is actual life and that right-doing is an admirable thing. This is the idea that recently prompted Professor Milton Fairchild of Baltimore, in a lecture before the teachers of Topeka, to advocate the appointment of a "moral instructor" by the University of Kansas to go about the State with a motion picture giving "visual instruction" in the effects of righteousness and wickedness. That the moving picture is training the sympathy of the modern child can scarcely be doubted. I, myself, noticed children crying in a little theatre when they saw the innocent boy in the picture taken into his home to be punisht for a deed he did not commit; when I was a youngster we stood giggling outside the door waiting with unholy glee for the first sounds of lamentation.

It is this very ability of cinematography to expose injustice, cruelty, and suffering in all their naked ugliness that has impressed the clergymen and church workers with the

CHRISTIAN STARTS OUT

Leaving the City of Destruction, the hero of *Pilgrim's Progress* bids good-bye to his family and friends. From an Ambrosio film.

importance of this marvelous invention of the last decade. In the teaching of the young and of the morally deficient, therefore, it is destined to hold a larger place than many people realize. Thus, when we find two such widely different institutions as the State Penitentiary at Olympia, Washington, and the Episcopal Sunday School at Bristol, Tennessee, using the pictures for the same purpose — the impressing of the lessons of decency, health, industry, honesty, and love— we may wisely conclude that here is a weapon against evil more versatile than any other yet discovered by man. The love for the drama is instinctive in the human race; the savages of Africa and Australia perform crude plays and imitations of hunting and war; civilized America spends more than three hundred million dollars annually for its more finished tragedies and comedies. The enacting of a deed from life will ever be more powerful than the written or spoken word, no matter how talented the author or the orator. This newcomer in the histrionic field—this "silent drama"—is one far more popular because far less expensive. It is destined to reach the masses where the legitimate theater has reached only the classes.

This phase of the matter recently prompted the pastor of one of the most conservative churches in America to bring the picture projecting machine not only into the Sunday School, but even into the church auditorium. The oldest house of worship in Providence, Rhode Island, is the Beneficient Congregational Church, popularly known, because of its architecture, as the "Round Top Church." Its old-time members were startled when the pastor, Asbury E. Krom, recently declared the motion picture one of the greatest agencies for good the world had ever seen, and announced that his congregation would soon see one in operation in the church. The machine was installed and is proving itself a valuable aid in the work of the Men's Club, the Woman's Guild, the Young People's Society and the Sunday School, where it is used at the close of the lesson hour to impress the events and principles just set forth by the teachers. Apparently, however, its main value in aiding this particular church will be evidenced in the Saturday night entertainments where, according to the pastor, "there will be no charge, no collection," and where "in no way

will any be made to feel that he is under any obligation whatever to the church for the entertainment provided," and where a strong effort will be made to combat the neighboring saloons in which the neighborhood men squander their wages.

This brings forward another strange phase of the matter—the bitter battle now waging between the motion picture and the grog-shop, a battle in which the liquor dealers are undoubtedly losing. Members of the Excise Board of Washington, D. C., declared late in 1912 that cinematography was playing sad havoc with alcohol in the Capital. The number of saloon licenses, issued before November 30, 1911, was five hundred and thirteen; at the same date in 1912 the number had not yet reached two hundred; the reduction by two-thirds was attributed by a large number of the dealers to this new and better form of entertainment. A more distressing tale for the bartender comes from Pottsville, Pennsylvania, where in the first ten months of 1912 the picture houses drove almost exactly one hundred saloons of business. Each one of the discouraged dealers on reporting to the County Clerk that a renewal of the license would not be requested, declared that his own shop had been ruined because the little theaters not only attracted former customers, but prevented the development of new ones.

Of course, there are always a few old-timers who, thru force of habit, object to any new movement. Force of habit is a fine thing in some instances; doubtless it was what kept Methuselah alive so long. These persons, who live with their faces turned toward the "good old times," point to certain sensational pictures on the market; for the cinematography business, like the book-publishing or any other business, has a few pirates and moral degenerates in it. There may have been cases where such exhibitions incited thoughtless boys to wrongdoing; but, as the Reverend Herbert A. Jump, of the First Congregational Church of Oakland, California, recently said in a lecture at the University of California, "we are no more justified in eliminating the moving picture because of these occurrences, than we should be justified in giving up our public libraries because the story of adventure contained therein has moved nervous youngsters to unfortunate imitation. The moral standard of the motion picture films is quite as high as the moral

standard of the fiction and poetry of our public library."

There is, naturally, no claim that this innovation is to take the place of any present activity or department of the Church; it is simply a powerful auxiliary for the machinery already existing and a new attractive force in the hands of a moral worker. Its universality of appeal is strongly in its favor. All preachers are not equally effective or successful as orators or as social mixers; but here is an instrument that speaks the same language and the same lesson to all nations, and has more power in arousing a feeling of kindliness and brotherhood than any one individual or group of individuals. The moral uses to which it may be placed seem unlimited. For instance, at the Buffalo meeting of the Second Missionary Department of the Protestant Episcopal Church during October, 1912, it depicted the value and necessity of mission work at home and abroad; at the Flatbush, Long Island, Congregational Church it is used each Sunday in the "Children's Church" to illustrate the brief juvenile sermon by the minister; in the Christian Church of San Jose, California, it prepares the Sunday School pupils on Saturday afternoon for their lesson the next morning; in the Parkhurst Church of Minneapolis it attracts on an average six hundred children and grownups each Sunday morning; in the Park Church at St. Paul it recently furnished a genuine Egyptian background for a tableau representing "The Children of Israel in Captivity"; in the Congregational Church of Appleton, Wisconsin, it forms the basis for the sociological discussion on Saturday night, such as a recent debate on Woman's Rights, and on Sunday night furnishes the illustrations for the regular religious-social program, such as a recent one on Tuberculosis under the supervision of the Wisconsin Anti-Tuberculosis Association. Even the Pope has consented to appear in moving pictures, and his image may now be seen by thousands of devout Catholics who never dared to hope for such a privilege. In the battle against child labor, white-slavery, labor-conflicts, and vice development, in spreading knowledge of the Bible and Biblical lands, in the teaching of patriotism and brotherhood, in the general education and developing of the public conscience, it apparently is destined to play an enormous part.

Here, then, is a movement that cannot be ignored by the progressive church. Every agency is ready; cheap and safe projecting machines are now on the market; highly suitable church auditoriums relieve the institution of all rental expenses; practical artistic and eminently suitable films are available, and certainly a most willing and receptive audience is at hand. This new form is entering silently but effectively into the character of public education and modern life, and no student of the American social conditions as they really are can afford to be ignorant of its power or ignore its potentialities in economic, social, intellectual and moral uplift.

CHRIST ON CALVARY

From "Satan." (Ambrosio.)

The Coöperative Movement

By N. O. Nelson

[Many attempts have been made in past years to introduce coöperative methods of manufacturing and distribution into the United States, but they have met with little success, except in certain industries, such as creameries. Now, however, the American Socialists, in accordance with the recommendation of the International Congress, are starting coöperative stores to be used to promote their propaganda work, as has been done by that party in Belgium. In our issue of Jan. 9, 1913, Professor Munro gave an account of a successful instance of "Coöperative Shopkeeping by Harvard Students." Mr. Nelson is entitled to speak with authority on this question because he has devoted many years to the movement, not merely in speaking and writing, not in urging others to coöperate, not in theorizing on this subject, but in practical experimentation by starting various enterprises in different parts of the country and watching how they worked. The results of his experiments have been reported from time to time in THE INDEPENDENT. See "Profit-Sharing with the Customer," May 25, 1905; "Experiments in Coöperation." May 27, 1905; "Coöperation," Sept. 21, 1911; "Profit-Sharing," Oct. 19, 1911.—EDITOR.]

The coöperative movement goes along with increasing momentum the world over. Formerly we heard of little other than the British stores, now it is Denmark which most attracts the writers. Ireland, Germany, France, India, California, Minnesota, have wonderful figures to show.

Coöperation grows because it is profitable, because it brings people into association, because it brings the democratic spirit into business.

In a hard-headed, matter-of-fact way it solves the question of capital and labor by raising the capital among those who want to use it and giving to those who use it all that comes out of its use.

It does not now seem a wonderful discovery that a dividend on purchase should draw trade, yet that is what has made the Rochdale plan famous and unchanged for sixty-seven years. Probably ten millions of heads of families buy their goods or sell their wares and produce on this plan. They buy and sell at market price, and periodically divide the profits in proportion to purchase of goods or sale of produce or wages received.

The twenty-eight Rochdalers of 1844 with their $140 of capital have grown to 2,650,000 members in Great Britain alone, with a capital of $175,000,000, an annual trade of $560,000,000 and divisible profits of over $60,000,000. It should be explained that "trade millions" includes the wholesaling and manufacturing, the profits on which go to the retail stores, making the rate of dividend on the consumers' purchases about 15 per cent.

The coöperative principle has gone far beyond store-keeping. The Rochdale pioneers did in fact project a far reaching plan. They meant to save the profit on retailing, to make capital for self-employment and to buy land for homes and farming. The principle has been applied on a vast scale to business connected with farming, home-building and borrowing capital for production.

Some twenty-five years ago the buyers of butter and produce for the British stores found in Denmark indifferent and uncertain quality, and badly packed. They said to the farmers, "form a coöperative society, on your joint responsibility borrow the money to set up a creamery, employ an expert butter maker and manager and we will pay you several cents a pound more and take all you will make." This worked so well that it made the little kingdom the greatest butter producer in the world.

Working so well in dairying, it was next applied to coöperative slaughter houses, the refuse skim milk being excellent food for pigs. Then came Poultry and Egg Societies, Credit Societies, Supply Associations and Stores. Four-fifths of the Danes belong to Coöperative Associations. The Productive Societies have an Export Federation which exports annually 65 millions worth of butter, bacon and eggs. This has been done in twenty-five years.

Twenty-three years ago the move-

ment was brought into rural Ireland, an unpromising field. There are now over one thousand and fifty farmers' coöperative socities, three hundred and fifty of which are creameries. From being a byword Irish butter is seeking rank with the Danish. Even factory-ridden England has its Agricultural Organization Society.

Germany and Austria were the originators of people's banks or credit societies. There are some twenty-five thousand of them in the two countries. They are local associations, mostly farmers, usually without capital stock, but with unlimited liability. On the ample responsibility of all its members the society receives deposits and loans at low interests and lends to its members on security of fellow-members for profitable productive purposes only. Tho the loans amount to hundreds of millions a year, practically no losses occur and the money is freely loaned by the large city banks.

Not least important is the Poultry and Egg Society, which has the happy faculty of producing neither rotten nor stale eggs, thereby receiving a preferential price. A route man calls every two or three days, receives and weighs the eggs and poultry, carries them to the packing station where they are sorted as to color and size, then shipped, and when returns come back the route man makes payment to each on his next round. Each member of the society has a rubber stamp with number and date showing when and by whom eggs were gathered. The rules require that eggs be gathered daily from regular nests only. They must then be fresh and there is a heavy fine for a stale egg.

The Supply Associations buy fertilizers, feed seeds, and other large requirements. There are bee-keepers' societies, breeding sire syndicates, and finally stores. Most of the countries have wholesale stores owned by the retails.

The English Wholesale does the fabulous business of 130 millions a year, it manufactures a large variety of goods, in value over 30 millions a year, it has its own buyers in all parts of the world, it has tea plantations in Ceylon, elevators in Canada, and buys whole cargoes of currants in Greece. In these foreign affairs it is joined by the Scottish Wholesale.

Many millions have been invested in comfortable houses for members. There are coöperative building societies which take a large suburban tract, lay it out systematically, build and rent to the members, the profit on the rent going as payment on the tenant-members' shares, which eventually own the property—jointly.

The Coöperative Orange Association of California took the industry in a hopelessly demoralized condition a dozen years ago. It now has its own packing houses and inspectors at every station, supplies perfect fruit true to brand, has its own warehouses and salesmen in all the principal cities, keeps the market supplied but not over-stocked, warrants the grade and gets a corresponding price. Minnesota and the North Central States have between one and two thousand coöperative creameries and hundreds of elevators. Numerous truck associations and stores have been started in all parts of the country, but not many are properly organized or prosperous. They need time and experience.

It is safe to say that there are in the world over twelve million members of bona fide coöperative business associations doing a trade of much above a billion dollars a year, with net profits of over 100 millions. This business bids fair to settle the trust question, the labor question and, in the main, the pauper question, by making a voluntary trust for all the people, by self-employment and by work and fair living for all.

It is democratic by giving an equal vote to every member, equitable by giving all the profit to those who create it. It cultivates fellowship, saves money by economical methods, is strictly honest, having none to cheat but itself, and financially equipt for all legitimate business purposes by capitalizing its profits.

St. Louis, Mo.

Fox Frenzy

Breeding for Fur Brings in Millions

By William Young Chapman, D.D.

[The old romantic days of the pelt hunter and the Hudson Bay Company are passing away. We are no more dependent upon northern wilds for our furs than upon southern wilds for our rubber. Well-bred foxes and cultivated caoutchouc are better fitted to these unadventurous and systematic times. Dr. Chapman was born in Prince Edward Island and spends his summers there, so he is familiar with the novel industry he describes.—EDITOR.]

If I were to tell you that in a certain rather isolated island, fortunes have been made in the past ten years which in the aggregate amount to millions of dollars, and you should try to guess where that island is and what its source of wealth, you would be a good while guessing unless someone should give you a hint. Your thoughts immediately leap out in world-wide wireless circuits from South Africa to Alaska, to the Rand, to Kimberly, to Cripple Creek, to the Klondyke, to Cobalt, to Wall Street. You think of gold and silver and copper and precious stones, and coal and oil and natural gas. For from the discovery of such resources as these great fortunes have been acquired in recent times. No, you are off the scent and the scent is very palpable, too. Let me tell you.

Nestling under the great crescent coast of the Gulf of St. Lawrence, separated from the other Canadian provinces of New Brunswick and Nova Scotia by the Strait of Northumberland, is the beautiful Island of Prince Edward, known to all Maritime Province people as "The Island," looking on the map something like the leg of a drunken man in caricature, and nearly the size of Long Island, N. Y.

Settled very early in the history of North America by the French, who called it Isle St. Jean, ceded finally to the English in 1758, receiving its present name after the Duke of Kent, Queen Victoria's father, in 1798, it has been occupied thru all its history by a quiet, honest, industrious people who have gained a comfortable livelihood from its fertile soil and from the

fish in its surrounding waters. It has never known any other considerable source of wealth—no minerals, no extensive manufactures. But recently the whole island has been excited by the prospect of great wealth, and great wealth, relatively speaking, has been acquired by a few men in the novel industry of cultivating the Silver Fox.

The story of this industry is unique and exceedingly interesting. Twenty-odd years ago a farmer on the island, hunting one day for cows in the woods, discovered a fox-den in a hollow log, and from it carried home a pair of black-fox pups. Like the Boer children in South Africa playing with the white pebble that was found to be a great diamond, the farmer had little idea of the value of his find. He bartered the pups for a cow with a neighbor who conceived the idea of breeding from them, but after several years of unsuccessful effort he sold them for $80 to a man who lived on a small island off the coast of the main island. The new owner, with a more retired place to keep the little animals, and perhaps with better understanding of their nature, at any rate with better luck, succeeded after a couple of years in securing a litter and the game was on.

When it was found that a silver-fox pelt would bring many hundreds of dollars, and even thousands, in the London fur market, it was not easy for any man to keep the business to himself. And yet, until about three years ago, the industry was confined to a small district in the hands of not more than a half-dozen men. These men had conspired to keep the business as secret as possible and to hold it in their own hands. They learned by costly experience the nature and habits of the animals, how to confine them and care for them, and went on quietly increasing their stock, importing a few from other countries to vary the breed and annually selling a considerable number of pelts at prices as high as $2500 apiece.

The business could not be kept secret long. The friends and acquaintances of these foxy men began to notice that they were spending more money than ordinary farmers were used to handle, and the secret was out. The business burst its bounds. The foxes, so to speak, broke loose. A great demand arose for the live stock for breeding purposes. Applications came from near and far. Every farmer or combination of farmers that could raise enough money to buy a pair have made a start in the business. Many, unable to purchase pure silvers, have started with crosses hoping to breed out the red and ultimately develop pure stock. Business men have been attracted by the industry and companies have been formed with large capital to extend the industry on a larger scale. The business has spread over the island and has crossed to the mainland, and now there are scores of these fox-farms worth millions of dollars, when but three years ago there was a scant half-dozen. A very frenzy has seized the country. Men are fox crazy. "Fox" is the topic of conversation everywhere. You hear it and overhear it on the trains and boats, at the country store and at the casual meeting of neighbors. Everybody is speaking and thinking and even dreaming of black foxes.

The value of the silver-fox depends, of course, ultimately upon the value of its fur. The dark silver, commonly called the black fox, has been hitherto exceedingly rare, and its fur has gone principally to adorn the royalty of Europe. For that reason and also because of its exquisite beauty, it has been for a good while the costliest of all furs. A few years ago a black-fox pelt from Prince Edward Island was sold at auction in London for £580 or nearly $2900. That is said to be the highest price ever paid for the pelt of a single animal. The light silver, or pointed fox, is more numerous and somewhat less valuable, while "crosses" or "patch foxes" vary in value according to their approximation to the pure silver, grading down to the common red which is by far the

most numerous and least valuable, being worth about $5 per pelt.

When the fox-farming industry first broke its narrow bounds on "The Island," the live foxes were sold for nearly the value of their pelts, but the price has been mounting steadily upwards during the past two years. Recently, one of the pioneers in the business sold his ranch of 20 pairs to a company, with certain guarantees, for $625,000, and within a few weeks a gentleman from Russia visited "The Island" and purchased five pairs for $100,000. These are to be shipped to Russia and the industry established in that country.

Thus it will be seen what a sensation this new industry has produced in that quiet country. Think of it! A man may have lived for fifty years on his ancestral farm, with all its accumulated stock and machinery and buildings. He may have a herd of cows, a flock of sheep, teams of horses and other stock of an ordinary farm. With these and all the other products of his farm, he has been able, by frugality and incessant labor, to make a living for himself and family. But now, if he is one of the fortunates, he can take you back to some good-for-nothing thicket of bushes and show you a little animal, not much larger than a skunk and that smells like one, only not so emphatically, worth more in the market than all the farm with all its stock and produce and buildings and machinery.

Continue to think of it! Here is a man with an estate that looks to the passerby like an ordinary farm. There is no great mill or plant with smokestacks befouling the sky, no great crews of men coming and going, no grunting, shunting locomotives hauling back and forth the raw material and the finished product. There is but an ordinary farmer who knows nothing about metallurgy or mineralogy, nothing about the management of the world's big business, with no more education than he could get in a common country school during the winter months of a few youthful years, and yet, with an amount of work less laborious than tending a flock of sheep, pocketing shekels like a steel magnate or a hundred gold-miners. He can raise foxes more easily than he can raise sheep, and how much better is a silver-fox than a sheep! It costs about as much to raise a fox as it does to raise a bull-pup. The latter may be snatched from the watery grave of your neighbor's superfluous young canines for the price of carrying it home, while a pure silver-fox is worth twice his weight in gold.

The art of raising foxes could only be learned by experience. There were no precedents. The silver-fox has been kept in zoological gardens from time immemorial, but none have been known to breed in captivity until this successful experiment. The natural shyness and nervousness of the animals was one of the costliest things to learn and overcome. Even those longest in the business have attempted little by way of taming the creatures. A ranchman may have one or two pets that will eat from his hand and allow themselves to be fondled like a dog, but generally their natural habits are respected.

During the mating and breeding season, from December to May, the pens are guarded with the most absolute strictness. No one but the keeper is allowed to approach them. The slightest intrusion upon their privacy by man or beast is apt to result in the effort of the parents to hide their young. The mother, if excited by any means, will bury her young in the ground, or carry them about in her mouth until they are smothered or worried to death. The male is usually withdrawn from the pen before the little ones arrive. Many have been lost thru the ignorance or disregard of the peculiar nervousness of the female. During this delicate period such care must be taken that it is perilous for the keeper so much as to change his coat when visiting the pen. New laws have been passed by the Provincial Parliaments relative to the

business and trespassing is punished with terrific penalties.

In the early days of the industry not a few foxes were lost by burrowing or climbing out. The cunning little brutes have been known to burrow under a fence sunk six feet into the ground, and they have climbed over a fence ten feet high. In the most approved ranches a pen for a pair is an enclosure about 50 feet square, with a fence of stout woven wire, buried from two to six feet into the ground, and turned in at the bottom twelve or fifteen inches, and rising ten feet above ground with an overhang of three feet. The wilder and more retired the location of the ranch, the less inclined are the foxes to try to escape.

Questions arise. Whereunto is this industry likely to grow and what effect will the increased supply have upon the price? For the present and for several years yet, the supply of pelts will be rather diminished than increased. The demand for live animals for breeding purposes is so great that only those that have passed the age of fertility, about a dozen years, will be killed for their pelts. Ultimately, of course, that number must greatly increase. But it has been calculated that even if the price of the pelts were reduced to a tenth of the present value, the industry would still be a very profitable one.

There are two other facts that must be noted: First, that fox-fur, red or silver, from Prince Edward Island and the other Maritime Provinces, is superior to that of any other country in the world; and, second, the fur of the domesticated animal is superior to that of the captured wild animal, chiefly because of the scientific breeding and because the fur is not exposed to the wear and tear of wild life.

Another question is, what effect will this sudden influx of wealth have upon a quiet, industrious rural community? That indeed is another question. It would be difficult to find a near parallel. There will be no sudden great increase in the population. No considerable importation of labor. The largest ranch may occupy all of one man's time, but a trifling amount of his labor. There will be no scrambling multitudes like those of the oil or gold fields. Only such labor will be attracted as is required by the much more luxurious life of the ranchmen. Already splendid residences have arisen to take the place of the humble farmhouse and the dust-cloud and demonical squawk of the automobile disturb the primitive quiet where erst the bleeting of sheep, the mooing of cows, the cackling of hens and other bucolic sounds were heard.

Meanwhile these provincial farmers have learned and taught a lesson in conservation. They have mastered to a degree one of the most difficult problems of domestication. One wonders it was not accomplished long ago, and undoubtedly, as the product of the hunter and trapper diminishes, we shall hear of the domestication of the mink, marten, beaver, otter and other fur-bearing animals in those latitudes respectively best suited to the business.

Newark, N. J.

The Red Dawn

By Clinton Scollard

TODAY I watched the wonder of the dawn
Flush out of pearl and fawn,
Crimson the dew,
And make night's close
Irradiant with rose.
The awakened soul divines,
Thru colors and thru lines,
That heavenly beauty shines;
Beauty, by night withdrawn,
Flowers with the glowing dawn,
Flowers—and is gone
But ever flowers anew!

Clinton, N. Y.

Bury the Big Stick

By General Cipriano Castro

[The ex-President of Venezuela courteously received the representative of THE INDEPENDENT in his apartment at the Hotel Savoy, and replied to his questions with much animation in fluent Spanish. Senor Alfredo Torregrossa, the General's courier and secretary, acted as interpreter for the following interview. The General wore a flowered smoking cap and carpet slippers. His manner was bright and genial, as if he is at last beginning to enjoy himself here, now that he is released on bail from the "custody of the United States immigration authorities" on Ellis Island.—EDITOR.]

I do not blame the people of the United States for the treatment to which I have been subjected by the officials at this port. I know many citizens of this country who are good men. Those who are persecuting me misrepresent the great United States and are doing it more injury than they can well understand.

All over South America men are watching to see how I am treated. They note the false pretexts that have been raised against me, and according as I receive justice or injustice they will judge the Government here as just or unjust.

GENERAL CIPRIANO CASTRO TO-DAY

Perhaps there are some who think that it makes little difference to this country what men in South America may think of it, but such persons are not wise. The nations of the future are there. Brazil and Argentina, for instance, are advancing very fast. They are on the way to become great, tho not yet so great and strong as the United States.

The firm friendship of South America is the very best guarantee which the United States can have for the maintenance of the Monroe Doctrine, and that friendship is easy to secure. Let the Big Stick be buried—it does nothing but harm. Let the United States meet South America half way in amity and brotherhood. Let there be justice and equity between North and South. All Americans from Patagonia to Greenland should be linked together in the bonds of friendship; should act together for their mutual interests. They should present a united front to the rest of the world. Then there would be no cause for fearing that any of the great nations of the Old World will quietly build up a power in the southern continent that can in the future be used to destroy American liberty.

While I was president of Venezuela I appreciated the greatness and strength of the United States, and I sought by all means at my command to increase the good understanding between this country, my own, and the other States of South America. That I did not succeed was due to certain sinister influences which will be disclosed if examination is made of the records of the United States legation at Caracas.

When the claims of the European nations against Venezuela had been presented and the blockade had been declared by Great Britain, Germany and Italy, the United States Government intervened thru its Minister, Herbert W. Bowen. The issues were taken to Washington, where Mr.

Bowen signed, in the name of Venezuela and the United States, protocols in which the issues were to be submitted to arbitrators who were to meet in Caracas.

The arbitrators passed upon all points, including claims of American citizens and companies, but later—when the Venezuelan Government was faithfully and strictly carrying out the findings of the commission—the United States Government intervened again to prevent compliance with the decisions by American companies—the Bermudez, the Manoa, the Griffel, and the Orinoco companies.

I insisted that the arrangement made by Mr. Bowen be carried out, but the reply of the United States Government was the breaking off of diplomatic relations and the withdrawal of its Minister. Afterwards it supported Gomez, who betrayed me and Venezuela, and still later it gave to the world the spectacle of one of the greatest of nations hunting me—a private citizen. Had I not been lying ill at Teneriffe I might have been seized and condemned as a pirate, because I endeavored to reach Venezuela in order to rescue it and my own private property from a robber.

I say now that there will be found in the archives of the legation at Caracas the following:

First—The protocol signed by Mr. Bowen with every nation and with the representative of the United States Government.

Second—The notes communicated to me by the United States Government and my replies.

Third—Documents relating to the withdrawal of the United States Minister to Venezuela and the rupture of relations between Venezuela and this country.

Fourth—Documents proving the United States Government's pursuit of me since five years ago when it hunted me with its armored cruisers.

Fifth—Documents showing how, since my term as president of Venezuela, arrangements have been made with Gomez breaking the agreement entered into in the diplomatic protocols.

Under the circumstances, the world will hardly blame those who believe that the Government of this country has acted toward me with petty spite, utterly unworthy of its dignity. Apparently it has allowed itself to be used as a tool by corporations which I was obliged to antagonize while performing my duty as the defender of Venezuelan rights.

All that I and all that South America desire from this country is simple justice. In regard to the dispute between this country and Colombia concerning the independence of Panama, I do not know whether the United States did right or wrong—I have not the facts.

No matter what the courts here may do, I probably will stay in this country but a little while. Then I will go to Europe. I do not know where I will reside in the future. There are many things to be considered.

Perhaps I will go to Spain. That is the country from which long ago my forefathers came. Spain is being made over. One can find the new Spain and the old Spain side by side and both are interesting. So perhaps I will go to Spain.

As to these telegraphic dispatches from various points announcing that my purpose is to stir up revolt in Venezuela and recover the Government there, I have but one word with which to describe them. They are lies.

New York City.

THE GUARD: "Watch your step, Governor!"

[The problems of the New York City Subways, and of the Public Service Commission, have given Governor Sulzer more worry than anything else.—*A Newspaper.*]

THE NEW BOOKS

From a Scholar's Workshop

Of Emerson's *Uncollected Writings*, little need be said.[1] It contains nothing that is new, and very little of the least value in estimating the man Emerson or arriving at a true understanding of his work. Doubtless every article, address, poem, lecture, was under the eyes of the various editors authorized by the poet's family. Most of the matter is inferior, or ephemeral, or elsewhere worked over to better advantage.

This is not true of the Emerson *Journals*, of which eight volumes are now before the world.[2] In these volumes the editing is painstaking, modest, nowhere a sitting in judgment, always aiming for the elucidation of the published writings,—connecting, so to speak, the Emerson in his study, groping for facts, polishing one facet or another of the gem that was to take the light, with the Emerson known to the public. Much light is thrown upon his methods of reasoning, of which he claimed to have none. Unmethodical, was his judgment of himself. Discordant, was the universal cry of the schools. But his approaches to a method of his own, as shown in the *Journals*, are everywhere apparent, when the workings of his mind are considered. The journals were his workshop. There one sees him at his luminous moments. He talks more freely there, to himself. He is frank about himself. He cannot go over his borders, he repeatedly says in his *Journal*. His limits are fixed. But so are other people's limits. "The fault of Alcott's Community is that it has only room for one," he says. Everett, made president of Harvard, gets sweet praise for his perfection of finish—the perfect gentleman—but he is most severely handled for senatorial deficiencies. "Old Quincy," former head of the College, "with all his worth and a sort of violent service he did for the college, was a lubber and a grenadier among our clerks." Of Rufus Choate, who possessed the most liquid eloquence of any man in his time, the poet writes:

> He is a locomotive that runs so readily back and forward that there is perpetual need to scotch the wheels. A man full grown should not cry in a public place alone.

Of his pastoral neighbor, whom he admired and loved, he saw the limitation sharply:—"Alcott is a pail of which the bottom is taken out, and the Whig a pail from which you cannot get off the cover."

Emerson had his aversions and talks frankly about them."Democracy becomes a government of bullies tempered by editors. The editors standing in the privilege of being last devoured." Again, "I avoid those Stygian anniversaries at Cambridge, those hurrahs among the ghosts, those yellow, bald, toothless meetings in memory of red cheeks, black hair, and departed health." In these days he would be called "anemic." But his diary is full of intense desire to get at people, to meet the trader, the farmer, the lawyer, doctor, etc., with open mouth as well as open heart. He couldn't do it, he often said, and the why is perhaps evident in another entry in his *Journal*:—"In the water party, the skipper of the boat was the only interesting person; the rest made puns." Intellectually he was half an aristocrat. He wanted the best to gov-

[1] *Uncollected Writings*. By Ralph Waldo Emerson. New York: The Lamb Publishing Co.

[2] *The Journals of Ralph Waldo Emerson*. Vols. VII and VIII. Edited by Edward W. Emerson and Waldo Emerson Forbes. Boston: Houghton Mifflin Co. $1.75 each.

ern, but then he had his own definition of aristocracy, which led him to walk to the polls with his uneducated, undescended neighbor with quite as much satisfaction as with Judge Shaw. He wanted "freedom, equality, fraternity," but then he couldn't fraternize himself in every case. "I confess I lose all respect for this tedious denouncing of the State by idlers who rot in indolence, selfishness, and envy in the chimney corner." He demanded much for the poet. Thus:—"The etiquette of society should guard and consecrate the poet; he should not be visited nor be shown at dinner parties; too costly to be seen except on high holidays." But one soon finds that his kind of poet comes "only once in five hundred years." No place for boys! And he expected much of the poet—more than any self-respecting poet will give him. Thus, "The Muse demands real sacrifices. You cannot be a poet and a paterfamilias and a militia captain," whereas we know that most of our poets are made by the dear little mother at their elbow.

In the years at which the *Journals* have now brought us, the callowness of the young journalist has disappeared. His first thought is compressed, pointed, choice. He has acquired a mastery of the polishing tools. The divinity student in him has given way to the philosophic observer. He has ransacked history for his material. Now he is making some of its best things over. He renders unto Cæsar the things that are Cæsar's more gracefully, and smiles at Thoreau, who goes to jail rather than pay his taxes. After all they are local taxes, not national, he says. When Mr. Alcott refuses to pay taxes anyhow, he quotes with unction a word from his neighbor, Staples:—"I vum! I believe it was nothing but principle." He has a traditional line of humor that has come down from pulpit days and he lays in material for small entertainment in abundance. Said William Emerson of Judge Story:—"He had two failings as a judge: first, in p'int of judgment; and second, in p'int of integrity; you take my idea?" This serves to explain that shrewd, benignant smile, so constant in the Emerson portraits. The smile had gone with him from the beginning, had hovered over the inexplicable communion service in his pulpit days; had been with him in Rome on the Capitoline Hill, where the bambino was displayed once a year, with a chorus of shaven priests in the background. It had twinkled a little as he sat with the dons at the Harvard inaugurations. It had beamed on the Brook Farmers, as he watched those heavenly boys and girls and simple-hearted old men digging roots in Paradise. It was a smile that explained Emerson in his own terms. It marked the interested onlooker who had segregated himself, but looked over the fence. It said: "Your pasture is not my pasture, but how interesting you can make yours, to yourselves! I do not altogether like a too plain table like Thoreau's at Walden Wood. I have no facility at digging roots. I see a beautiful symbol in the bambino, but the tonsure is not natural." Moreover, he was growing impatient with those who limited the freedom of speech by granting copyright for phrases, maxims, pithy condensations of thought. The pasture was as free to him as was the berry pasture to the New England boy. He could hang his pail under any blueberry bush. He was willing to name the pasture and date the berry, but a phrase was his if he could make a better use of it than had its inventor. Indeed, if he could add a beauty of polish to it, he was entitled to a new patent. Every word in the dictionary was stamped with the name of its first user, if you would only hunt up the history of it, but any man who should add a new shade of beauty to a word was entitled to credit as a contributor to the language. So of a shining thought; if he made it shine more, it might after all be an imposition on Zoroaster or Dean Swift to say it was the coinage of either of those gentlemen. "I will

shoulder the thought. I need it. They shall not be blamed for it."

The volumes now under review take us to the year 1855, and are rich in his best things,—all chips in a scholar's workshop.

Eucken and Bergson

The little volume by Mrs. E. Hermann on *Eucken and Bergson*[3] is especially timely, and will find many readers now when both the German and the French philosophers are in this country, the former lecturing at Harvard and the latter at Columbia. Mrs. Hermann gives a fair and readable presentation of the doctrines of the two great thinkers, and then considers them from the point of view of orthodox Christianity. She welcomes both as having contributed toward the elevation of philosophy from the stage of materialism to a higher and more spiritual plane, but finds each of them fall short in some respects of her standard of Christian doctrine.

But what has interested us most in the volume is not the theological views of the book, but the curious similarity which certain parts of it bear to an article publisht in THE INDEPENDENT more than a year before. The coincidence is all the more interesting since it does not appear that the pious authoress ever read THE INDEPENDENT article, for no reference is made to it in the bibliography at the end or elsewhere. The following quotations will show that the similarity in language extends even to the footnotes, altho in the spelling of the proper names Mrs. Hermann displays some originality.

From the article on Henri Bergson by Edwin E. Slosson, publisht in THE INDEPENDENT, *June 8, 1911.*

His lecture room is the largest in the Collège de France, but it is too small to accommodate the crowd which would hear him. A cosmopolitan crowd it is that on Wednesdays awaits the lecturer, talking more languages than have ordinarily been heard in the same room at any time during the period from the strike on the Tower of Babel to the universal adoption of Esperanto. French, Italian, English, American, German, Yiddish and Russian are to be distinguished among them; perhaps the last predominates among the foreign tongues, for young people of both sexes come from Russia in swarms to put themselves under his instruction. This may rouse in us some speculation, even apprehension. Bergsonianism has already assumed some curious forms in the minds of his over-ardent disciples, and what it will become after it has been translated into the Russian language and temperament it would be rash to prophesy. But the polyglot audience is silent * * *

That this danger is real and present was shown in the Binet report on the teaching of philosophy, previously referred to. Some of the professors complained that their students, under the influence of Bergson's ideas, had come to have a disdain for the tedious and laborious methods of experimental science, believing that science does not give us reality, and assuming that, while science is good enough for mechanics and physicians, it is indifferent to philosophers.

When this point was brought up for discussion in the *Société française de Philosophie,* M. Bergson made an indignant reply, declaring that in the theories attributed to him he recognized nothing that he had taught or written.

In France, Bergsonianism is not an academic speculation, but an active force in some of the most important movements of the day. We hear of a Bergsonian art and a Bergsonian literature as well as a Bergsonian Catholicism and a Bergsonian labor movement. * * * Just as there were Hegelians of the Right and Hegelians of the Left, so now there are two wings of Bergsonianism, the conservative being the Modernists and the radical being the Syndicalists.

There has rarely been seen such an outburst of enthusiasm for metaphysical thought as that of the French neo-Catholics. Between 1902 and 1903 eleven new reviews devoted to Catholic philosophy and theology were founded. The pragmatic philosophy, particularly James's *Varieties of Religious Experience,* pointed the way to a new Christian apologetic based upon living experience, instead of abstract reasoning. The young Catholics turned their attention to the saints rather than to the theologians, and found inspiration in a fresh study of the Catholic mystics. In a conception of truth as a growth, as an ideal

[3] *Eucken and Bergson:* Their Significance for Christian Thought. By E. Hermann. London: James Clarke & Co. Boston: Pilgrim Press. $1.

convergence of beneficial beliefs, rather than as a static limit, and in a conception of history as a progressive process of verification, they attained a point of view which enabled them to retain their ecclesiastical heritage and at the same time to accept thebounty of modern science. But such speculations were deemed dangerous by the Vatican and the movement was crushed, so far as a movement of such vigor and vitality can be crushed, by the Encyclical and Syllabus issued by Pius X in 1907, and the anti-modernist oath that was later imposed.[4]

At the opposite extreme we find the trades unions or syndicates, whose power has been often demonstrated in recent years, but whose aims and ideals are yet indeterminate and vague. So far it is Will and not Idea that is manifested in the revolutionary labor movement, to use the Schopenhaurian terms. But becoming conscious of the need of a philosophical justification, they have seized upon one side of Bergson's doctrine and declared the *élan ouvrier* brother to the *élan vital*, or part of it. Their flamboyant phraseology reminds one of 1793: "The Collège de France collaborates with the Bourse du Travail" and "The flute of personal meditation harmonizes with the trumpets of the social revolution." The syndicalists, like the modernists, have their revolt against dogma, against the catchwords of republicanism as well as against the rigid formulas of Marxianism, against all attempts to confine the future in the past and to impose determinism upon conduct. And when it comes to the enforcement of conformity—or, rather, of uniformity—of profession, there is not much difference between Pope and party.[5]

It is unnecessary to say that M. Bergson teaches neither Catholicism nor revolution, and that he cannot be held responsible for all the various applications of his ideas to practical life. I mention these extremes only to show the range of their actual influence. Whatever may be the fate of Bergson's philosophy, we may be sure it will not leave the world as it found it.

Very few references to disputed questions in religion, sociology and ethics can be found in his works, and since he prefers to use a new, clean and unconventional vocabulary, he cannot be pocketed in any of the pigeonholes provided in advance by the historians of philosophy. To the demand for a brief formulation of his philosophy an indignant Bergsonian retorts: "Can you put Maeterlinck's *Pelléas and Mélisande* into a formula?"

From the book Eucken and Bergson *by E. Hermann, publisht in the fall of 1912.*

His is the largest lecture room the college can boast, but not nearly large enough to accommodate the polyglot crowd of both sexes that gathers every Wednesday. Of late Russian has predominated among foreign tongues, and one so minded could frame some neat speculations as to what bizarre and exotic form Bergsonism seen through the Russian temperament is likely to take.

Already it has assumed a variety of interesting, not to say alarming, forms in the minds of over-ardent disciples in France and elsewhere, as, for instance, the Binet report on the teaching of philosophy at the French *lycée* testifies. This report arose out of a not unjustified sense of the danger of the anti-intellectualist movement to the cause of scientific research, some of the professors complaining that their students, under the influence of Bergson's ideas, had come to have a disdain for the slow and laborious methods of experimental science, believing that while science was all very well for mechanics and physicians, it did not give us reality, and therefore was of no importance to philosophers. When this point was brought up for discussion before the *Société Française de Philosophie*, Bergson made a spirited and convincing reply, showing that the theories attributed to him by these complainants bore no resemblance to anything he had ever taught or written.

Bergsonism in France has long overflowed academical boundaries. There we have not only a Bergsonian philosophy, but a Bergsonian art and a Bergsonian literature; and, more important still, a Bergsonian Catholicism and a Bergsonian Labour Movement. Not unlike the Hegelian camp, Bergsonism has sp'it up into a right and a left wing, the former being represented by the Neo-Catholics and the latter by the Syndicalists.

On the Catholic side, the influence of Bergson's ideas, strongly reinforced by James's pragmatic philosophy, in particular his *Varieties of Religious Experience*, gave rise to no less than eleven new re-

[4]Articles on Pragmatic Catholicism may be found in almost any volume of the *Revue Philosophique* and the *Revue de Métaphysique et de Morale* during the last twelve years. See especially those by Edouard Le Roy, a devoted disciple of James and Bergson. A brief account of the movement is contained in Lalande's "Philosophy in France, 1907." *Philosophical Review*, May, 1908.

[5]As representatives of the pragmatic syndicalists may be mentioned George Sorel and Edouard Berth. For an account of the philosophical side of the movement see *Syndicalistes et Bergsoniens* by C. Bouglé in *Revue du Mois*, April, 1909.

views of Catholic philosophy and theology within one year. The main stimulus was in the direction of a fresh study of the saints and mystics, and one might note in passing that it is precisely the lack of such study that makes the new German idealism fall short of affording complete satisfaction when it becomes a philosophy of religion. On the more strictly speculative side, the Neo-Catholics adopted a pragmatic view of truth as a growth rather than as a static limit, and of history as a process of progressive verification, holding that view in a sense which enabled them to encompass what must remain unintelligible to the Protestant mind—loyalty to their ecclesiastical heritage and generous hospitality to the new science and the new philosophy. The Vatican, however, did not regard this view as quite "safe," and made a not unsuccessful attempt to crush it in the Encyclical and Syllabus of 1907.[6] . . .

Poles asunder from New-Catholicism, we find the Syndicalist movement also claiming Bergson as its intellectual bond and inspiration. Until lately this movement has been but a vague and turbulent mass of yeasting impulse and passion, beating indeterminately against every institution and privilege, and propelled by blind will rather than carried by a dominating idea. Casting about them for some intellectual basis and justification which would give momentum and direction to their efforts, the leaders[7] of the movement seized upon Bergson's idea of the *élan vital* as twin of their *élan ouvrier*, or at least as including it. At one with the modernists in revolting against dogma, tradition and inflexible formulae, they hailed Bergson as their ally with a flourish of trumpets. "The Collège de France collaborates with the Bourse du Travail," they shouted with a flaunting assurance that smacks of 1789: "The flute of personal meditation harmonises with the trumpets of the social revolution." It must be remembered that Bergson offers no closed system. Like the reality he bids us enter into, it is still in flux; like his own *élan vital* it cannot be packed into a formula. When asked for the Bergsonian philosophy in a nutshell, a hot-headed disciple retorts, "Can you put Maeterlinck's 'Pelleas and Melisande' into a formula?" (Pp. 130-134).

[6]Articles on Pragmatic Catholicism may be found in almost any volume of the *Revue Philosophique* and the *Revue de Métaphysique et de Morale* during the last twelve years. Those by Edouard de Roy, an enthusiastic disciple of James and Bergson, are specially noteworthy.

[7]George Sorrell and Edouard Verth may be mentioned as leaders of the Pragmatic Syndicalists. An excellent account of the philosophical side of the movement is given by C. Bouglé under the title of *"Syndicalistes et Bergsoniens"* in the *Revue du Mois*, April, 1909.

Literary Notes

As a companion volume to *Bible Types of Modern Men*, Rev. W. M. Mackay has published a series of Sunday evening addresses, entitled *The Woman of Tact, and Other Bible Types of Modern Women* (Doran, $1.50). The sermons are all interesting in their expositions and parallels, but the title of the first is unhappily chosen.

The eight and ninth volumes of the monumental Cambridge History of English Literature, edited by Dr. A. W. Ward and Mr. A. R. Waller, are entitled, respectively, *The Age of Dryden* (Pp. 576) and *From Steele and Addison to Pope and Swift.* (Pp. 666.) The American publishers are Messrs. G. P. Putnam's Sons, and the price of each octavo volume is $2.50.

An important contribution to the *Age of Dryden* is Mr. H. B. Wheatley's Dryden bibliography. The same scholar signs a portion of the chapter on Memoir and Letter Writers. Samuel Butler, Political and Ecclesiastical Satire, the Early Quakers, Court Poets, The Prosody of the seventeenth century, Platonists and Latitudinarians, Divines, John Locke, The Progress of Science, The Essay, The Beginnings of Modern English Prose: these are some of the other chapter headings. Restoration drama is divided between three nistorians: Charles Whibley, A. T. Bartholomew, and Dr. Schelling of the University of Pennsylvania. Another American, Professor Trent of Columbia, signs the opening chapter in the following volume, The Newspaper and the Novel; while a woman, Dr. Caroline F. E. Spurgeon, contributes the study of William Law and the Mystics.

Frank Roy Fraprie, in *The Raphael Book* (L. C. Page, $2.50), gives "an account of the life of Raphael Santi of Urbino and his place in the development of art, together with a description of his paintings and frescoes." The author realizes that his subject is less attractive than once to such as have set their eyes upon contemporary efforts in art, and writes somewhat petulantly that he has "no hope" of interesting "the little painters of today" and their admirers, "the seekers of phantasms"; but his enthusiasm is unaffected by the coldness of the unregenerate modernist. Illustrations, a bibliography, etc., swell the work to more than 350 pages.

What the Other Children Do, by Elizabeth Grierson (Macmillan, $1.25), sketches for children the lives of the "other children," in the sugar-coated sociological form of a story, told by one of two little Scotch lasses of high degree who spend a vacation at their aunt's settlement in Belchester, and learn more than in a year at school.

The announcement that the President and Fellows of Harvard College have voted to establish the Harvard University Press for the publication of works of a scholarly character recalls the fact that the first printing press in America was a gift to Harvard College, made in 1639, and was set up in the house of President Dunster. Among important books printed on this press were the *Bay Psalm Book* and *John Eliot's Indian Bible.*

In our issue of Nov. 14, 1912, we publisht an abstract by Prof. E. C. Moore, of Yale, of his report on the New York city schools made by authority of the Board of Estimate, but rejected by that body. (See also THE INDEPENDENT of Nov. 21, Dec. 12, 1912, and Jan. 23, 1913). The Moore report is now to be publisht in full by the World Book Company, Yonkers-on-Hudson, N. Y. ($1.50) under the title *How New York City Administrates Its Schools,* with an introduction by Professor Hanus, of Harvard.

Mr. Isaac Landman in his *Stories of the Prophets* (Cincinnati: Union of Am. Hebrew Congregations; 75 cents) has supplied an intimate personal and social background for the work and messages of the Hebrew prophetic writers who lived before tne exile. His spirited pictures of family, social and political happenings are largely imaginary creations, but they are made on the basis of biblical hints and are in accord with the historical conditions. The book will materially aid young readers to find reality in the stern and difficult writings of the prophets.

Admission to American Trade Unions, by Dr. F. E. Wolfe (Baltimore: The Johns Hopkins Press), is a comprehensive study of the laws laid down by trade unions to regulate admission to their respective organizations. The book is a painstaking compilation of facts, chiefly drawn from official trade union documents. The author has almost entirely refrained from comment on the propriety or justice of the rules adopted. That trade unions in practice are and in ultimate aim must be inclusive in their admission policy is shown by an historical narrative of their attitude toward women, aliens and negroes. Beginning in each case with severely restrictive or absolutely exclusive regulations, motives of expediency have gradually compelled the adoption of the "open door."

It would be hard to imagine a better book for the purpose than Dr. A. F. Blakeslee and Chester D. Jarvis's illustrated *Trees in Winter: Their Study, Planting, Care and Identification* (Macmillan, $2.). The authors are, one a professional botanist, the other horticulturist in the Connecticut Experiment Station. The arrangement of the material is most convenient, the practical information valuable for tree-lovers and students alike. This is a book for the owner of an acre as well as for the master of a large estate.

Two noticeable characteristics of recent hymnals appear to good advantage in the *Songs of the Christian Life* (Merrill, $1.25), edited by Dr. Charles H. Richards. These are the modest number of hymns (less than six hundred), and tunes, in the collection, and the inclusion of many selections imbued with the spirit of brotherhood and social aspiration. Several of these new hymns by such writers as Henry Van Dyke, W. N. Clarke, Felix Adler and F. M. North are worthy to stand beside the old favorites of Dr. Gladden and J. Addington Symonds. The general makeup of the volume is worthy of commendation.

Whether the subjects are chosen for their beauty or their frailties or for the sake of their charming portraits, the stories of *Lady Hamilton* (by E. Hallam Moorhouse), *Nell Gwyn* (by Cecil Chesterton), and *Marie Antoinette* (by Francis Bickley) make pleasant reading (Small, Maynard & Co.). We are involved in none of the historical controversy which complicates many more pretentious biographies; we are delightfully introduced and included in the kindly circle of their admirers. Two at least of these volumes, Mr. Chesterton's and Mr. Bickley's, give a vivid picture of the social setting which was somewhat responsible for the ladies' characters. Mr. Moorhouse is perhaps too much under the fascination of Lady Hamilton's extraordinary career. The books themselves are dainty, pleasant-to-hold little volumes, embellished by many reproductions (some in color) from famous portraits.

We have not kept up with the *Oxford English Dictionary* of late, and four fascicles, all the way from *See* to *Several*, and again from *Th—* to *Tombac*, lie piled upon our desk. This "English Dictionary on Historical Principles" serves as a constant reminder of the debt which our "Americanisms" owe to the good old mother tongue. Mr. Philip Hale calls our attention to the phrase, "to have a good time," that is no oddity of our cross-Atlantic speech, but was common in England from 1520 or thereabouts to about 1688. Alehouse Skelton wrote: "For to haue good tyme and to lyue meryly," and that was in 1529.

"On time" is, however, classed as a pure Americanism by Dr. Murray and his editors. Turning to Mr. Thornton's *American Glossary*, reviewed in THE INDEPENDENT for January 16, we light upon an example of this phrase's use in 1848 ("Spose you never heard of burying a man *on time*." —*Stray Subjects.)* Undoubtedly good Yankees were "on time" long before 1848.

The Englishman of today smiles when he hears us boast of voting the Progressive or Democratic "ticket"—but that was good Pennsylvania English in 1711. We read in the *Dictionary* this quotation from the Penn-Logan correspondence: "Chester [Pa.] carried their ticket entire." In 1766 Sarah Franklin wrote to Benjamin: "The old ticket forever! We have it by 24 votes." These are earlier examples than Mr. Thornton has found for his *American Glossary*. In 1842 the Philadelphia *Spirit of the Times* exhorted: "Don't split your ticket!" Five years later the *Knickerbocker Magazine* praises a patriot in these terms: "He never scratched the regular ticket." (These gems from Mr. Thornton's work.) The Americanisms ticket broker, ticket chopper and the verb, "to ticket," meaning to issue tickets, are not to be found in the Philadelphia lawyer's *Glossary*, but occupy the proper space in the *Oxford Dictionary*. And did you know that a ticket meant a visiting-card in the seventeenth century, whether in England or the Colonies? We have heard an Irish servant-girl use the word so: "Here's his ticket, sor." It is so used, too, in Thackeray's *Philip*. Wholly abominable is the use of the word "transportation" for "railway tickets"—an Americanism dignified by employment in the new Grand Central station in New York.

Four lectures delivered before collegiate audiences in England by a professor of the University of Paris, M. Emile Legouis, are brought together in the volume entitled *Défense de la Poésie Française a l'usage des lecteurs anglais* (London: Constable.) The old view that French poetry cannot repay study or induce enjoyment was founded upon the assumption that the nation which produced that poetry was incapable of high emotion, and was committed to the use of a tongue suited to nothing but (in the lecturer's words) "a certain elegant, agile, clear, and well-ordered prose." Various causes have contributed to modify this view; the Anglo-American public has been educated and charmed by such volumes as the *Oxford Book of French Verse*, the *Lyre Français*, Mr. Bailey's book, Mr. George Wyndham's, and Mr. Eccles's. Yet M. Legouis does well to issue his *Défense*. The prejudice still exists. And M. Legouis himself, being a professor of English literature in his own land, has too fine an appreciation of the art he celebrates to pretend that his countrymen do, in point of fact, attain those hights of lyrical beauty and dramatic daring that mark the English achievement.

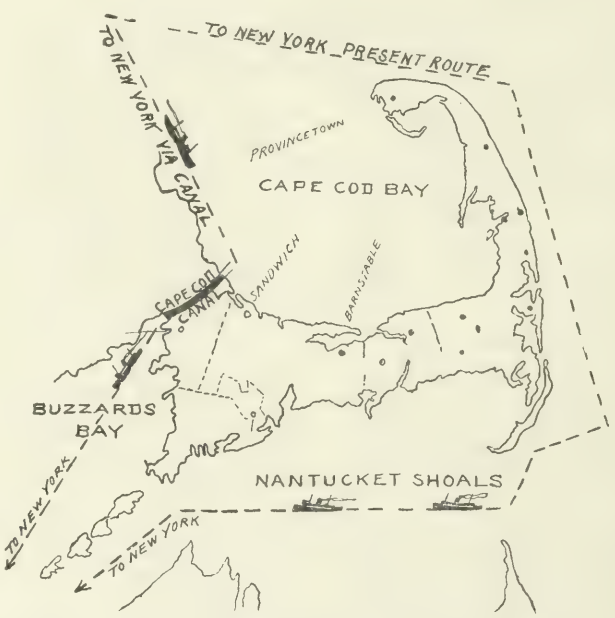
If the duality of the English vocabulary has its poetical advantages, the unity of the French is, according to M. Legouis, a compensating virtue. Said Dryden: "Impartially speaking, the French are as much better critics than the English, as they are worse poets." But Dryden didn't want too many persons to turn toward France, where he had stolen his dramatic plots along with his critical ideas; and Dryden wrote, besides, before the *entente* in an age when Englishmen habitually proved their patriotism by running down their next-coast neighbors. Of the French apologist's four chapters, three deal with *scops et trouvères*, the *grand siècle*, and *nos jours*. If English poesy is a splendid structure, it is builded upon French medieval literature as a foundation, he reminds us. But it is French classical verse which has left us cold, and so the chapter dealing with this subject is the one which most deserves attention. Professor Legouis's commentary upon the alexandrine should be required reading in our school and college courses in French literature. It may lack fire, but is strong in sense, and corrects some of the ignorant aspersions of Landor, Lowell, and other critics. This is a welcome little book, but it would have more dynamic force in English translation than in its present form. Why does not Professor Legouis, having just completed a course of lectures at Harvard, translate it for the Harvard University Press whose foundation we chronicle?

SURVEY of the WORLD

The Japanese Cabinet

Our nearest neighbor across the Pacific, Japan, is just now in the throes of a bloodless revolution, attempting to develop a government which shall be truly responsible to the popular will as represented in its Diet or Congress. The difficulty comes from the fact that the age of enlightenment in Japan began with an Emperor to whose person and family there was given a fictitious reverence which involved the reality of power in the hands of the Cabinet appointed by him, but who were considered and spoken of as mouthpieces of his august will. During the nine months in the year when the Diet was not in session the Emperor, that is, the Cabinet, could issue decrees which had the force of laws, which the Diet could constitutionally annul, but which in fact it never did annul. A little company of Elder Statesmen, called the Genro, had immediate access to the Emperor, and were his advisers even closer than his Cabinet; and these Elder Statesmen have had a predom'nating influence in the House of Peers, corresponding to the House of Lords in the British Parliament. In Great Britain the veto power of the House of Lords has been overthrown, but this is not the case with the Japanese House of Peers. Nor has the power of the more popular house of the Diet yet so far developed that an adverse vote can compel the resignation of the Cabinet Rather, the life of the Cabinet depends on its harmony with the will of the Elder Statesmen

It is the popular resistance to the authority of the bureaurocracy, particularly of the conservative Elder Statesmen, which explains the present crisis in Japan. The Cabinet headed by Saionji had the confidence of the Diet. By his tact he had won the support even of the House of Peers, tho not of the Elder Statesmen. It was his policy, considering the burden of taxation, to reduce expenditures, contract no present loans, and to reduce the cost of the Navy by postponing the building of additional ships of war. Supported by the Elder Statesmen, particularly its leader, Yamagata, the Secretary of the Navy refused to assent to this policy of retrenchment and resigned. The power of the Genro was then sufficient to compel the resignation of Saionji and his entire Cabinet. There was difficulty in securing a successor, but Yamagata and his associates in the Genro finally advised the Emperor to command Katsura, one of their own number, yet not in full sympathy with their desire, to be the head of the new Cabinet. He had twice before been Premier, and his record did not please the parties in opposition to the new Cabinet. Nevertheless Katsura proclaimed a policy much the same as that of Saionji, but that did not appease the opposition. What they wanted was to break down the bureauroracy of the Genro, and they seem to have succeeded. Even Katsura declared that its power was ended for all time.



The Diet was prorogued, on the announcement of the new Cabinet, until Wednesday of last week. Meanwhile there was organized a strong campaign against bureaurocracy all over the empire. The two principal Constitutionalist progressive parties formed a coalition and agreed on a policy of immediate opposition to the new Cabinet, and threatened a vote of want of confidence as soon as the Diet should meet. Katsura declared that in such a case he would ask the Emperor to dissolve the Diet. On Wednesday the Diet met, and on the same day past a vote of censure. Katsura wasted not an hour, and the Emperor suspended the Diet for five days. A dissolution and new election will almost certainly follow.

But the members of the Diet did not separate peacefully. The scene of dispersal was such as had no parallel. There was an enormous crowd who cheered the Constitutionalists and assaulted the leaders of the party supporting the Government. They were thrown out of their jinrikishas, and narrowly escaped a ducking. The Constitutional party is determined and has the country behind it, and is led by the Mayor of Tokio. It is probable that the power of the Elder Statesmen is gone, and popular rule, with the responsibility of the Cabinet to the Diet, with the maintenance of the Constitution, is assured. It is a step in advance toward the condition of government that prevails in Great Britain, rather than that which persists in Germany.

The Cape Cod Canal

The Panama Canal is not the only canal now being rushed to completion by American engineers for the purpose of shortening deep water voyages for American steamships. The Cape Cod Canal is now about half finished and it should be a nip and tuck race between the two as to which will be opened for commerce first.

As early as 1627, when Miles Standish traded at Monamet with the Dutch, a canal was contemplated to sever Cape Cod from the Massachusetts mainland. In 1776 General Washington ordered a survey made for such a canal which would "give greater security to navigation and against the enemy." Then a series of attempts, both by the State and private organizations, were begun to start the project, but it was not until after the elaborate surveys made by the government and the State of Massachusetts in 1860 that anything practical was done. Tho several companies were organized with every prospect of successfully compassing the work, they all failed for one reason or another until in 1904 Mr. August Belmont and associates became interested. They took over the Boston, Cape Cod & New York Canal Co. chartered by Massachusetts in 1899 and began excavating on June 22, 1909.

WHAT THE CANAL WILL SAVE IN NAVIGATION

Cape Cod, as every schoolboy is supposed to know, is a fish hook of land projecting 30 miles east of Massachusetts into the Atlantic Ocean and inclosing Cape Cod Bay. The bay, tho protected by capes on the South and East, is open to the North, and as most of the winter winds come from that direction, it is a very dangerous region —especially for sailing boats and barges. Every year many are driven on the shore and wrecked. During the past 5 years there has been an average of 35 ship disasters, 15 total wrecks and 12 lives lost per annum.

Outside the Cape are dangerous shoals, which, together with the frequent rough and foggy weather, make this part of the coast exceedingly hazardous in all but the summer months.

South of Cape Cod is Buzzards Bay, which is almost landlocked and forms a magnificent harbor. The passage from this bay to Long Island Sound is easy and can be made in all conditions of weather. Hence a vessel going from New York to Boston when the canal is completed has only to encounter the short stretch of water from Barnstable Bay to Boston.

The canal is exactly eight miles long. The country thru which it passes looks as tho nature intended a water way to be made there some day. It traverses the low salt marshes west of the town of Sandwich to the Scussel River, thence across a divide—at its highest point only 29 feet above the sea level —and then down the valley of the Monument River to Buzzards Bay.

At present the breakwater on the Cape Cod entrance, which will contain 350,000 tons of stone, is nearly finished, the Barnstable Bay channel is one-third done, the canal prism is about one-half done and the Buzzards Bay channel is three-quarters completed. Last month there were four steam shovels and a 16-inch suction dredge at work inland and five dipper dredges in the bays.

Some idea of the value of the Cape Cod Canal to commerce can be obtained when it is realized that at present the total tonnage of vessels now rounding the Cape is estimated at 25,000,000 and the passengers carried at 500,000. All this cargo will save 66 miles of its journey by going thru the Canal, and what this will mean in the saving of time and money and in lessening the hazards of the sea, is self evident. Liners, for instance, will save 4 hours and from $200 to $400 each trip.

The Engineering News of Jan. 9 says that while the construction of the Canal involves no novel engineering problems, it possesses a great deal of interest, due in no small measure to the vicissitudes of fortune thru which the construction of the Canal has passed during the 300 years of its history.

Water-Power for Western Railways

What is said to be only the beginning of an extensive use of electric power on railroads between the Rocky Mountains and the Pacific is seen in the Interior Department's grant of the right to transmit such power over the public domain to the Great Falls (Mont.) Power Company, for the electrification of 450 miles of the main line of the Chicago, Milwaukee & Puget Sound railway, between Harlowtown, Mont., and Avery, Idaho. This will be the longest stretch of electric railroad in the world. Secretary Fisher thinks that eventually such power will be used on all the railroads between the Rocky Mountains and the Pacific coast. John D. Ryan, head of the Great Falls company, predicts that 10,000 miles of road will be electrified within a few years. He asserts that there is enough available water power to operate all the railway lines west of a line drawn north and south thru the center of Montana, and north of a line along the southern boundary of Colorado. Altho the company sought only the right to transmit by wire, it accepted strict provisions in the interest of the public. The rental for the first ten years is merely nominal. Every ten years, however, it is to be readjusted. The Government may regulate rates and service, and power must be sold to the United States, to the two States, and to cities at prices as low as are paid by any other buyer. Power for the 450 miles will be supplied from nine separate and distinct plants, but these are owned by one company. The road crosses three mountain ranges, the Belt Mountains, the Rockies, and the Bitter Root chain. It is said that the cost will be $8,000,000, and that much will be saved eventually by the change, as one-third of the railroad's equipment is now used in hauling fuel. Electric motors, it is asserted, will run 1200 miles without inspection, while a distance of 150 miles is the limit for steam locomotives; also, that steam power costing $150 can be displaced by electric power costing only $40. The change will be in the interest of conservation, as the consumption of large quantities of coal will be avoided, and water power now going to waste will be used.

Doomed to Disappear

That Boston has perceived its harbor-front needs and is setting to work to win back its old-time supremacy in commerce, means improvements that probably will be approved by business interests but will be in some degree distasteful to visitors and idlers. To the man who loves the sight of masts and sails and to sit on a dock and talk to fishermen and tars, the announcement of Boston's waterfront plans is something to be regarded with forebodings. He is likely to have in mind the way the "modern" docks of New York shut off from his sight everything but glimpses of masts and the tops of funnels: the sight-hungry idler

CUTTING CAPE COD

BOSTON'S WATER FRONT HAS MORE CHARMS FOR IDLER THAN FOR BUSINESS MAN

may walk miles beside an impenetrable three-story wall of stone buildings.

To see Boston's water-front take on a similar appearance would seem to the loafer, the romancer and the artist as nothing short of a calamity. Robert Louis Stevenson said that lounging around harbor-sides was the richest form of idling. From this viewpoint, Boston, in becoming financially richer, will forfeit its wealth of old-fashioned harbor-side enjoyments.

The fishing fleet's docks, pictured above, are soon to be succeeded by a fish wharf 1200 feet long and 300 wide. This wharf, already under construction, will cost $1,000,000. On other port improvements the directors of the port are to expend $9,000,000 more. A wharf 1200 x 400 feet, now being rushed toward completion, represents the first unit of a terminal system for the largest ocean liners. Part of the equipment of this terminal will be a grain elevator.

St. Paul and the Mysteries

The old Greek mysteries were only for the initiated, and no ancient initiate has left us the tale of their secrets; but we have hints of them in various writers, and their sacredness colored speech. It has been a debated question whether the use of the terms "mystery" *(musterion)* "eye-witness" *(epoptês)*, "perfect" *(teleios)*, etc., in the New Testament are related to the technical use of these words in the Greek mysteries. Newer forms of the mysteries arose and were familiar in Asia Minor during the times of the Apostles. Some light has been thrown upon these by excavations of the ruins of the sanctuaries in which the rites of initiation were celebrated.

In a letter to the *Athenaeum* Sir W. M. Ramsay gives an account of investigations made by Makridi Bey, of the Turkish Imperial Museum, in the sanctuary of Apollo at Claros, a town on the Ionian coast. They record visits paid by representatives of various cities to the oracle at Claros. Some of them were initiated into the mysteries celebrated there and record the fact. Various terms are used, and these are of interest. Some say that they "*completed* the mysteries"—others who came as "enquirers" *(theopropoi)* "having been initiated *entered*" (the word is *embateuo)*, evidently a technical term. So another says that "having taken the mysteries he *entered.*"

This use of the word "entered" is of interest and throws light on a passage in Paul's Epistle to the Colossians, 2:18, which it thus translated in the Revised Version: "Let no man rob you of your prize, by a voluntary humility and worshipping of angels, *dwelling in* the things which he hath seen, vainly puffed up in his fleshly mind," or as given in the margin, "*taking his stand on* the things." This passage has greatly troubled commentators, and Westcott and Hort suspected an early error in the text. But the word translated

"dwelling in," or "taking his stand *on*" is just this technical term used by the initiates of the mysteries of Claros, "entered," *embateuo*. The word in Colossians is to be retained as correct. The "enquirer" "receives" the mysteries, is "initiated," and then "enters," or "takes his stand on" the new life to which he was introduced by "the things he had seen." It is probable that this entrance on the new life was by baptism in a pool in the presence of the seated god, after the manner of baptism in the earlier Eleusinian mysteries. This difficult passage from St. Paul is to be added to others which indicate his knowledge of the mysteries, to which he alludes as he does to the Greek games.

Resumption of War

On Monday of last week hostilities were renewed between the allies and Turkey after an armistice of two months. The initiative was taken by the allies, who had given warning that they would begin fighting in four days if their full terms were not accepted. They demanded that Turkey should give up Adrianople, and everything else up to the Chatalja lines which protect Constantinople. Turkey agreed to give up part of Adrianople, but wished to retain that side of the river which holds the famous Mosque and the tombs of the Sultans who resided there when Adrianople was the Turkish capital; but this did not satisfy the allies, nor would they listen to any advice of the Powers.

The war was resumed, not by any attack on the Chatalja lines, but on Adrianople, where the Bulgarians were aided by a large force of Servians with siege guns. Since then it has been very difficult to get any trustworthy news of the engagements, as all correspondents are strictly barred out on both sides. Both the Turks and the allies had brought up reinforcements during the armistice, and the Turkish soldiers from Asia were said to be in good spirits, and the Chatalja lines are reported impregnable. Possibly the difficulty which the allies would find there may explain the change of plan on the part of the allies who are directing their efforts against Adrianople, and also, in a new direction, at the Gallipoli peninsula, at the western entrance to the Sea of Marmova. The purpose of this is surmised to be to take the forts in the rear which protect the Dardanelles against access by sea to Constantinople, and to allow entrance to the Greek fleet. On the other side it is claimed that this would not allow entrance to the fleet, as the defenses on the Asiatic side are strong and the entrance is mined.

Inasmuch as no news reaches the outside world except such as is given out officially at Constantinople or Sofia, and full confidence is not given to it, we are as yet uncertain as to the result of the first week's fighting. There have been some sorties of the Turks at Chatalja which seem to have had no result. The bombardment is kept up at Adrianople, and the Bulgarians claim to have captured the defenses of one hill. We hear nothing further of scarcity of food in the city. At Gallipoli there have been minor engagements, but everywhere the Turks remain on the defensive.

There are sad stories of suffering among the Turks, and of the utter lack of money to pay the soldiers, and of frantic attempts to secure loans, and even to sell the crown jewels, but this may be rumor. We have no trustworthy news from Janina and Scutari beyond the capture by the Montenegrins and Servians of a hill which was an important defense of Scutari. The quarrels between the Turkish officers, growing out of the change of the Cabinet and the killing of the favorite general, are a source of weakness to the Turks.

Probably the chief fighting thus far has been about Gallipoli. The Bulgarian troops have captured several villages on the way that were feebly held, and in one more serious engagement are said to have taken 5000 prisoners. The Ottoman army defending Gallipoli is said to be from 50,000 to 75,000, who are thus withdrawn from the Chatalja defenses, and attempts to reinforce them by sea have been repulsed.

What Congress Is Doing

It is not expected that the Senate's resolution for a Constitutional amendment making the Presidential term six years and preventing re-election will be past in the House at the current session. It can be taken up only under a special rule, and the pressure of routine work leaves no time for additional topics which require extended debate. Moreover, some Democrats are unwilling that Mr. Roosevelt should be eliminated as a candidate for the Presidency. The House has past, by a vote of 240 to 65, the Webb bill, which probihits the shipment and transportation, in interstate commerce, of intoxicating liquors to be sold in prohibition territory. This bill is similar to the Kenyon bill, which has been past in the Senate. A bill has been past and sent to the President which empowers the Federal authorities to seize merchandise shipt to

our ports by Trusts or combinations, or under illegal contracts. It was suggested by the Government's suit with respect to Brazil's coffee valorization project and the Brazilian coffee stored in New York.

In a message to Congress, the President recommends the construction, by the Government, of two railroad systems in Alaska, in all about 733 miles, at a cost of $35,000,000. The railway problem in Alaska can best be solved, in his opinion, by Government ownership, with private operation under lease. He has heard testimony concerning the new Immigration bill, as to which Germany and Italy have submitted protests because of the provision authorizing our Government to place inspectors and surgeons on immigrant ships to report to our immigration authorities as to the treatment of immigrants en route. Arguments for and against the literacy test were made. Additional nominations have been sent to the Senate, those of several judges included, but filibustering by the Democrats continues to prevent action. More than 1500 nominations are pending. In the House, Representative Roddenberry, of Georgia, denounced the recent marriage of a white girl to a negro in Michigan, saying no jail in Georgia would be strong enough to hold the negro. The officiating clergyman, he added, ought to be tarred and feathered. He appealed to the States, urging them to forbid such marriages by law. In the Shipping Trust inquiry, Vice-President Schwerin, of the Pacific Mail, said this steamship company would go out of business with the opening of the Panama Canal, because its ships are excluded from the canal, and for the additional reason that the Pacific trade is almost monopolized by Japanese companies which are favored by subsidies and in other ways by their Government.

Another Revolution in Mexico

Felix Diaz, nephew of the former dictator, seized the arsenal in Mexico City on Sunday, February 9. Newspaper reports state that the garrison of the capital had declared for him and that all that remained to Francisco I. Madero, the Revolutionary President, was the national palace and the Chapultepec fortress. The people seem to have taken no sides in the military operations in Mexico City, the combatants on both sides being regular troops, cadets of the military college, etc.

Associated with Felix Diaz in the coup was General Bernardo Reyes, war minister under President Porfirio Diaz. Reyes had been in prison for over a year as a declared enemy of the Madero regime, but with Felix Diaz was freed by military cadets when the signal for the uprising was given on February 9. In the fight which followed Reyes fell—a bullet thru his head. Machine guns swept the square before the President's palace and the Government forces poured out a murderous fire from the towers of the Cathedral, killing and wounding many civilians as well as several hundred of their enemies. General Madero himself appeared as commander of the loyal forces, riding a big gray horse, but withdrew before the fighting began. Unable to secure assurances from the tottering Government, the representatives of foreign Governments have dispatched to Diaz thru the American Embassy a note saying that he will be held personally responsible for the lives of foreigners in Mexico City. When the note was

THE CHIEF OF THE MEXICAN REBELS

Felix Diaz, a nephew of ex-President Porfirio Diaz, was formerly Chief of Police of Mexico City, and until last summer a Colonel in the Mexican army. On October 16 he took possession of the city and port of Vera Cruz, heading a force of about 500 men. Nearly all the federal troops there joined him, also 1000 volunteers. Three of four Mexican gunboats in the harbor fell into his hands, but his revolutionary movement collapsed on October 23, when federal troops led by General Beltram easily captured the city and took Diaz prisoner without much fighting. Diaz seemed to have fallen into a trap prepared for him by the Madero Government. Four days after his capture he was condemned to death by a military court. The execution of the sentence was, however, suspended, and now he has been released by mutinous cadets, and seems to command the situation.

dispatched, however, there were no evidences of anti-foreign feeling on the part of combatants or civilians. Only one mob assembled on Sunday, and this attacked the building of *El Pais*, the only independent morning newspaper publisht in Spanish.

Our Government will perhaps dispatch a part of the Atlantic battleship fleet to Vera Cruz. It is now stationed at Guantanamo, Cuba. Armored cruisers are within easy reach of Mexico's western ports, and General Steever has 5000 men of the regular army on the Mexican frontier. But military action on our part need not be anticipated

except as a last resort. President Taft seems bound to refrain from interference, for in his last month of office he wishes to avoid embarrassing the next administration by endowing it with an international imbroglio, or military operations.

London Paupers

Nearly five per cent, or 48.8 persons out of every 1000 of London's population are paupers, and the London *Times*, in discussing this amazing fact, declares that "the proportion of the population which is wholly or partly maintained by others is rising."

In 1900 the total number of "legal paupers" was 103,091, or 22.8 per 1000 of population. In 1912 the number was 110,262, an increase of 7171, or 24.4 per 1000 in twelve years.

But these figures do not by any means tell the full story of London's poverty. The operation of the State Insurance Act, the Old Age Pensions Act, the State Feeding of School Children (State Maintenance), and so on, under which masses of dependent persons are transferred from one fund or authority to another, materially increases the statistics. Relief to necessitous persons, that was formerly not given at all, or was given under the Poor Law, is now given under a number of other laws. Thus, "legal paupers" in the review exclude Old Age Pensioners, the great majority of whom are virtually paupers, numbering in London alone 64,212. The figures for the other groups are not given, but on account of this "breaking up" of the Poor Law the number of paupers must be doubled. That is, 220,524 persons in London are paupers.

Even this tremendous figure is, however, an underestimate, for there should also be included those thousands of persons who, while destitute and homeless, resort to the common lodging-house, England's poor having learned by bitter experience that prison food and prison rules are better than those of the workhouse, and the latter institution is avoided like the plague. Accordingly, coroners' juries returned in 24 cases in 1912 the verdict "death by starvation," this form of death being more usually described as "death from natural causes." These factors together add greatly to the appalling sum of Imperial poverty.

It is pointed out that meantime England's trade is prosperous, her imports and exports grow, and her manufactures increase. The richest city in the world shows progress all around, but particularly in the production of poverty.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Newark and the Prudential

The city of Newark, N. J., in its efforts directly to tax the deferred dividend fund of the Prudential Insurance Company, undismayed by two adverse court decisions, is now engaged thru its representatives in trying to secure the enactment of a law by the Legislature of New Jersey that will sweep away existing legal obstructions and enable the municipality to levy on the fund, which now exceeds $30,000,000.

Considered from any viewpoint, the attitude of the city puzzles the understanding. Surplus funds are built up out of premiums received. The premiums of the Prudential are assessed for taxation by the several States, each State, including New Jersey, deducting its share from the premiums paid by its citizens. Hence, it follows that tribute has already been exacted on this form of property.

Again, the material interests of Newark have been vastly benefited by the Prudential Insurance Company. That company has become a reservoir fed by golden streams that flow from every part of the country. The Prudential virtually makes Newark the custodian of a yearly income of approximately $50,000,000. There are dozens of cities superior in size and importance to Newark which would be glad to have a like accumulator of capital on any reasonable terms. Perhaps, to secure such a treasury, they would go so far as to exempt from taxation an institution of such material value.

Amending the Accident Policy

After a year spent by a committee of the National Convention of Insurance Commissioners in preparing and perfecting certain standard provisions for compulsory use in the accident and health policies of all companies writing that kind of insurance, the measure embodied in a bill is ready for action by the several State legislatures. It was introduced in the New York Legislature last week at the request of Superintendent of Insurance Emmet and will doubtless be adopted and approved. It is intended to supplement and perfect the present law, the object sought being a corrective one in amending certain practices found to exist in the accident business and to eliminate some objectionable features from the policy contracts in general use.

Manner of Selecting an Umpire

By way of preventing litigation, the present form of fire insurance policy contains a provision that in the event of disagreement between the insured claimant and the company over the value of damaged or destroyed property, resort may be made to the services of three appraisers, one selected by each of the interested parties, the third, an umpire, chosen by the first two appraisers. A bill introduced in the New York Legislature last week, at the instance of the Insurance Department, provides that after June 30, 1913, every fire insurance policy shall carry an endorsement to the effect that in case of disagreement between the appraisers selected by insurer and insured over the choice of an umpire, either may apply to the courts for the appointment of a competent and disinterested person to act in that capacity and that the decisions of the umpire so selected shall be binding upon both the principals to the contract.

Deferred Dividend Life Policies

Inquiries are occasionally received by this department asking advice on the desirability of continuing in force life policies which provide by their terms that the dividends shall be accumulated during a term of years—ten, fifteen or twenty—and their payment deferred to the expiration of the contract term. We regard the deferred dividend policy as a poor contract for the assured, particularly if, as is usually the case, he forfeits his accumulated earnings if he lapses or surrenders his policy or dies before the expiration of the deferred dividend period. But on general principles we would advise against the surrender of these contracts for the purpose of replacing them by others which seem to be and perhaps are superior in their terms, especially if they have been in force as many as five years.

Unless the company itself is of such a character as to arouse apprehension or its financial condition seems unsatisfactory, the judicious thing is to carry the policy to termination and thus secure all the benefits it affords. We have a high appreciation of the old-fashioned reversionary addition, thru which unused dividends are automatically converted into additions to the face value of the policy as a death claim, but which in time of need by the policyholder, in his lifetime, may be surrendered for their cash value. We would counsel policyholders to consider carefully before swapping any policy in a good company for another that some enterprising agent claims is a better one. Get disinterested advice before making a move.

Union Central Life

The annual report of President Clark to the stockholders and the policyholders of the Union Central Life Insurance Company, of Cincinnati, together with the balance sheet of the company for the year ending December 31, 1912, indicate a year of substantial prosperity as the result of the efforts of the field and office staff. During each month of the year the company made an increase of written and paid for business over the same period of the year before, with the result that the annual total aggregated $47,618,486 on 19,613 lives. The President states that industrious efforts were made to conserve existing business and reduce lapses. That the efforts were successful is evident by the gain of 9980 in the number of policyholders and $26,479,838 in insurance in force. These figures bring the total number of policies in force to 172,372, covering nearly 348 millions of insurance.

The premium receipts aggregated $11,912,978, to which we must add $5,296,394 interest and rents, and these, together with about $80,000 receipts from sundry sources, make the total income $17,289,602. Never in any one year have the policyholders been paid so much in death losses, endowments, surrenders and dividends, the whole aggregating $8,706,016. The excess of receipts over disbursements was $5,779,447. President Clark observes that the farmer is a better interest payer than the policy borrower. He states that on $14,075,084 of policy loans there was $51,497 of interest past due, while on $70,694,166 farm mortgage loans there was $64,308 interest past due.

The company closed the year with total assets of $93,053,614; against which appear the following liabilities: For reserve on outstanding policies, $74,237,097; special reserve on life rate endowment policies, $9,728,650; apportioned for 1913 on life rate endowment and survivorship dividend policies, $968,271; apportioned to annual dividend policies for 1913, $2,091,698. The total surplus is $4,097,545, of which $2,348,603 is derived from participating business, $1,248,942 from non-participating business and the cash capital of $500,000.

The Aetna Fire

Altho the caption to this notice is not accurate in so far as the company's legal corporate title goes, it is informing, for we are now considering the 1912 record of the Aetna Insurance Company of Hartford, Conn., in the name of which the word "Fire" does not occur. The company is known all over the country, especially among the tens of thousands of agents in the land, as the "Old Aetny," but our "lay" readers must have something more definite than that, so we must fix it precisely by explaining that we are writing about the Aetna which does a fire insurance business exclusively—and successfully. Its success has extended over ninety-four years of this country's history, many of them years of panic, industrial, commercial and agricultural failures, and a half dozen or more marked by destructive conflagrations. During that period the Aetna has distributed a total of 133 million dollars in fire losses, and turns into the year 1913 with $23,051,531 of accumulated funds, invested in securities of the highest class. The gain in assets for the year was $1,034,141, while the net surplus increased $404,197. The reserves, principally for the reinsurance of outstanding insurance, stood at the end of the year at $9,813,139, which, with the capital stock, brought the gross liabilities to $14,813,139. This gives us, as a difference between assets and liabilities, $8,238,392, to which must be added the $5,000,000 of cash capital, or $13,238,392 as the measure of the policyholders' surplus.

The Phoenix Mutual Life

An examination of the sixty-second annual statement of the Phoenix Mutual Life Insurance Company of Hartford, Conn., for the year ending December 31, 1912, shows total assets of $34,296,116, a gain for the year of $1,956,014. The principal items of the assets consist of $20,468,661 first mortgages on real estate, $6,943,171 stocks and bonds and $4,702,247 loans on the company's policies. The outstanding insurance

aggregated $147,652,325, a gain of $11,755,-109, in support of which the company maintains a reserve variously calculated at 3 per cent, 3½ per cent and 4 per cent of $31,580,112. It should be noted that of the total of outstanding insurance all but about thirty-four millions is valued at the highest standard of 3 per cent. There is a net surplus beyond all present and future liabilities of $1,139,202, in addition to $940,935 for dividends payable in 1913 and $60,923 for dividends provisionally apportioned for 1914 and subsequent years. During 1912 the company increased the number of its policy-holding members by 6092, bringing the total to 78,192. In ten years the premium income has gone from $2,769,094 to $5,387,-129; the assets from $15,699,212 to $34,-296,116; and the insurance in force from $70,864,592 to $147,652,325.

Massachusetts Fire and Marine

With total assets at the close of business December 31, 1912, of $1,337,857, and a surplus to policyholders of $873,208, the Massachusetts F. & M. Insurance Company of Boston shows an increase in assets of $119,064, an increase in re-insurance reserve of $128,460 and increase in net premium receipts for 1912 over 1911 of $137,-768. Altho the company is but two and one-half years old, its net premium income aggregated $531,510 last year. Its losses were $249,463, or about 47 per cent of its premiums, with expenses at about 43 per cent.

New England Mutual Life

This very conservative New England life insurance company made a handsome increase in its outstanding insurance during 1912, the gain being $21,431,851, bringing the total in force to $254,249,583.

The sixty-ninth annual statement of date December 31, 1912, shows assets of $61,418,-398, of which bonds and stocks appear of a market value of $35,440,555; loans on mortgage, $13,224,050; loans on the company's policies, $8,749,652; and real estate, $1,901,-263. Under the Massachusetts standard the policy reserve is valued at $54,318,040. The increase in gross assets was $2,978,297, and in policy reserves $3,320,581. With $477,261 of surplus accrued appearing in the liability column and $1,735,000 apportioned for payment to policyholders during 1913, there remains a net surplus of $4,088,810.

Boston Insurance Company

The financial exhibit of the Boston Insurance Company for the year ending December 31 is a fine one, showing an increase in assets of $1,034,551, in reserve on outstanding policies of $56,841 and in net surplus of $1,073,994. The balance sheet as of the date mentioned shows total assets of $6,787,060; total liabilities (including capital stock), $3,565,572, and net surplus, $3,220,488. The Boston has paid in losses since organization $40,200,838.

The Atlantic Mutual

A wonderful corporation is the old Atlantic Mutual, one of the strongest marine insurance companies in the world. It closed 1912 with $13,623,851 of assets and a surplus of $2,603,261. But with its usual conservatism, the management has omitted some items aggregating about two and a half millions more, which on a proper and approved valuation makes the surplus actually $5,185,044. The company's premium receipts last year were $4,822,884 and its paid losses $2,104,257.

Notes

The officers of some of the mutual casualty companies have organized the Employers' Mutual Casualty Federation of America at Chicago, the stated objects being: To encourage coöperative accident prevention work and promote the science of accident prevention engineering; to demonstrate the inconsistency and fallacy of State insurance; to guard against use for personal gain of the natural sentiment in favor of mutual insurance; and to coöperate in all things for the common good of the numbers. The officers are: President, J. C. Adderly, of the Millers' Mutual Casualty; vice-president, Victor A. Trundy, of the American Mutual Liability; secretary-treasurer, E. T. Bent, of the Illinois Coal Operators' Mutual.

The right of the States to enact and enforce fire insurance rating laws is to be argued before the Supreme Court of the United States. Counsel of the fire insurance companies states that it is of great importance to the companies and the public to ascertain as soon as possible whether a State has the right to fix the price at which private corporations or individuals shall sell the commodities in which they deal.

Income Tax Legislation

By the vote of Delaware, on the 3d, the ratification of the income tax amendment was assured. Wyoming's approval was given almost at the same time. New Mexico and New Jersey followed, and then there were 39 States in the list, or three more than the required three-fourths. This Constitutional amendment, the first to be adopted in nearly 43 years, empowers Congress "to lay and collect taxes on incomes, from whatever source derived, without apportionment among the States, and without regard to any census or enumeration." The income tax law of 1894 was declared unconstitutional by a vote of 5 to 4 in the Supreme Court, because the proposed tax, a direct one, was not apportioned among the States according to their population, as the Constitution required. The power thus withheld from Congress is now given to it. Of those who supported the amendment, some held that the power should be exercised only in an emergency, while others were of the opinion that an income tax should be levied without delay and should be a permanent one.

The present tax on the net earnings of corporations, which yields about $28,500,000 a year, was proposed at a time when a considerable number of Senators and Representatives were inclined to impose an income tax, altho it was not known that a reversal of the Supreme Court's decision could be expected. This corporation tax has been sustained by the court. Last year, in connection with the proposed removal of the duty on sugar, the Democratic House sought to extend the corporation tax to individuals and partnerships by means of what was called an excise tax, which was really a disguised income tax. It was estimated that this excise tax wou'd yield about $60,000,000 a year.

It is the purpose of the Democratic majority in the House—which will be associated with a Democratic majority in the Senate after March 4—to impose an income tax by legislation in connection with tariff revision at the approaching special session. The bill will be prepared, it is understood, by Representative Hull, of Tennessee, the author of last year's Excise Tax bill. It is estimated that a rate of 1 per cent upon all incomes in excess of $5000 will yield about $100,000,000 of revenue. Probably the present corporation tax would be repealed. But the rate will depend upon the estimated effect of projected tariff changes. Reduction of customs revenue might call for more, or less, than $100,000,000 to fill the gap. Removal of $53,000,000 of sugar tariff revenue cannot be expected, it is said, because at least two Democratic Senators (from Louisiana) will vote against it, and the Progressive Republicans will not vote for it. How the revenues will be affected by changes in other parts of the tariff cannot now be ascertained.

If a large addition to the annual receipts is to be made by an income tax, the tariff revisers will feel free to reduce customs revenue by removing some duties and cutting down others that are now productive. In this way the tariff program will be affected by the proposed income tax. It may be that the exempted income will be less than $5000, possibly $4000, or even $3000, and that the bill will provide for a graduated tax; that is to say, that the rate for very large incomes will be higher than the rate at the bottom. The details are still to be determined, but it appears to be the settled purpose of the dominant party in Congress to pass an income tax bill at the special session.

In the last two weeks the price of Pennsylvania crude petroleum has advanced from $2.05 to $2.50 per barrel, the highest figures in nearly 20 years. For a year and a half before the dissolution of the Trust the price was steady in the neighborhood of $1.30. The Standard Oil Company of New Jersey, formerly the parent corporation of the Trust, distributed to its stockholders last week $39,332,000, or $40 per share, procured by the payment of loans or advances made to the subsidiaries prior to dissolution. The American Tobacco Company, by an extra dividend of 15 per cent, distributed about $6,000,000, gained by the sale of securities. It also doubled the rate of its regular annual dividend.

The Antarctic Tragedy

For ten months in their double tent, on the ice plains of the Antarctic continent, lay the frozen bodies of the three heroes who, for the honor of England, had sought and reached the Southern Pole, while the world wondered and waited and feared. They had left behind them in the waste their two companions, whose strength had failed them and who had died. At last the word was flashed from New Zealand, and immediately the memorable, pitiful story was repeated in every hamlet in Christendom. So deep, so universal, is the sympathy of every soul for courage and self sacrifice even unto death.

Why, after a magnificent success happily achieved, did they fail to bring back with them the glory of conquest? Was it because their disappointment at finding that another had anticipated them had broken their hearts? We cannot tell. We only know that Seaman Evans went insane with suffering and cold, that he was carried along as far as he could go, and then lay down to die. We know that when Captain Oates could go no further he was left, a tale for the ages of sublime self-martyrdom. We know that they prest on slowly, painfully, unfed, unwarmed, and that they were found, having exhausted both food and fuel, victims of the supremest forces of nature, conquered in body, only eleven miles from relief, but never conquered in soul. Was there some mistake, some overdraft of fuel by one of the supporting parties that had been sent back? We do not know; perhaps it is best that we never shall know. They were heroes, and the good world of ours has bred many such, in high station and low, and will breed many more.

Dr. Jackson, in one of his summer trips from Alaska to Lapland for reindeer, was told by the pagan Lapland chief with whom he had bargained that the next summer he would not be there. He would be too old to follow the tribe in their migrations, and, after the custom, he would take with him a portion of food and go out into the lone desert of snow and lie down to die. The old man, the weak man, must not endanger the tribe. That was the brave ethics of barbarism.

Even so, but not with the stolidity of the savage, died Captain Oates. He could go no farther. His strength was quite exhausted. They would have helped him along and died with him, but he would not consent. He begged them to leave him, that he might not destroy their chance of escape, but they refused. Yet they knew that to carry him or to remain with him was equal to death for all. Then he staggered painfully out from the tent, saying, "I am just going outside. I may be some time," and they knew he would not return. They could not restrain him, they

knew it was best that one die that all should not perish. They waited silently for half an hour, and he came not. Then they knew they need wait no longer, and the three survivors prest on to snatch if they could the last chance for life which his death had given them. It was too much; it was too late. They too were the sacrifice which godlike courage demands of mere human strength. The ages will long carry their names to illustrate the high spirit of constancy and faith that fights fate to the death and in death overcomes. But no eloquence will ever match their worth;

"For thereunto doth need a golden quill,
And silver leaves them rightly to devise."

Thank God that task is achieved, and the search for either Pole will demand no more victims. But the race of heroes will not fail. Other lives will be offered just as freely, some for glory, more for duty and service, whenever country calls on humanity, and God points the way to the perilous attempt that allures the great heart.

For Peace in Mexico

Mr. Taft's attitude toward Mexico during the revolution which sent Porfirio Diaz into exile and gave the Presidency to Francisco I. Madero was characterized by patience and good judgment. Such is his attitude now, and we are glad to hear that the leading men of both parties in Congress are in agreement with him. It is reported that in his opinion nothing but a massacre of American residents in Mexico could warrant armed intervention. But he finds it expedient to send warships to Mexican ports and to be prepared for such action as may possibly be required for the protection of American lives. It is his duty to do this. He most earnestly desires to avoid intervention, and this should be the desire of the people of the United States.

Intervention in Mexico would mean war. And what kind of a war? Military experts who are familiar with the situation say that all factions in Mexico, forgetting their differences, would unite to oppose the intervening force; that American residents would be the first to suffer death; that an army of 250,000 men would be required; that their services would be needed for two or three years, and that the money cost would not be less than $1,000,000 a day. It is said that this was the answer to an inquiry addrest by Mr. Taft to a military adviser whose opinion he sought. Every effort not forbidden by the dignity of a great nation and its regard for its citizens residing abroad must be exerted to prevent such a conflict.

We believe that war with Mexico would be little short of a calamity. The war might be ended in two or three years, but it would probably involve acquisition of territory, and the employment of an armed police force for many years to come in restraining and governing a bitterly hostile population, more than 75 per cent of which is illiterate. And there are also to be considered the war debt and the new taxes, the demoralizing effect of war in our own affairs, the diversion of the energies of our people from domestic problems and reforms. War with Mexico might check our progress for a quarter of a century. To our own losses would be added those of Mexico, which every enlightened Mexican patriot would deplore.

If President Madero and Felix Diaz are patriots, having the interests of the Mexican people at heart, they will welcome any friendly project for the restoration of peace and the establishment of good government in their country. The conception and elaboration of such a project may well engage the minds of good men on both sides of the Rio Grande. The appointment of a commission has been suggested, and there are men of prominence at Washington who hope, it is reported, that Justice Gerard, of the New York Supreme Court, president of the Mexico Society, can be induced to undertake a mission of inquiry and conciliation in Mexico.

Mr. John Barrett, director of the Pan-American Union, in which a score of Latin-American countries are interested, would have a commission composed of such men as Senator Root, William J. Bryan, the Washington diplomatic representatives of two or three South American republics, and Señor De la Barra, of Mexico. His proposition has not been well received by the American colony at the Mexican capital, or by our State Department, yet it deserves careful consideration.

If the warring factions in Mexico are to be approached by any commission seeking to mediate or to conciliate, and if the initiative in any such project is to be taken in the United States or by our Government, the commission should include representatives of two or three South American countries far removed from the scene of disturbance. We should suggest Argentina and Brazil. The people of the United States do not want to deprive Mexico of any part of her territory. A vast majority of them desire that Mexico shall be peaceful, prosperous and intact. But many who live in the countries south of us are not convinced that this is our attitude. Secretary Knox said last year to the Assembly of Nicaragua:

> I beg to assure you, and I am sure that what I say meets the approval of the people and the President of the United States, that my Government does not covet an inch of territory south of the Rio Grande. The full measure and extent of our policy is to assist in the maintenance of republican institutions upon this hemisphere, and we are anxious that the experiment of government of the people, for the people and by the people shall not fail in any republic on this continent.

Any attempt to mediate or to conciliate in Mexico should be made in such a way that suspicion as to motive would surely be disarmed, and the coöperation of unbiased South American republics should be sought.

Those who desire to see peace and decent government in Mexico, and who realize how harmful, in many ways, intervention and war would be, should strive to devise some plan of conciliation that will not offend our sensitive Mexican neighbors, but will be regarded by them as an expression of friendship. This is not an easy task, but it is not an impossible one. It seems to us that the work can be done, if undertaken by eminent and tactful Americans, who are familiar with the problem, who will wisely seek assistance from the Far South, and who can use the diplomatic skill that the situation demands.

Clearing the Papal Docket

The ecclesiastical historians in the name of Pius X have eliminated four doubtful Popes, Boniface VI, Boniface VII, John XVI, and Benedict X. The reason given is that the Pope is not sure that the four should be on the Pontifical list. Furthermore we are assured that he intends to strike out more doubtful tiaras. The purgating process is a high compliment to an author and work under the ban, viz: Duchesne and his "Liber Pontificalis." It is also a bit of a consolation to the Anglican divines, whom Leo XII so cruelly snubbed. Of course, the clever canonists will get over the difficulties of Apostolic Succession without any allusion to Duchesne and with the complete annihilation of Anglican claims. That is why they are canonists and theologians.

The President's Veto

The last great act, it may be, of President Taft's administration, is his veto of the evil immigration bill. Congress may override it; but, as a President can, he has honored his responsible office. Would that he had exercised the same wisdom by vetoing the Canal Tolls bill.

Mr. Taft took full time to consider the question of veto. He heard arguments on both sides, as if he were sitting in a court. There were in the bill excellent provisions which ought to be embodied in law. But it had one fatal fault: it shut out aliens who

cannot read. This was the central provision of the bill, but not its real object. Those who devised it were not afraid that the admission of a minority of illiterate immigrants would be dangerous to our free institutions or to public morality. The danger is greater from those who can read; they are the anarchists, the Black Hand leaders. The object was to shut out workers, to hold the jobs for those who are here, as if our wide country did not offer opportunity enough for all who will come these next hundred years. Secretary Nagel puts the case clearly when he says that on its merits the bill cannot be defended, and "its final purpose is to reduce the quantity of cheap labor in this country," and it is, he says, "urged for a reason we are unwilling to assert"—he might have said, ashamed to assert.

The bill provides for the exclusion of unskilled labor. But this is just the labor which we most need and which our native people do not supply. They want something better. It is true that there is congestion in a few Eastern cities, and conditions are sometimes deplorable. But even so they are better than those from which these immigrants have escaped; and there are deplorable conditions in sections of the country inhabited by those whose ancestors came more than a hundred years ago. What we need is in some way to distribute the immigrants so that they may be directed to sections where labor is most in demand. They are to a surprising degree already settled in the country districts and occupying farms.

Yet, for us, it is not the economic consideration that is most to be considered, but the sentimental, the philanthropic one. If these immigrants are illiterate, it is because their governments have opprest them in discouraging their education. They come to improve their condition while paying good work for their support. Our history has ever welcomed the opprest of all the world. Let them come so long as we have room for them. In blessing them we shall be twice blest. It is a shame to shut any out because they are poor, or poorly taught, if they have the desire to secure a share in our free institutions. We thank President Taft for his veto. May Congress be also wise.

Racial Arrogance

While we agree with Senator Bacon that the necessity of intervention on our part in Mexico would be most unfortunate for us, we cannot accept his statement as to one of its effects. He says:

> If we went into Mexico it is very doubtful if we should ever come out of it. If we were to attempt thereafter to hold Mexico and govern that country it could only be by making it a subject colony, as it could never become a part of our representative government.

It might be, as Senator Bacon implies, that another war with Mexico would end with more annexation of Mexican territory, which our people do not now desire; but we would not dare to say that neither Mexico nor any part of it could ever "become a part of our representative government." Why not? Because they are Mexicans, Greasers, and not proud Anglo-Saxons? Is there anything in the Latin intellect that makes it impossible to conduct a representative government? Is not France doing it? Why cannot Spanish-speaking people do what French-speaking people are doing? There are Mexicans who are as fine and able and competent as we Americans are, and with education the rest can be trained as well as we have been.

It is intolerant and intolerable conceit to claim for our race, our people, an exclusive right to the possession of traits which other peoples can never acquire. It is the kind of language which makes the nations to the south suspicious of us. It is an arrogance unjustified by any scientific evidence of our native and inherent superiority and their necessary inferiority. There is absolutely no reason why, if any portion of Mexico

should be annexed, it would have to remain as a subject possession, with no hope of admission to Statehood. We have, after a period of tutelage, made States of a big territory taken by war from Mexico in 1848, and we could do as much again. We already have 300,000 Americans in Mexico.

But we do not want intervention or war or annexation. We want peace in Mexico and with Mexico. The moral of all this is that we should provide for the ultimate admission of Porto Rico as a full, self-governing territory, and later as a State.

What Is Slavery?

We hear much in these days of industrial slavery, and have been much puzzled to know just what the term means. The word is in every eloquent labor speech or Socialist speech. Do those who use it mean what that bad word has hitherto meant in our history, or something quite different?

Take a single case of its use, as given in the reports of the last week. Mr. Gompers, head of the Federation of Labor, is thus quoted in an address against compulsory arbitration, such as they have in Australia and New Zealand:

> It would make it unlawful for men and women to stop work, and would visit any cessation from labor with fines and imprisonment. When you have done that you have taken away from workers their sole opportunity to enforce some degree of respect for their claims upon society, and have re-established slavery of the worst kind in this country.

We are not just now raising the question of compulsory arbitration, but solely that of the meaning of the word *slavery*. This compulsory arbitration, he says, would be "slavery of the worst kind," because it might forbid a strike. Now we have known slavery in this country, in which a workman had no wages, was fed and clothed as the master chose, was whipt if he did not work to suit the master, was caught and whipt if he ran away, was not allowed lawful marriage, was not allowed to learn to read, and he or his wife or children could be sold where he could never see them again. That was the slavery we were familiar with till Abraham Lincoln's day, and the memory of which clings to the definition of the word.

It is evident that this "worst slavery" is not like that. These slaves could, as they do in Australia, contract for their labor, choose their own food and clothes, leave work, at least individually, when they pleased, marry and keep their families, read and publish newspapers which criticise their employers, even vote and make laws binding on their employers. They can live in their own comfortable houses and be respected citizens. This is not slavery as we know the word.

Well, what does it mean? So far as we can see, in its use by Mr. Gompers, it means the restraint of liberty to enter a combination to stop work unitedly without first submitting the difference to impartial arbitration, and the obligation to submit to such arbitration *en masse*. But under what rhetoric this agreement, which the workingmen of Australia and New Zealand have chosen to put themselves under, should be called slavery, and that of the worst kind, we fail to understand. It is not anarchy, but we should call it a phase of freedom.

An Industrial Board

If you are too sensitively organized to enjoy your food with your eyes open, or if it would hurt your feelings overmuch to see men and girls plunging to death from flaming factory windows, you might not enjoy reading the report of the New York State Factory Investigating Commission, which was laid before the Legislature last week. Its pictures of daily and nightly life in the up-State canneries, in subterranean bakeries, in crowded lofts and tenements where toiling women and children are huddled, and in scores of trades that, by the very nature of the operations carried on, are deadly, were prepared for such well-toughened humans as

legislative committees are made of. Yet it must be hoped that enough laymen—and women—will study its pages to insure the creation of a public opinion too determined for legislators to disregard it with impunity.

The commission was created by the Legislature of 1911 and continued by the Legislature of 1912. Its chairman was Senator Robert F. Wagner, and among its members, besides Assemblymen, have been Samuel Gompers, president of the Federation of Labor; Mary E. Dreier, president of the Women's Trade Union League of New York; Simon Brentano, Robert E. Dowling, Frank A. Tierney, secretary; Abram I. Elkus, chief counsel, and Bernard L. Shientag, associate counsel. The report bears abundant internal evidence that Mr. Elkus has been far more than a mere professional adviser. He has plainly devoted to this work the thought and labor of a man deeply interested in finding ways and means to deal with intolerable conditions, to which civilized society must put an end.

The commission makes specific recommendations touching fire prevention and overcrowding, and relating to industries carried on in tenements, and conditions in the dangerous trades. Among these the most noteworthy is the commonsense proposition that the number of workers in any factory building be limited by the capacity of the stairways. But the commission has realized also that an existing situation calls for something radically different from a further multiplication of specific statutes. With wisdom and courage it has accepted the clear teachings of experience and of scientific analysis, and has proposed the one plan which will bear examination.

"Laws enacted to protect industrial workers and to improve their condition," the commission says, "are of little value unless adequate machinery of government is provided to administer them intelligently and to enforce them effectively." The Department of Labor is charged in this State with responsibility for administering statutes relating to the health and safety of nearly 2,000,000 industrial workers. It therefore should be one of the great and preëminently useful departments of the State. In fact, however, it has confined its efforts to police duty in protection and punishment of violators of particular provisions of the statutes. "It has utterly failed," the commission says, to develop its true function of promoting the constant improvement of working conditions.

The ineffectiveness of the administration of the labor law the commission attributes to defects in the law itself, framed on a mistaken theory. Provisions so specific and rigid as to make their enforcement unjust or impossible are the net product of this theory, which ignores the endless diversity and the ceaseless variation of industrial conditions. The commission says:

> In Europe the futility of regulating labor conditions by specific statutes was recognized a long time ago. There the statutes are very broad and general, and power is given to administrative boards to make rules and regulations for their application.

The commission accordingly recommends that an industrial board within the Department of Labor be created, to consist of the Commissioner of Labor as chairman of the board, and four associate members to be appointed by the Governor. This board should be given power after a public hearing to make, alter, amend and repeal rules and regulations to carry into effect the provisions of a general labor law or industrial code, and to apply them to specific conditions by specific means and methods. The Commissioner of Labor should remain as now the administrative head of the Department of Labor, and individually responsible for the enforcement of the law.

The report goes fully into the question of the constitutionality of such a delegation of power, and argues convincingly from decisions of the Court of Appeals in this State, and of the Supreme Court of the United States, that legislation per-

mitting such full power of regulation by an administrative body will be sustained.

We are confident that these well-considered recommendations will be enacted. They are backed by the opinion and influence of the most enlightened elements of the community, and by conclusive experience elsewhere. The benefits of morality, health and prolongation of life which they would insure to millions of industrial workers would be great beyond possible calculation.

The Times Change

An interesting example is given by Dr. R. F. Horton, a distinguished English Congregational minister, of the way the times change and men change with them.

Thirty years ago Dr. Horton, who was then leaving Oxford, was appointed an examiner in the Rudiments of Faith and Religion for those who were taking a degree. His nomination excited the greatest opposition in the Anglican Church. The country clergy crowded Convocation and his name was rejected. He had many an insulting letter from clergymen and others, as if he had obtruded himself on the sacred preserves of the Church. Among those who most positively, but yet very courteously objected, was Canon Scott Holland. He explained to Dr. Horton that his opposition was not on personal grounds, but he thought it intolerable that a Nonconformist should examine men on the Thirty-nine Articles of the Church. The opposition was decisive, but was presented in so kindly a way as only to endear to him his opponent.

Thirty years have past. Now by the late action of the Congregation a Nonconformist can not only be an examiner, but can receive theological degrees at Oxford; and this has been done largely by the appeal for liberty made by this same Dr. Scott Holland, now Regius Professor of Theology. During these years Mansfield College, the Congregational college at Oxford, has gained theological eminence in the university, with both its students and professors. It has shown that Dissenters could be the best of Christians and scholars. But this is only a fraction of the influence that has made the change of spirit. All the churches are turning to unity rather than controversy. They are learning to value more the essential and less the accidental and subordinate. It is just so in this country. Denominations are coming together, consolidating or at least federating in good fellowship. Close communionism has pretty much died out. It lingers only in dusky shades. It was not so thirty years ago. The things that divide are seen to be of little account, and we are forgetting that they still separate us by almost invisible barriers easily crost. Prof. Scott Holland is simply one of the millions.

The Mistreatment of Castro

The immigration officials at Ellis Island and elsewhere are officers of the Government, with semi-judicial functions. Among other duties they pass upon the eligibility of immigrants and decide, subject to appeal to the Secretary of Commerce and Labor, whether they shall be excluded from our shores. Immigration officials have no more business to prejudge a case or to find pretexts to exclude an alien because a Secretary of State does not like him than a judge has to favor the defendant against the plaintiff.

Yet the Ellis Island authorities, apparently inspired by some one high in the Administration at Washington, have left no stone unturned to keep ex-President Castro out of the country. When he arrived here weeks ago they kept him in confinement with a guard in front of his door. No one could gain access to him. He was even denied the right of counsel till the case came before the courts. Every effort was made to induce him voluntarily to leave our shores. That failing, and after much delay, he was brought to trial before the Ellis Island authorities.

As Castro had passed the medical examination and no one could accuse him of being a pauper, it was proposed to exclude him on the ground that he had given orders to murder Paredes, a Venezuelan revolutionist. The law says that only one who has been convicted of a crime involving "moral turpitude," or who admits he has committed such a crime, shall be excluded. Yet the State Department sent cables to Venezuela to get the evidence in the case.

As of course Castro had never been "convicted" by a Venezuelan court of murdering Paredes, the immigration authorities decided Castro was a criminal within the meaning of the law because he refused to answer the questions put to him about Paredes. In other words, Castro was declared guilty because he refused to incriminate himself—a most extraordinary principle of legal justice. This, however, was sustained by Secretary Nagel on appeal, who, it was said, even called a Cabinet meeting to consider it.

Then the case came up for review before the United States courts and Judge Ward last Saturday made short work of the fallacies of Commissioner Williams, of Ellis Island, and Secretary Nagel, and admitted Castro to the country. The case may, of course, be appealed and possibly even reversed. Nevertheless we do not recall any previous instance where a foreigner seeking entrance to our shores has been subjected to such shabby treatment. And this we say without assuming to defend Castro's administration or his personal character. If an alien is to be kept out of the United States arbitrarily and without law we might as well adopt once and for all the blessings of a Russian bureaucracy and have done with it.

As to Ellis Island we suggest that President Wilson ask his new Secretary of Commerce and Labor to make a thoro investigation of conditions prevailing there. Other instances have come to our attention that would seem to indicate that the Bureau of Immigration needs looking into.

Food Prices

The Census is giving us data that help to explain American life and have a good deal to say about the prevalence of high prices. The trouble rests in part on the lack of balance between increase of population and increase of crops for food. We have in the United States about 1,900,000,000 acres, and of this only a little over 900,000,000 are as yet tackled by the farmer; while of cultivated acres there are only a little over 800,000,000. This leaves more than half the United States untilled. The increase during the last ten years of tilled acres is only 15 per cent. The total product of crop increase has been about 20 per cent. Meanwhile the population has increased something over that per cent.

Following the data given us it is plain that we have two things to do. In the first place we must bring more acres under cultivation; and then we must produce to the acre a much larger yield. After a century of agricultural improvement in Europe, and about that measure of agricultural waste in America, we find that the ten-year average yield of wheat in the United States is 14 bushels to the acre, while that of Germany is 29 bushels, that of Great Britain is 33 bushels, and that of Denmark is 40 bushels. This is not a question altogether of fertilizers, for there is a passion for applying commercial fertilizers now running loose in the United States. It is a problem of tillage and the prevention of waste. The farmer is just beginning to learn that conservation of the soil, and making soil, are his first and his chief obligations. He must learn how to keep what he has got and to add to it. The question of crops is wholly secondary, and farming will never be a failure where the tillage never wastes.

Careful crop rotation was the first lesson along this line, but the farmer is learning now that he must go farther and understand why rotation was necessary. It was to enable Nature to put back into the soil what

he had taken out. We shall be able to feed any population that Nature evolves, and to feed them well; and we can go on with our eugenic problem as far as we please, creating as noble a race as history and economics have ever suggested, if we follow out the instructions of our agricultural colleges. We are entering the right road. We must do a little better than Denmark with its 40 bushels of wheat to the acre. In England the average yield of wheat for fifty-five years on well-tilled farms has been 37 bushels per acre, that is, on the longest farmed lands in Europe, and the yield instead of decreasing is increasing. There is plenty of daylight ahead, and not the least show for a pessimist.

Expense of Children

Vague talk about reforms is cheap and of little value. *Increasing Home Efficiency* comes to the point in a way that should make the advocates of child culture and eugenics glad. The authors tell us that children cost three kinds of things, just like potatoes and milk, that is, brains, money and muscle. The money cost is easy to estimate, or at least the easiest. Yet what the real bargain-counter cost of children is no one seems to have determined. To get right down to the actual cost of children we are pointed to the coal breaker cities in Pennsylvania, of which we are told that "three out of every five of the babes die; but they have them insured for forty dollars each." A child costs about eight dollars a year till it is five years old, and then it sort of scratches around for itself. When it is ten it can go to work and help the family. So they insure them for forty dollars each, and if they live they have the kids to help them and if they die they get the insurance.

Alongside this estimate, which is fairly good also for other rural sections, we get the report of Rowntree, that in York County, England, every laborer who has three children must pass thru ten years when he and his family are underfed; but if he has only one they will be better fed to the extent of five shillings a week. According to this it takes two shillings and ten pence a week to keep a child in York, that is, thirty-seven dollars a year. A Nebraska farmer reports that a little daughter costs twenty dollars the first year; ten for the doctor and ten for clothes; "but I wish you could see what a beauty she is." The wife of a New England business man reports that it costs exactly $667 to provide her baby's outfit. Evidently you can place the average cost of a baby anywhere between these two reckonings. A Pennsylvania family reports that a girl fourteen years old costs $114.40 a year. Two children do not cost twice as much as one, nor do three children cost anything like three times as much. The second baby inherits a great deal.

On the other hand, one mother declares that her life has been dwarfed in raising her family. Another gives the cost of children in this way, that the parents had to sidetrack all their own ambitions to educate the next generation. To all which common sense replies, Children should be expected to coöperate with their parents in making life smoother and easier, and no social system is worth sustaining that upsets the family in training the young. Schooling should make the child more valuable as a family asset, not less. Mothers and fathers who are willing to exhaust themselves for their children are evidently unfit to be parents at all. One function of a child evidently is to coöperate with the father and mother in creating home life. We are inclined to think that the statistics offered are more suggestive than final. They will do to study, but they do not settle the question as to the cost of children. The old New England family came very near an ideal, and it was able to raise and feed twelve to fifteen children, and to educate them in home knowledge and practical wisdom, where the farms were rock

ribbed, and before science had taught us how to bring out a maximum yield in the garden, orchard or field.

In Brief

Some 7,000 of the 220,000 men enrolled in the French Army are illiterate. The review *America* blames this state of affairs on the fact that the educational system of France is no longer administered by clerics. But was there ever a lower average of illiteracy in France than to-day?

The march, or "hike," of a crowd of women to Washington in order to help the cause of suffrage is not a very bright or useful device. It is fairly innocent, better than the British suffraget way, but it will never win success, and necessarily attracts ridicule and provokes insults from unmannerly men. We hope the plan will not spread to the more intelligent and successful West.

As might have been expected, the British House of Lords has by a vote of five to one without delay rejected the Welsh Church bill. But that does not kill it, for a year or two later, if the present Government is not overthrown, of which there is no present likelihood, it can by a second vote enact the bill. The bishops in the House of Lords have led the opposition; but why should a bishop be a lord and have a vote as such?

At a dinner in this city last week, whose numbers, said to be 2500, overflowed the capacity of the hotel, Mr. Roosevelt was enthusiastically cheered and nominated for President in 1916. Again he positively opposed any reunion with the Republican party, and declared that the Progressive party had come to stay. We do not observe Mr. Munsey's name among those of the distinguished attendants.

Dr. Chalmers Mitchell asserts that, besides man, only whales, elephants, eagles and parrots live to be one hundred years of age. He gives the ages of animals thus: Elephant, 100; whale, 100; eagle, 100; parrot, 100; owl, 80; gorilla, orang-outang, chimpanzee, 70; crow, 60; rhinoceros, 60; lion, tiger, bear, 50; horse, deer, 40; goose, duck, 30; cattle, sheep, 20; squirrel, 20; canary, 20; cat, 20. Can any of our readers furnish concrete examples of unusual animal longevity? We should like to print some letters on this subject.

The young women engaged in department stores in Montreal have an organization for their mutual benefit, and they lately made a sociological study of the family relations of 2471 women employed in eleven stores of the city. Of these 30 per cent lived alone and supported themselves; the rest lived with their relatives. But 7 per cent were the sole support of their families; 60 per cent aided in the family support, and but 3 per cent worked only for their pin money or clothes, and did not aid in the support of the home. It is pretty clear that wages should not be cut on the ground that shopgirls live at home.

President-elect Wilson issues a book this week compiled from his speeches, entitled "The New Freedom," from which we take this splendid passage:

> The greatest thought one can have of freedom is as a gift that shall release men and women from all that pulls them back from being their best and from doing their best; that shall liberate their energy to its fullest limit, free their aspirations till no bounds confine them, and fill their spirits with the jubilance of realizable hope.

We hope to take this as a pledge that, so far as he can accomplish it, all Jim Crow laws which pull back men and women in certain states will be repealed, if he can accomplish it.

Lynching is an imperfect way of getting justice—it blunders sometimes. Take the case at Houston, Miss. On February 7 a woman had been killed, and ten negroes were arrested on suspicion and two white men. A mob got evidence which looked to the guilt of one of the negroes, when a mob went to the jail, "decoyed" the jailer and two deputies into a room and locked it, and then took the negro and hanged him, freeing all the others. The next day they found they had hanged the wrong man. They caught what appears to have been the right negro, covered him with tar, made a fire and burned him to death. It seems that they had been too hasty.

A prettier story cannot be found in novel or play than that of the merciful burglar of Los Angeles, told in the week's despatches. A baby was suddenly attacked with croup at midnight. As the mother went out the front door to hasten for a doctor she was met by the burglar, who ordered her to be quiet on pain of death. She cried out, "My baby is dying and I must go for the doctor." The burglar's heart was softened. He said, "Let me help you." He put his revolver in his pocket, went with the mother to the baby's cradle, called for vinegar, sugar and water, forced it down the baby's throat, rubbed olive oil on the child's chest for an hour until the spasm had past. "You must have a baby at home," said the mother. "I have five," was the reply. She makes no complaint against that burglar.

Reminiscences of Abraham Lincoln

By Gen. James Grant Wilson

[The following memorial address was delivered on Lincoln's birthday, February 12, before the New York Genealogical and Biographical Society, for a report of which we are indebted to its president, Mr. Clarence W. Bowen. The principal address was made by General Wilson; and the other speakers who had intimate interviews with President Lincoln were Henry Clews, banker, whose firm had close relations with Secretary Chase in providing funds for carrying on the war, and who told of Lincoln's career, and his mastery even over Secretary Stanton; also Col. Albert B. Chandler, Mr. D. H. Bates and Mr. Charles A. Tinker, whose service in the telegraph office of the War Department allowed them to see a great deal of the President in both his serious and his jovial moods. —EDITOR.]

It was my great privilege first to talk face to face with Abraham Lincoln in the month of October, 1858. I was visiting one of my father's friends, an Illinois judge, and he said to me one morning, "Would you like to go and see Mr. Lincoln?" I said, "Very much, Judge." At that time he was attracting the attention of the whole country by that series of famous debates with Stephen A. Douglas. The prize for which they were striving was a seat in the United States Senate. Douglas was re-elected, but Lincoln passed on to the highest place, in my judgment, that any man can occupy in this world, the Presidency of these United States.

We found Mr. Lincoln occupying a shabby, little, unkempt office, over a grocery shop. His face was rugged, his hair untidy, his arms and limbs seemed to me the longest that I had ever seen, with huge hands and feet, obviously giving little thought to the question of clothes, a sad expression on his countenance, with sad brown eyes, but at the relation of a good story by himself or another, his face would light up, his eyes would sparkle until he was positively handsome.

Something was said about his first ancestor. He said, "Well, my young friend, my first ancestor that I know anything about was one Tom Lincoln, who came over in 1634 and settled at a place, Hingham—or perhaps it was 'Hang him'; which was it, Judge?" From that we passed on to the subject of the wildcat currency which was current in the West some eighty years ago.

Mr. Lincoln said he was going down the Mississippi River on a steamboat when the pilot announced to the captain that they were out of wood. The captain said, "Well, put into the first wood pile." As the flat-bottomed boat was run up on the mud shore the captain hailed a man that he saw walking around, as to the price of the wood. "Have you wood?" "Yes." "For cash?" "Yes." "Take wildcat currency?" "Yes." "Well, how will you take it?" And back came the answer clear and distinct, "Cord for cord."

The judge mentioned that I had been telling him some curious stories that I had heard from Mr. Custis, the adopted son of Washington, whom I had recently visited. Mr. Custis stated that Washington was the strongest man of his time, and in the favorite amusement of that period, which was as popular among young men as football has been with us in the past ten years, he had never been thrown, altho he had tried conclusions with some professional wrestlers.

"Well," said Mr. Lincoln, "do you know that that is exactly my record? I have been against a good many men, and I never saw but one fellow that I couldn't throw on his back, and that was one chap, a big fellow named Jack Armstrong, strong as a Russian bear, whom I couldn't get down. But let me tell you, I took particularly good care to see he did not get me down."

The mention of Washington probably suggested to Mr. Lincoln another incident, which I shall endeavor to relate as nearly as possible in his own language.

"You know, judge, I am one of the trustees of the lunatic asylum, and I went there last week to attend a meeting of the trustees, and on

walking thru a long, chilly, drafty hall I wore my hat to protect myself against a cold, and about half way thru the hall I was rather startled by a little lunatic dashing out from a side door and drawing himself up in front of me, and throwing out his chest like a very dignified man, he said, 'Sir, how dare you presume to wear your hat in the presence of Christopher Columbus?' I took off my hat and said, 'I beg your pardon, Mr. Columbus,' and went on to the meeting. Returning half an hour later, the same little lunatic started out as I was going thru the hall, out of the same door; he drew himself up as before, but with a more haughty expression, and said, 'Sir, how dare you presume to wear your hat in the presence of General Washington?' "

Lincoln took off his hat and said, "I beg your pardon, General Washington, but, my friend, it seems to me —I have a pretty good memory—it seems to me you told me half an hour ago you were Christopher Columbus." "That is perfectly correct, sir, but that was by another mother."

Many years passed. I was in the Mississippi Valley with General Grant, and one day I received news that my younger brother had been mortally wounded in the battle of Fredericksburg. I went to the general with the news and told him I should like to have a furlough to go to Washington and see my brother in the Georgetown Hospital for officers, Georgetown being a part of Washington as Harlem is a part of New York. I called at the White House. When the President saw me he said, "Well, Colonel, what brings you to Washington?" I told him. "Well," he said, "come in this afternoon at four o'clock, and we will walk right to the hospital and see the young captain."

I went at four o'clock. I found him buttonholed by a Buffalo member of Congress whom I happened to know, who was pressing with great earnestness and excessive vigor the claims of some of his constituents for some certain office. When he saw me he looked at me as much as to say, "I wish you would take yourself out of here till I get thru." But Lincoln caught a look at that expression and said, "It's all right, John; turn on your oratory." So the member of Congress resumed, but finally came to an end, as all things must, and when he was finished the President, looking at him very quizzically, first on one side of his face and then on the other, remarked, "John, how close you do shave!" The result of that was that we all left in the best of spirits, and parted at the gate of the White House, the member of Congress going his way and we going to the hospital.

I said, "Mr. President, is that the manner in which you manage the politicians?" "Well, Colonel," he replied, "you must not think you have got all the strategy in the army; we have to have a little bit for Washington."

And that was his strategy. He did not argue with his people, but made some droll remark of that character, or told some funny story, and so he evaded the discussions with these people on the claims of their constituents. That is the way he talked to the politicians.

A few days later the President and his Secretary of State, Mr. Seward, accompanied by a young officer, were taken in an ambulance drawn by four mules, to a spot across the long bridge over to the Virginia side of the Potomac, to attend an army review; the review of a corps. Down to and across the bridge all went very well, but on the Virginia side the roads were kept very badly, were of clay, and deep ruts were plentiful, and the driver had great difficulty with his mules, and the more difficulty he had the more angry he became, until finally he lost his temper and took to swearing, which became rather unpleasant. The President leaned over and said, in his sweet voice, "Driver, my friend," and the driver turned around. The President said to him, "Are you an Episcopalian?" The driver said, "Why, no. I ain't much of anything, Mr. President. If I go

to church at all I generally go to the Methodists." "Excuse me," said the President, "I thought you must be an Episcopalian, for you swear just like Seward, and he is a church warden."

Some of Mr. Seward's friends thought they noted a little less profanity on his part than previously. Of course, that is what the President intended. He was hitting Seward over the driver's head.

And here I might remark, as being a very strange circumstance, almost inconceivable, that, growing up in that wild, rough community of Southern Illinois as he did, where the habit of profanity was almost universal, where the habit of drinking was almost universal, and where the use of tobacco was almost universal, the President never used oaths, he never drank and he never chewed tobacco. I think that is a rather remarkable circumstance. A few days later I encountered my brother-in-law one day in the street, Senator Dixon, of Connecticut, and he said, "Will you come to lunch with us today?" I said, "Is there anything particular to offer?" "Why, yes," he said, "I have a constituent from Connecticut who is six feet ten inches tall, the tallest man I ever saw outside of a show, and you know how interested the President is in any one taller than himself." I thought there would be no doubt of that. Well, we met, and for the only time in his life, or in the hundred times that I saw him, the President was flabbergasted —if I may use the expression—by the sight of this man looking down on him by six inches, so that he really could not find any language at first. Finally his face was overspread by that lovely smile of his—I think the most beautiful smile I ever saw on any man's face, and his eyes gleamed with fun as he said to this gentleman, "My friend, will you permit me to ask you a question?" "Why certainly, Mr. President." "Do you know when your feet get cold?"

I had the great good fortune to hear the second inaugural address, which is one of the gems of the language. Emerson said he thought it was likely to outlive anything now in print in the English language. As it may interest you, I will give you as closely as I can in his own tones the splendid lines:

> Fondly do we hope, fervently do we pray, that this mighty scourge of war may speedily pass away. Yet, if God wills that it continue until all the wealth piled up by the bondmen's two hundred and fifty years of unrequited toil shall be sunk, and until every drop of blood drawn by the lash shall be paid by another drawn with the sword; yet as was said three thousand years ago, so must it still be said, that "the ways of the Lord are true and righteous altogether."
>
> With malice toward none, with charity for all, with firmness in the right, as God gives us to see the right, let us strive on with the work that we are in to bind up the nation's woes, to care for him who has borne the burden of the battle and for his widow and his orphans; to do all which shall achieve and cherish a just and lasting peace among ourselves and with all nations.

New York City.

Four Score and Fifteen

By Caroline Fletcher Dole

DIMNESS of sight, and dimness of sound,
And the whitening almond tree,
Closing of doors to the streets around,
But the soul is alert and free!

Yes, the soul is alert and free,
And wanders to friends away.
Do they ever think of me,
Still here in the fettering clay?

I shall lay it down;—what then?
Shall the soul, alert and free,
Join the beloved, who have been
With God,—where I fain would be?

A Typical Uneasy Woman

By Susanne Wilcox

[This little sketch from real life gives very clearly the views held by a growing number of educated and ambitious young women nowadays. They are not averse to matrimony and maternity, as they are often charged with being. They are merely reluctant to submit themselves to the limitations and restrictions which have in the past been imposed upon married women. We wish all such "uneasy women" as happy an outcome to their perplexities as came to Kitty. The illustrations are by Maurice Becker.—EDITOR.]

I have a cousin named Kate Percefield. We call her Kitty and used to consider her somewhat erratic, anomalous perhaps; but the longer I have known Kitty, and the more I have compared her with other women I have known intimately, the more I have been convinced that Kitty is merely a little franker and more positive than most in her rebellion against many of the inherited platitudes and conventions which constrain girlhood and womanhood. In short, Kitty appears to me to be the incarnation of the unrest of modern woman—a typical "uneasy" woman.

The prime factors governing Kitty's life seem to be a desire to live freely and frankly and an unbounded curiosity to learn about everything, great or small; yet from early childhood she conceived herself thwarted at every turn. For each fresh impulse there seemed always to arise a fresh restraint.

Kitty has two older sisters, May and Alice, and a brother Tom. It was perhaps unfortunate that Kitty and Tom were so nearly the same age and temperament. Tom was a dashing lad, and whenever he chose he "dashed." At a very early age he was well aware of his superior sex advantages, and seemed to enjoy flaunting them at Kitty. Whenever he wanted to monopolize a situation at play he would invariably remind her that certain privileges were not for girls. To all of which Kitty stoutly rebelled, and as she grew up her rebellion took deeper and deeper root.

"Tom may laugh and shout to his heart's content, Cousin Susanne," she would complain to me; "Tom may climb trees, go barefooted, and kick up his heels any old way, and no one objects, but let me try anything of this sort and there's always some one on hand to remind me that I am a girl, that I must be a lady. The older Tom grows the more rope they give him; the older I grow the less they give me."

In a word, for Tom life appeared to be freedom, opportunity and inspiration in all he undertook, while for Kitty life appeared to be a series of restraints and negations, and the key to it was, Don't. Even the sports and duties allotted to her seemed mostly dull and anemic compared with those permitted to Tom.

At first Kitty vented her sense of injustice to her parents, but she soon learned that this was futile. Her mother was a mid-Victorian type who accepted her role of servitor in her family without question, tho she often found it dull, heavy and monotonous. Her girls she wanted to be ladies, care-free and ornamental, nothing more. Such a life she felt certain would insure them happiness.

The father, on the other hand, was a convention-bound master—a man who believed in himself and in all his prejudices of sex, of political, economic and industrial conditions. He believed in all the recognized restrictions for women and in the natural superiority of men and their divine right to keep the management of the best and most important affairs of life in men's hands. He always voted the straight Republican ticket; believed that the poor must always be with us and a little charity given freely covered the sin of paying low wages; also, in the infallibility of the Constitution and all other established conditions. To him, men or women who advocated radical changes or re-

forms were very dangerous fanatics. So Kitty soon learned that her protests in the household only reacted upon her own head, since they merely augmented the family antagonism to all her convictions. Why was she not content and happy like other girls? Why did she not accept her superior privilege of being protected and provided for all her life, as other girls did? were the unvarying retorts.

Meantime Kitty took to thinking in silence and concealed her dissatisfaction, since it availed nothing more than to stir up contention in the family. Secretly, however, she resolved to take her life into her own hands. If she could not emancipate herself openly and frankly, then she would do what she could subtly and covertly —woman's old way.

But she soon saw she had set herself no easy task, and for years her struggle and unrest were unremitting—the disruption of many of her early faiths, ideals and sentimentalities; the yearning for courtship, love, wifehood and motherhood, coupled with a settled distaste for the aftermath of marriage with its dull, purposeless, cramping domesticity, as she had observed it closely and intimately in the lives of her two married sisters, all contributed to her unrest. Furthermore she had resolved to have a career of action, initiative, and a hand to hand encounter with life, even tho she married. Yet with all the inherited iron-bound traditions against it, how could her desires be consummated? At best the scheme of a girl's life seemed foreordained

"KITTY'S SISTERS HAD AN ABUNDANCE OF LEISURE."

to be incomplete—to be dry, fragmented and unsatisfying outside of marriage, even tho one had a career, and to be detached from actual life and forced to virtual isolation from all men, except the husband, within marriage.

Both of Kitty's sisters were considered well and happily married. Their husbands kept them in comforts and luxuries, which they accepted as a matter of course. They had children, yet they had an abundance of leisure which they spent mostly in making dainty, useless frills for the little ones, and in innocuous club work, teas and card parties. They were also active in one of the city churches and found much satisfaction in applying their talents for organization and business—talents which they undoubtedly possessed—in church bazars, entertainments and rummage sales.

"But, Cousin Jane, is all this life?" Kitty would exclaim. "It seems to me such women as May and Alice are mere amateurs playing at life, and live on a constant diet of whipt cream and blanc mange."

Tom, on the other hand, as he grew up, struck out boldly to make himself a real live atom in the scheme of things. The world and all it had to offer—politics, art, power, domestic, economic and industrial activity and experience were all grist for his hopper. While May and Alice were occupying their lives mostly with desultory pastimes, Tom was soon deep to the neck in actual affairs—leading the local movement for clean politics; equipping the Duffield umbrella factory with safe and sanitary mechanical appliances, and gradually instituting a juster economic management, in spite of his father's opposition. His leisure he spent mostly in playing golf, tramping, or in exchanging ideas with other live, wide-awake men.

"TOM WAS SOON NECK-DEEP IN ACTUAL AFFAIRS."

As Kitty observed and contrasted the lives of her sisters with that of her brother, her rebellion did not diminish. Why could she not strike out as Tom had done? Go fishing, hunt-

ing, or traveling alone if she chose; have a serious occupation, be economically independent, and enjoy courtship and marriage as well? For Kitty these were persistent and perplexing queries.

"Oh, Cousin Jane, why was I born a girl?" she would protest bitterly. "Oh, to go adventuring, to be a cowboy, or go exploring, or prospecting for gold, or even for just plain unhampered experience! This contemptible double standard of life, of morality, of money matters, of experience, of everything! There's no justice in it!"

In brief, as Kitty thought and developed she seemed to ride higher upon this wave of unrest and discontent. Yet for the most part she carefully concealed her dissatisfaction, appeared to be ashamed of it, to fear the disapproval of her girl friends who seemed content with the established order for women. By and by, however, she began to discover that many of them were also secretly chafing under the restraint and paucity of social and economic opportunity.

But while Kitty shrank from the disapproval of women, she winced under the scorn of men. She enjoyed her men friends and they enjoyed her chiefly because she could be good comrades with them. Yet seldom did she venture to raise her voice against their fossilized ideals and flimsy sentimentalities concerning womanhood. Well she knew that by a little dissimulation she could hold their admiration and by a little candor she would lay herself bare to being considered erratic and even unwomanly.

Meanwhile she resolved to have a serious pursuit in life. At college she specialized in journalism, and when she returned home she obtained a position as society reporter on *The Leader*. This she did in the face of the severe opposition of her family and of many of her friends, who could not understand why she should wish to have a strenuous occupation when she might live care-free and in luxury at home.

But Kitty soon wearied of reporting the society life of the community and gradually extended her reporting to slum life also. At the same time she extended her interest and friendships to all sorts and classes of people; and always she maintained she would remain a foot-free spinster, willing to forego the romance of life, rather than submit to the dull, cramping restraints of marriage.

At length, however, there came to our town "a man after my own heart," Kitty proclaimed him—a young Unitarian minister, fresh from college. A strong, wide-awake man of progressive ideas and with courage enough to advocate them publicly. As Kitty and The Reformer, we called him, grew to be good friends, she stirred him on to attack various disgraceful local grafts, tho some of the grafters sat regularly in his pews; to attack the wretched slum tenements, tho some of the owners sat also in his pews. And as I contemplated their good comradeship, my mental comment was that at last Kitty had found her ideal mate. Presently I began to twit her on her dying chances for "foot-free spinisterhood." Yet always she seemed a little reticent, a little uncertain about The Reformer, tho in time she acknowledged that they were virtually engaged.

Then, one day, she came to me pas-

"KITTY WEARIED OF REPORTING SOCIETY AND EXTENDED HER REPORTING."

sive as a lamb apparently, but her back seemed to have an extra stiffening and her eyes glistened with anger.

"Well, it's all over, Cousin Jane!" she announced as she flung herself into an armchair, her voice breaking.

"All over! What's over?" I inquired, alarmed at her manner.

"The possibility of my ever marrying our progressive friend—The Reformer!" she replied with much feeling.

"Bosh!" I retorted. "You know you have enjoyed The Reformer's courtship and friendship more than anything life has ever given you, and of all the men of your acquaintance does he not come the nearest to being your ideal of what a man should be and stand for?"

"Yes, I thought so. But I've just discovered, in spite of his progressive egoism, he will go only so far as is securely popular. And in matters concerning women he's as hidebound and belated as if he belonged to the dark ages."

"But why did you not keep your advanced ideas on the woman question in the background? Hitherto you've been cautious enough about airing them!"

"Because I thought the one man to whom I must be frank and honest was the man I intended to live with and work out my salvation with perhaps for the rest of my days."

"Do be more explicit," I urged impatiently. "Just what does he object to?"

"To everything I value most."

"But that's not being explicit."

"Well, he insists that I must give up all this comradeship with men"—in other words, my friends, my correspondence with several schoolfellows whose friendship I prize. But worst of all, he demands that I give up my work and become strictly domesticated like other women; that even tho his salary is small and he is still burdened with college debts, we must skimp and manage upon his income merely because Public Opinion demands it. In a word, he objects to my having an occupation because Public Opinion objects, and he is willing that I become his domestic servant because Public Opinion does not object."

"Well, is all this more than other men demand of the women they marry?"

"No, but it's precisely what I'll not submit to," she snapped, a hot flush mounting her cheeks. "My vocation, which insures me pleasant, useful work and insures independence, is as important to me as his to him!"

"It can't be that you love him, Kitty, or you'd gladly give up everything to him."

"It can't be that he loves me or he'd gladly compromise upon this one point. I've offered to surrender on all else—men friends, interesting correspondence with old schoolfellows, to keep house, interest myself in his work, to have a family, anything, if he will only permit me to devote a few hours a day to my own work. This could easily be managed, since they are quite willing at the office that I cut my work down and retain only part of it. But no, The Reformer says it can't be done. There's quite enough in his work with which to occupy my mind; that all a woman needs outside of love and housekeeping is something with which to occupy her mind. The truth is, what he plainly proposes is to think for me, direct my life and action, take possession of me, body and soul, as soon as he marries me! Oh, no, Cousin Jane, my soul at least must be my own, and a little freedom of action. I should hate the man within a week if he took such absolute possession of my whole being."

"Be reasonable, Kitty," I pleaded, "you know very well that if he didn't demand your leisure his congregation would."

"What right has his congregation to demand my leisure?" she retorted defiantly. "Do they employ me? Must I give up a serious occupation for which I have spent years in preparation, in order to spend my time at teas in exchanging nonentities with

a lot of convention-bound people with whom I have little in common, with whom you know well I could never be myself, never express my sincerest convictions?"

"O, Kitty, do be sensible, and don't spoil a good match just for the sake of riding your hobby."

"Cousin Jane," she replied rising, her face set as marble, "there's no use in prolonging this dispute. It's better to spoil a 'good match' than to endure a miserable marriage. I might do for a real reformer's wife, but not for a preacher's wife!"

From that day on Kitty continued with her work. For a time she seemed a little paler, a little more subdued; but this experience seemed to have given her greater force, more sympathetic tolerance. She seemed also to strike deeper at the root of things and to gain courage in defending her convictions, and in deprecating the subtler, less obvious shams of life. Meanwhile several years passed by and as Kitty appeared to become more and more absorbed with her work, I concluded that she was securely destined for "foot-free spinisterhood."

Then one day she came to my house again with a manner importing unusual agitation. Again her deep brown eyes glistened, tho not with anger and disappointment.

"Cousin Jane," she laughed jauntily, "I'm going to be married."

A bolt of thunder from my drawing-room walls could not have startled me more!

"Married!" I exclaimed, "Who on earth have you found, Kitty, who will put up with your notions?"

"A Reformer again!" she rippled on sweetly. "But an all round one this time; one who believes in women, who believes in me, who will permit me to be myself, to have my own individual interests, who will not demand that I keep house, sew on buttons, have babies, be economically dependent upon him, or be a household servant unless I choose to. All he asks in return is that I allow him to be himself, to carry on his work in his own way and still be his friend and comrade, even tho he be commonly denounced as visionary, radical, fanatical, etc."

"Kitty," I retorted, "no such man exists in real life. Who is this being who has so thoroly deluded or hypnotized you?"

"John Cripmann, the assistant editor of *The Leader*."

"O o-o-o," I drawled in a long, easing breath. "That visionary enthusiast! Well, see to it, Kitty, that you stick to your bargain. You're almost a spinster, you know, and terribly set in your ways. And if I judge him rightly, Mr. Cripmann has a few convictions of his own, and is quite as set as you."

"Yes, but most of his convictions hitch up pretty well with mine. And now that I've found a man who doesn't propose to own me body and soul, I myself thought I should begin by making a few concessions, so I told him we'd have a nest we could call home, and some babies, and if I could manage to go on with my work, well and good, but if it kept us leading too strenuous a life, I'd give it up. And what do you think he said? 'No, Kitty, your work on *The Leader* is quite as valuable and important as mine. If you get half the satisfaction out of it I do out of mine, you've a right to keep it, and keep it you shall. We'll manage the rest somehow, and if you're willing we'll have the nest and a few nestlings, too.'"

"Well, I vow!" escaped me, "John Cripmann is certainly queerer and cleverer than I ever dreamed!"

Nursing the Turkish Soldier

By Miriam Hathaway

[This article, just received from the Professor of Mathematics in the American college for women at Constantinople, is even more timely than it was thought to be when despatched, for the war has broken out with increast violence and again there is need for woman's nursing within the Tchataldja lines.—EDITOR.]

"Yes, we should be glad of the help of two or three women, even if they aren't professionals. Can you come over tomorrow to take charge of Mary?" For an instant I felt as if I were being engaged as a nursemaid, but "Mary" was no child with flaxen curls and big bows; "Mary" was a small ward in the hospital which the British Red Cross had fitted up for the care of wounded Turkish soldiers.

When I was first introduced to the ward there was slight resemblance to the rows of neat little white beds one thinks of in connection with a hospital. There had been unavoidable delays in the arrival of supplies, with the result that the beds were somewhere between Marseilles and Constantinople; consequently the patients were on mattresses on the floor. That was inconvenient, but I think the patients minded less than anyone else, for the Turkish peasant does not ordinarily sleep on a bed. When the beds came some of the men objected to using them. One was afraid he would fall out while asleep, and another said if he slept in a bed it would make him so soft that he could not go back to fight the Bulgars at once.

No Turkish scene ever lacks color, and the ward was no exception to the rule. It gets cold in Constantinople in November, so each bed was supplied with a yorghan (bed quilt) in addition to gray blankets. Yorghans are usually made of stuff of the true "Turkey red," and the men always protested if a dull blanket was put outside of a vividly colored quilt. Anyone who has seen the Turks in cold weather knows their fondness for tying handkerchiefs around their heads. In the hospital the fezes were replaced by round caps of white cotton, but the men were unhappy unless they had these caps tied on securely with their colored handkerchiefs. Ali's round, quizzical, black-bearded face was unusually crowned by a white cap with a bright blue handkerchief tied in such a way that the ends stuck out like two horns from the exact center of his forehead. He learned some phrases of English without fully comprehending their meaning, and the effect was irresistible when he beamed at me under his blue horns and announced, with faultless accent: "I am a lun-a-tic."

My dozen patients were all Moslems from Asia Minor, of whom only one, the "hodja" (teacher), could read or write. I never found out how old they were. When I first saw them I said they were all middle-aged, but as they got rested and began to show the effects of good food at regular hours, they looked younger, and after the barber's visit I decided I was probaby mistaken in thinking any of them was over twenty. They had been wounded in those first disastrous engagements of the war, at Kirk Kilisse, Lule Bourgas and Tchorlu, and then swept back with the retreating army. They had received "first aid" treatment but nothing else, and in the breakdown of the commissary department they had suffered keenly from the lack of food. The interval between the time a man was wounded and the time he reached the hospital had been almost three weeks in many cases. Practically every man in the ward had dysentery when received, and their wounds were very badly infected.

It is unnecessary to give many harrowing details, but a description of two or three cases will illustrate the seriousness of the wounds and the

patience and endurance of the men. In the corner lay a red-haired man from Samsun, a handsome fellow, with a fair, white skin. He had been in the cavalry. A saber had slashed across the back of his right hand, severing all the tendons just below the knuckles; then he was pushed off his horse onto the waiting bayonets. He had two bad cuts in his head, seven down his back and one long one on his shoulder when I first saw him. Those were the wounds which had to be drest; other slighter ones had already healed over. In order to be comfortable he used to lie in the strangest positions I ever saw a human body twisted into, but he never complained or showed any signs of impatience.

Hassan was an older man. One bullet had broken his jaw and another had gone thru his shouder, shattering the shouder-blade. How he managed to do as much for himself as he did was a wonder to me, but he asked for very little assistance, except to have the covers moved when he wanted to sit up or lie down. In spite of his bad jaw, he succeeded in eating fairly large amounts of semi-solids. He had great ability to sit still and do nothing. If you can imagine Buddha sitting cross-legged on a mattress, with a white night-cap on his head and a bright red yorghan over his shoulders, you have a good picture of Hassan.

When Vali came in, the most optimistic surgeon said he couldn't live twenty-four hours. A large, heavy bullet had hit him in the chest, breaking four ribs and tearing the lung. When he was received the bullet was somewhere under his ribs; he was raising very bloody sputum, and every time the external wound was uncovered it discharged great quantities of pus. In spite of all gloomy prophesies Vali not only lived twenty-four hours, but gradually got well. The bullet worked out from its hiding place, and I have seldom seen any one more proud and excited than Vali when he first realized that he could feel it where it lay imbedded in the muscles below his shoulder-blade. He could hardly wait for the doctor to cut it out.

These are typical cases of the men received when the hospital was first opened. Those who came later from Tchataldja had cleaner wounds, but they were fearfully torn by the shrapnel.

I had never expected to feel much respect or personal liking for the common Turkish soldier, but these patients commanded both. As most of us who were caring for them could speak only a few words of their language, they were lying ill and wounded in a place the like of which they had never seen before and people who must have seemed to them unaccountably stupid because they could not talk to them, and yet they were ready to carry out all orders which they understood; they were most considerate, and almost too uncomplaining.

The mere fact that they had lived to get to the hospital at all proved their phenomenal endurance, but they gave proofs of it in other ways as well. In spite of their wounds they seldom ran high temperatures, and only one or two were restless. One day, hearing an unexpected sound behind me, I turned my head to see what was happening. Sadik had wrapt himself in his gray blanket and started on a walk around the room. As he had a badly shattered forearm and a bullet wound thru the body at the waist line, I was alarmed. Before I had fairly caught my breath, Bekir—he of the dozen bayonet wounds—picked up his blanket and started to walk, too. I expected to see the broken leg cases start next. One turn around the room satisfied Bekir, but Sadik made three before I could get him to bed—and he wasn't any worse for the experience either.

I was never able to define my duties exactly. I had "general oversight of Mary," but a doctor and a dresser cared for the patients' wounds and an orderly did most of the heavy work. I kept busy twelve hours a day doing odds and ends. One

of my most strenuous duties at first was giving out the food at mealtimes. When a man is convalescing from dysentery there comes a time when he wants to eat everything he sees, and he is perfectly willing to risk being made sick by anything which looks good. Add to that natural tendency of all men the fact that many of these had too often in the past seen the supply vanish before they were satisfied, and no one can wonder that each clamored to be fed as soon as the food came in from the kitchen. Those who were on a milk diet wanted cabbage stew, and those who were able to eat cabbage wanted some of the "yoghourt" (a preparation of sour milk) which was reserved for their feebler brethren, while everyone wanted about half a loaf of the brownish native bread *immediately*. More than once I was reminded of a menagerie at feeding time, but after a few days they understood that there was enough food for all and that I couldn't give it to every one first.

I am firmly convinced that one reason so many of these men recovered was their habit of absolute temperance. Mohammed forbade the use of liquors, and the Moslem peasant respects that prohibition, however much his higher class brother may evade it. The soldiers of most "civilized" countries are not noted for their abstinence, but my Turkish patients never exprest a desire for anything more stimulating than tea. One man who was dying of double pneumonia absolutely refused to touch the brandy the doctor prescribed

On the other hand they wanted unlimited cigarettes. The Turkish tobacco, even of the cheapest grades, is mild, so they were allowed to smoke all they wanted to. They also had a passion for anything sweet. They used to tease for plain sugar and water, and once or twice a day I doled it out to them right around the room. One man, tho, refused some sweet chocolate on the ground that his taste was getting spoiled for the food he would have to live on when he got home.

They were a strange mixture of the adult and the child, as peasants often are. One night Sadik was begging for something he could not have. At last I said to him in my few words of Turkish, "Sadik, you are a baby." Sadik rolled his big brown eyes, smiled at me most winningly and cheerfully agreed. "Yes, I am a *big* baby." What was one to do with a man like that? And yet this same Sadik has to support the families of five widowed relatives.

I suspect that "sticky fly-paper" was a new thing to most of them, but they were quick to appreciate its advantages. It might have given some foreigner a new idea of the "unspeakable Turks" if he had looked into the ward one unseasonably warm morning and had seen the excitement which reigned because of a fly-catching contest. The contestants couldn't get out of bed, but were trying to shoo as many flies as possible onto their pieces of sticky paper. Seventeen was the highest record when the dresser came in to begin his work, and the contest had to close.

In the past one has read much of the fierceness of the Turkish soldier, of his cruelty and inhumanity. What he may be in battle I cannot say. I have never seen him there and I hope I never shall, but as a hospital patient the testimony of all who have helped to nurse him is that he is remarkably easy to care for and exceedingly appreciative of all that is done for him.

Constantinople.

University Study of Recent Literature

By J. W. Cunliffe, M.A., D.Lit.

[The proposal here made that the books of the present day may be studied in the university as well as classical literature will seem to shock many an old-fashioned teacher, but Professor Cunliffe does not speak from theory only when he makes the startling suggestion that Arnold Bennett and H. G. Wells are as much deserving of attention as Henry Fielding and William Congreve. He conducted courses in modern literature with great success during the six years he was at the University of Wisconsin, and now as head of the department of English in the School of Journalism of Columbia University he has an opportunity for the further development of this form of literary study.—EDITOR.]

University study of recent literature is so contrary to academic tradition and practice that one has to begin by answering objections. One objection which I should regard very seriously if I thought it well founded is that such courses would be too easy. But by the study of recent literature, I mean "study" and "literature,"—not the careless perusal of the "best sellers" of today or yesterday. Modern philosophy and modern science are no easier than Plato and Aristotle, both of whom could give points to Darwin in literary form and the arrangement of material; Huxley, and William James, and Bergson are literary artists, and all the more worthy of attention on that account; but they are not generally regarded as light reading. Among the leading authors of poetry and fiction of recent times, there is a striking eagerness to tackle the difficult problems of modern civilization and a growing richness in intellectual content. If one does not find sufficient mental exercise in the novels of Mr. Henry James and of George Meredith, one can always turn to Meredith's poetry, which seems to me difficult enough to satisfy the most ardent longing for intellectual gymnastics. To decide whether Mr. Bernard Shaw is a serious reformer or merely a cynical scoffer at established institutions calls for some intellectual effort, and it requires still more to make out what is his program of social reform, if the conclusion be reached that he has one. Mr. Arnold Bennett and Mr. H. G. Wells would give food for thought as well as entertainment to an inquiring mind, and it needs no little critical acumen to discover whether Ibsen was a philosopher, or an artist, or both. The student of Romance languages will find as difficult stylistic problems in Guy de Maupassant and Anatole France as in the chansons de geste or the fabliaux, and the novels of D'Annunzio and Fogazzaro offer a field for study no less rich than the Decameron. Sudermann and Hauptmann may not be equal in literary value and significance to Goethe and Schiller, but they are at least as worthy of attention as scores of the authors on whom German dissertations are written. I am not suggesting that the older authors should be neglected. I simply urge that the more recent ones should not be denied serious study merely because they are recent.

Allied with the objection that recent literature is too easy is the suggestion that courses in modern fiction would be too popular. There is a legend—I do not know how true—that such a course in an Eastern university had to be discontinued because it proved too attractive and diverted the sportive undergraduate from more serious and solid studies. I have already suggested that a course in modern literature need not be—nay, ought not be—"a snap," and if it is made so, the responsibility lies with the professor, not with the subject. Almost any study, except differential calculus, may be brought down to the kindergarten level, if the teacher has not sufficient respect for himself and for his subject. The fact that a course is attractive to students is not of itself damnatory. In our fight against the Philistines we need to use the best weapons in our

armory. The day of miracles is past, and it is mere foolishness for us to attack the Goliath of materialism with a sling and a few pebbles from the brook. American youth is not to be altogether blamed for its eagerness for something that will touch present day issues, and deal with life under modern conditions. The student needs to know the past, because the past explains the present, and the great works of the past have, of course, an abiding value; but we need to be on our guard against the spirit of antiquarianism—the tendency to reverence the past merely because it is centuries old. The classical curriculum which the study of modern languages has to some extent supplanted failed—in so far as it did fail—mainly on this account; and the teaching of modern languages will share the same fate unless we justify ourselves by the intellectual stimulus we impart, either by opening the minds of our young people to new ideas or by stirring them to the admiration of artistic excellence.

Some will urge that recent literature—especially fiction—offers unsuitable food for the youthful mind, and is likely to bring the teacher into collision with the student's parents or pastor. No doubt it will, if the teacher does not exercise discretion, but this difficulty is not peculiar to modern literature. I have heard of parents who did not regard *Tom Jones* as suitable reading for girls, and I remember a student who after reading one of Congreve's plays remarked that she had not received much moral uplift from its perusal. Some of you may have read in the newspapers of the decision of a Chicago high school class that Shakespeare was an immoral author, and their request that he should give place in the list of studies to Ella Wheeler Wilcox. But when it is noted that the Shakespearean work chosen by the teacher for class study was *Venus and Adonis*, my readers will agree with me, I think, in blaming the teacher and not the unfortunate children who had been committed to his care. But it is not high school study I have in mind, nor even college freshmen classes, but seniors, and above all graduate students. Modern literature cannot be understood without a knowledge of literary history, and I am very far from advocating the study of the modern period to the exclusion of all else. Students who have gone thru unexpurgated editions of our older dramatists will not find their sensibilities shocked by the frankness of modern fiction.

A more serious objection, to my mind, is that the study of recent literature, while it may be made easier for the pupil, must be more difficult for the teacher. The older authors, it is argued, have a recognized position, and the judgment of posterity about them is sure. *Securus judicat orbis terrarum.* The reputation of recent writers is necessarily more unstable. Just because a man appeals most directly to the tastes of his own generation, his permanent fame and value may be in inverse proportion to his popularity in his own lifetime. All this appears to me to be true, and it leads to the conclusion that the direction of such studies should be in the hands of unusually competent and experienced professors. These are edged tools and should not be placed in the hands of raw apprentices. Graduate students who wish to take recent authors for investigation should not be discouraged; they should be encouraged if their ability is at all proportionate to their ambition; but it is only fair to warn them that of all fields, the modern field is the most difficult. It demands more knowledge and more independent judgment than any other, and does not lend itself to mechanical investigation; it brings the student who publishes his dissertation into competition with the professional critics and reviewers, the best of whom, in our day, have often special knowledge as well as long training. By way of partial compensation, the excellence of much of the critical work publisht in the contemporary press makes the task of

appraisal and investigation easier than it was a generation or two ago. Elaborate biographies of leading authors are given to the world immediately after or even before the deaths of the subject, and books of interpretation, comment, and criticism publisht during the author's lifetime are much commoner than they used to be. The publications of the London and Boston Browning societies, and the numerous volumes about Ibsen, Stevenson, Hardy, and Meredith are cases in point. The material is abundant, and often bewildering in its abundance. The student needs a ripe judgment and full knowledge to save him from being swamped by the sea of eulogy or from being driven hither and thither by the contending currents of contemporary opinion.

After giving full weight to the main difficulties involved, I come, nevertheless, to the conclusion that recent authors may be introduced, with proper safeguards, into the work of our advanced classes, and may with advantage be made the subject of graduate research. Some of the fields in English show evidence of over-cultivation; the Elizabethan soil, for instance, seems to me to be wearing thin. I welcome the tendency of recent years to direct attention to the nineteenth century and more especially to the latter half of it; but I discern an inclination to concentrate attention on the earlier Victorians, who are perhaps expected to appeal to the students because they appeal to their teachers. Nothing could be further from my intention than the depreciation of the Victorian age, for it began many of the literary and intellectual movements which are now bearing fruit, and its actual achievements were of high value and significance. But it was not, as some seem to regard it, the end of things, and I see no reason why literary investigation and interpretation should stop there. On the contrary, it was an age of compromise and transition, and can be rightly studied only in its own setting in the history of art and thought. Thackeray and Dickens, Browning and Tennyson may be very well suited to students who have come from somewhat remote country districts, but to the young people who have grown up in our great centers of population they present already an organization of society and a way of thinking that belong to the past. It is the immediate past, and our civilization rests upon it; but its point of view is very different from that of thoughtful youth in the present day. In some ways the Elizabethan age, with its spirit of enterprise and inquiry, its sense of a new world and of an old world seen with new vision, is nearer to our own time; and it may be that the age of Pericles, if we could really bring our students into contact with it, would be nearer still. Certainly the gulf between this generation and the last is one of the greatest in human history, and there are signs that our students are sometimes more conscious of it than their teachers. In these days of libraries and newspapers, a new writer obtains a hearing, even in remote villages, with astonishing rapidity; we live in an age of electrical transmission of thought as well as of persons and commodities. The young people who do not come into contact with modern ideas, if such there are, are dimly conscious of them, and are eager to enter into their inheritance. In the welter of reading matter pouring from the printing press they need direction. We shall not guide their tastes aright merely by pointing them to what is of acknowledged excellence in the literature of past ages. They have their own lives to live, their own problems to solve. I do not mean, of course, that the professor of literature should become a propagandist; the less his personal opinions and predilections enter into his judgment the better. The student should, and in my opinion will, form his own opinion of Bernard Shaw, just as he forms his own opinion of Ben Jonson, when he can be induced to make acquaintance with him at first hand. With modern authors there will be far less difficulty in securing a knowledge of

the text and an independent opinion based upon that knowledge. The professor's part will be the setting forth of known facts and the application of the principles of scientific criticism to questions of literary workmanship. I am not blind to the difficulties, especially for young students; but the advantages to be gained are manifold. The study of recent authors will give a sense of vitality to literary investigation, which is in itself a great gain; and there is no lack of authors or of movements that are worth investigating. Not only on the material but on the spiritual side, the civilized world has passed thru some of the most remarkable changes in its history during the last fifty or sixty years, and if we fail to make our students acquainted with them, we shall fall short of our educational opportunity and of our professional duty.

New York City.

Applied Doctrine

By Mella Russell McCallum

Were I a hooded monk in a monastery gray,
I'd open only half an ear to what folks have to say.
I wouldn't be deciding what was right and what was wrong,
Unless the provocation was unusually strong.
(Oh, dear, who's coming down the street! It's Genevieve Jerome.
I think it's something scandalous the time that girl gets home.
Of course, I know she works long hours, but it really looks to me
'S if she flirted on the corner with that Mr. Saterlee.)

Were I a hooded monk in a monastery gray,
I wouldn't always shake my head in horror and dismay
When I saw folks getting tangled in their frail domestic life.
I'd remember that they's human, and that man was born to strife.
(Oh, dear, it fairly drives me wild, the way my neighbors scrap.
Will you believe it—sometimes I can hardly get my nap!
They'll fight all day about a penny button on a blouse.
I really wish they'd get divorced, or rent another house.)

Were I a hooded monk in a monastery gray,
My heart would be compassionate toward all who went astray.
I'd credit them with struggling with all the strength they had,
For you never know the real truth and temptation's mighty sad.
And most o' the awfully good folks never want to be real bad.
(Oh, dear, there's tales and tales going around about May Lee.
And I'm afraid they're partly true, for she's wild as she can be.
To think a Christian neighborhood should have that dreadful smirch!
I almost hope that Elder Doane will put her out the church.)

Were I a hooded monk in a monastery gray,
My heart would beat for all the world, my lips would ever play
Lest I set myself above folks, in ignorance of their sin,
Lest, safe within my sheltered nook, I shut the door and din,
"Go right away, you sinful soul—of course you can't come in."

Waterville, Ont.

Independent Opinions

What the Editor Finds in His Morning Mail

The first and most exciting event in the editor's day is the opening of the morning mail. Will the envelope just taken in hand contain an article from that undiscovered genius for whom all editors long? Will it give information of value to us in the writing of editorials, or in the getting of contributions, or will it ask for information as to names, addresses, dates, statistics and historic facts, or advice on what arguments to use in a debate, what college to attend, what bonds to buy, what insurance policy to take out, what books to read, and all the other things that an editor is supposed to know, but generally doesn't until he looks it up? Does the letter contain a helpful suggestion as to possible improvements in the magazine, or does it call attention to a typographical or grammatical error in the last number which has already caused the editor to tear his hair, now getting all too scanty at best?

At any rate the editor's mail is interesting and he welcomes it all, the complaints as much as the compliments. He has, however, one fault to find with his correspondents, that is that their words of praise, while encouraging in a general way, are apt to be vague, while the criticisms are usually specific, often painfully so. The reason why letters and lots of them are useful is because the editor is really working in the dark. He is like a nearsighted man addressing an audience too polite to interrupt him with cheers at any particular points. He has no way of knowing whether he is pleasing his auditors or boring them unless they walk out in large numbers or begin to throw things at him.

But better than to talk about our correspondents will be to print a few letters, or rather extracts from letters, as in most cases it must be. We will begin with a note from our new publisher, Mr. French, which came to our desk with other memoranda in the routine of business:

PUBLISHER'S OFFICE.

Editor:—I have had it in mind to collect for you the letters we have been getting from our readers, referring to the change of ownership and our efforts to make a more readable and handsomer magazine, but I find it impossible to do so for the reason that there have been so many of them, distributed among the different departments, that to attempt to collect them would now disarrange all the files in the office.

These letters have been coming from all parts of the country and from all classes of readers. More than 99 per cent of them express cordial approval, especially of the new dress of type and the new arrangement of the departments. All of them breathe a spirit of fraternal interest and regard. It is this atmosphere in which they are all evidently written that has especially appealed to me.

I am an ardent INDEPENDENT man, of course, and I read and reread every copy. First I read it exactly as another would, for the good stuff it is always filled with, and then I read it two or three times for the purpose of finding fault with the editors, writers or printers. I reread some of the articles just because I delight in their literary flavor, or in the skill with which they present their subjects. But I am not in the class with these readers who write letters to us. I would willingly give $100 if I could read any periodical with the zest our readers betray in their letters to us. We who are condemned to periodical work lose some of our enthusiasm for pure literature. We are forever looking back of the written words for the split infinitives, or some other errors into which writers are prone to fall; we are computing the number of words in an article instead of giving ourselves the luxury of *reading* it.

Hardened and blasé, so far as periodicals are concerned, and weighted with the strenuous labors of making this one, I am more touched and affected by these letters that come in every mail than I can tell you. I am certain that there is not a periodical in the United States that has a constituency more loyal than ours, or more genuinely interested in their magazine. I hope there are

some that are as fortunate as we are, but I have yet to know them. I can now understand why we get such a large percentage of renewals every year, and why it is that our circulation is so valuable to our advertisers. Our relations with our readers are certainly ideal. I wish all the writers of good letters to us could know how inspiring they are, what incentives to better work, what a real help they are to us in the business office. Can you not frame an editorial paragraph that will let them know how we feel, and how they are helping to make THE INDEPENDENT? G. F.

JANUARY 17, 1913.

To the Editor: We have kept house for almost fifteen years and THE INDEPENDENT has been a weekly visitor long before the Man of the House used to take it and pass it on to me. We long ago decided that if we could have but one of the many magazines which had a place on the library table it would be THE INDEPENDENT. But we never dreamed that such a choice must be made some day, nor, worse yet, that even it had to be given up. The old story of unwise investments, of business complications impossible to adjust, the failure of my health, proved the old proverb to be true—*facilis descensus.* The pretty home with its flowers and trees is changed to a buffet apartment on the fourth floor in a smoky city district, but it is clean and the sun shines in and the spirit of love makes it home.

Some marvels of darning on my part, and of cleaning and pressing on a loyal tailor's part, made the Man's wardrobe fit to go thru the winter and we decided to send for magazines with the savings. THE INDEPENDENT came first, in its new dress, and your editorial made me smile. When a dear old friend is a guest for the first time in over a year, dress does not make much difference, yet because of love for the friend we're glad to see a fitting and becoming garb, to be able to say "You are looking better than I ever saw you look."

We are beginning to climb back slowly up the ascent down which we coasted so fast, and every day brings renewed strength and health to me, and so we hope that we shall never have to miss THE INDEPENDENT another whole year. A FRIEND.

Such a friend is a friend indeed, and such a letter makes the Editor feel both proud and humble all at the same time.

DORCHESTER, Mass.

Dear Mr. French: In replying to yours of November 29, I address an unfamiliar name, and mine will be an equally unfamiliar one to you, tho not so to THE INDEPENDENT, as I have been a reader of it from the very beginning of its existence, and with a brief interval, a paying subscriber. During sixty-four years, from the days of the primitive editors, Drs. Bacon, Leavitt, Thompson, and other veterans, I have looked week by week for THE INDEPENDENT as regularly as for my own Church papers; for during all those years, and several years before, I have been a minister of the Methodist Episcopal Church, now at ninety-two years of age, retired. M. J. TALBOT.

UNIVERSITY SETTLEMENT, NEW YORK.

The editorial in your issue of January 23 on "Is It Crime as Well as Sin" was most timely and puts THE INDEPENDENT in the front rank of social service agencies. Dr. Eliot, who as you well say, "is not an alarmist," put the situation accurately when he intimated that the present race will die out if the social evil is not removed. The one great problem before the men of this generation is, "What attitude are we to take toward the illegitimate exercise of our sexual passions?" There are many encouraging evidences that the great leaders are not willing to allow this subject to be supprest any longer. A few of these evidences are the teaching in medical schools that the health of men is better if they remain continent; the advocacy of the single standard of morality by such popular magazines as THE INDEPENDENT and by such molders of public opinion as Dr. Eliot; the popularizing of the eugenic ideal; the formation of the American Federation of Sex Hygiene; the publication of pamphlets written by recognized medical leaders under the auspices of such a reputable organization as the New York Sanitary and Moral Prophylaxis Society; the report submitted at the International Hygiene and Demography Congress in Washington last September on a graded course in sex instruction, and the work of the Bureau of Social Hygiene, with such men connected with it as Dr. Abraham Flexner and George J. Kneeland. The only solution of the social evil problem is thru the men who create it. A Single Moral-Standard League should be formed and men who have wives should join; then the men with sisters should join, and then those who have mothers.

Patriotism, chivalry, justice, morality, religious belief, be it Christian or Jewish, all these should be the animating causes behind a man in forcing him to join or in

giving him the privilege of joining such a league for the ultimate wiping out of this greatest source of misery, poverty and imbecility, which wrecks character, breaks homes, poisons the racial stock, and ultimately will destroy our civilization.

ROBBINS GILMAN.

JANUARY 23, 1913.

Dear Sir: It was coincident if not significant that your excellent editorial on "Is It Crime as Well as Sin?" came first to my eye as I opened the magazine this morning.

I am a senior nurse in a large hospital; have spent three years in a Western college and took this training to help make more complete my education and general knowledge.

What I have observed and know hundreds of other good nurses all over this country know—that not all crime is considered a sin; in fact, is excused to a large degree on the plea that "they have sown their wild oats"; and a double standard of morality for men and women.

Just ten feet from where I am writing lies a girl-wife of seventeen who three days ago submitted to an operation from which she will not recover.

A marriage of three months and this is the result—a virulent specific infection causing all tissues of the organs to slough away. She lies there clutching at my hands and crying out "My God! what pains." I can only relieve her for the time being and comfort her as well as I can, thanking God that at least there shall be no offspring here.

An innocent victim, a girl who has no doubt led a clean, pure life; devotedly attached to her young husband, never dreaming he is to blame for her condition. And this is only one of many.

I could write much more. Believe me, this question means much to me, dealing as I have to, with the innocent victims.

I am a devoted reader of THE INDEPENDENT, and allow me to say you can do no greater work than to urge and advocate purity and the stamping out of vice. Innocence is not a virtue and ignorance is not bliss. The public and coming generations should be enlightened.

I hope you will pardon my trespassing on your time, but I had to speak out!

The editorial referred to in the two last letters was publisht with some misgivings, because it is not a question that we would wish to discuss in a family magazine, and we feared that some of our readers would take offense at any reference to such a subject, however decorously treated. It was, therefore, especially gratifying to receive a number of letters like the above commending it, and none at all objecting to it. There is undeniably a disposition to treat this evil more frankly and publicly than ever before, and a greater determination to wipe it out.

PHOENIX, Ariz., January 17, 1913.

What made you do it? To my mind "Survey of the World" was by far the best part of your magazine. I am a busy man, but I like to keep informed of the general political news of the world. The Western papers contain but little news of the world in a broad way, and when they do the items are so lost among the records of petty crimes and department store advertisements that a man must have the tracking ability as well as the endurance of an Apache scout to find them. Besides, most of the newspapers give more attention to the sprained ankle of a princess than they do to the election of a parliament. The old INDEPENDENT used to give me just what I wanted. In a half hour I could get a good general idea of what of importance had transpired in the world during the week. I am much interested in the revolution in Mexico, and often I could get a better idea of what was really going on down there from THE INDEPENDENT'S weekly column than I could from seven days of newspaper wading.

Can't you give us back our old "Survey of the World"? There is a wilderness of magazines giving us different people's opinions upon what is going on in the world, I want some magazine to tell me what really is going on, and then form my own opinions.

In other respects I like the new INDEPENDENT very well, but I care more for the one sheep that is lost than for the ninety and nine which remain. W. H. ROBINSON.

We are naturally disappointed in receiving such letters as the above, for we expected that by enlarging the "Survey," illustrating it and including a greater variety of topics and more original matter to give increased satisfaction to all of our readers, sufficient to justify the additional expenditure of several thousand dollars a year required by the new form. We believe that those of our subscribers who were at first dis-

satisfied will find the change is not so great as it may appear at first. We do not propose to neglect either the revolution in Mexico or other events in foreign lands, but shall treat them topically rather than chronologically. If, however, there is a general demand for a week by week compendium of current events, it will be very easy to restore that feature whenever we enlarge the magazine, as we expect to do, as soon as the increase in the subscription list will permit of it.

ELMER, N. J., January 7, 1913.

THE INDEPENDENT, in new dress and style, reached me yesterday. I have been a continuous subscriber for about twenty years.

I can find fault, however, with the highly calendered paper on which it is printed. I attempted to read THE INDEPENDENT last night by gaslight, but had to discard it for other reading matter on account of the strain upon the eye. To my mind you have made a serious error in adopting this glazed paper. Of course, it will make pictures show up clearer, and purely from an ornamental and artistic standpoint it may be an improvement, but from the standpoint of the reader seeking information it is a serious mistake. It is far easier to read by artificial light your former smaller type on the paper you have been using than the larger type on the glossy finished paper you have adopted. I doubt not thousands of INDEPENDENT readers will rebel against this eye strainer, altho few may write you about it.

The paper is just the same as has been used for the last six or seven years.

OSCEOLA, Ind., January 25, 1913.

Know that I highly appreciate the new dress, the new arrangement, and the new ideas put into THE INDEPENDENT by the new management.

Your large type is most restful to the tired eyes in evening reading. Your leading thought-provoking article, and the clear, concise articles in general, appeal to the busy and thinking man. Your "Well Said" department is a little gold mine and your "Survey of the World" is an inspiration in its way, as helpful as it is unique. Your series of articles on "Advertising Affirmations" and on "Insurance" are the best I've ever seen.

Of the twenty daily, weekly, and monthly publications which I take, no one is looked forward to with greater pleasure in its coming than is THE INDEPENDENT.

H. A. MORAN.

STAMFORD, Conn., January 10, 1913.

Editor: I have read with interest and sympathy the article in this week's number by André Tridon; with interest because every man must be deeply concerned over the serious social conditions that confront us; with sympathy because no one can be unmoved by the spectacle of the thousands of underpaid and overworked laborers in our country.

But I wonder if Mr. Tridon and his companions in the I. W. W. have found "the way out." What assurance can he give us that such violent confiscation will secure the end he desires—the welfare of the workers (if we may for the moment limit our thought to them)? Can he assure us that soon after the workers get possession of the factories they will not develop friction, jealousies and animosities? Some of them will be stronger than others. Will these stronger not seek their own advantage at the expense of the weaker? It must be so, I am sure. No plan they may adopt will work itself. Still will the weaker suffer.

In fact, his article affords proof of the fallacy of his claim. Toward the conclusion he complains that certain unions have conducted strikes successfully without the sanction of the central body. This he declares is subversive of discipline and promotes weakness in the organization! If individuals are thus unruly now when they are supposed to be united against the common enemy, what will they not be and do when the enemy is vanquished?

H. E. BENTON.

MONROVIA, Cal., January 25, 1913.

About six weeks, ago my wife and I were obliged to leave our home at San Buenaventura, Chihuahua, Mexico, on account of the increasingly menacing conditions in our district. We have been for twenty-eight years missionaries among the Mexicans; for much of this time under the A. B. C. F. M. and still working in connection with its mission there, but now self-spporting.

For years we have been subscribers to THE INDEPENDENT. During the past two years we have had no federal mails in our region, but at irregular intervals mails would get thru to us by other conveyance. Sometimes three or four months would pass without our hearing from the world outside; then a large delivery of mail would arrive. One such arrival brought us nineteen num-

bers of THE INDEPENDENT, and even then some numbers were missing! Strange as it may seem, our most reliable information as to conditions in Mexico, and occurrences there, were received thru your magazine.

Much has appeared in our papers as to the influence of American money in the present armed uprising in Mexico. Many believe that private financial interests here are "behind the painted scenery of brigandage" in that unfortunate country.

I am not prepared to deny that influences foreign to Mexico may have aided in the insurrectionary movements there; but only concerning some internal causes of the disorder.

When Diaz was forced to resign, Madero, the most prominent of those urging reforms, was elected President. To the wonder of onlookers, before the newly chosen executive had taken his oath of office, the murmur of new revolt was heard. Why? For various reasons.

First, some of the independent leaders against Diaz—as Zapata—were little else than brigands, who, having had a taste of the freebooter's life under the guise of revolution, objected to any re-establishment of order.

Second, many of the military commanders who had supported Madero were disappointed that in the organization of his government they were not rewarded by remunerative civil appointments, for which they were not qualified.

Third, loud complaint was made that the new President had chosen as associates some experienced men who had served under Diaz, and again, that he gave prominent positions to his own relatives.

Fourth, the cry was soon raised that Madero was not fulfilling his pledges of reform. "He has climbed into the presidential chair," they said, "and now he is allowing things to go on in the same old way."

In my own section of Mexico nearly all the officers who had been with Madero joined later in the uprising against him. The leader of the new revolt in our own town was a former soldier of Madero, who, for his dangerous socialistic agitation among the troops, was locked up. Revenge was clearly in his fierce hostility to his former commander.

Another thing contributes very largely to the long continuance of disorder in Mexico, and, to my mind, makes the prospect for early peace discouraging. It is this: the rank and file of the insurgents are young men from the ranches, cowboys, and the work-avoiding element from the towns, who have no intelligent understanding of why they are in arms, but like the kind of life proposed to them by their officers—a good mount, two or three belts of cartridges, a rifle, a jolly crowd, exciting adventures, no work, plenty to eat, especially fresh beef, and always the prospect of new "finds"—wagons of provisions to capture, a ranch to plunder, a store to sack, a saloon to drain.

The insurrectionists for the past year have been employed in works of destruction and robbery rather than in fighting, which they avoid. The burning of railroad bridges, cars, and even whole trains, the capturing of engines and of trains, and letting them loose at full speed, to work death and ruin at some point down the track, the rounding up of immense herds of cattle and selling them to cattle buyers, the looting of mines, the kidnapping of prominent citizens and holding them for ransom, and the maltreating of women—all these experiences are counted among the attractions and rewards of the insurgent's life.

Peace, for them, would mean an end of these adventures and a return to work or to a continuance of bandit life as a profession.

After the little city where I lived had been taken by the anti-Madero revolters, in February last, forced loans were demanded of the principal citizens. Merchants were relieved of their goods. Hundreds of my Mexican neighbors suffered loss of horses, saddles and provender. Beef cattle were rounded up, killed and drest in the streets. Military order, or disorder, prevailed. The town was now in the hands of the rebels and now under the federals. Four times we experienced a local revolution, yet not a man was killed in these violent changes.

The alarms, the molestation of families, the wholesale robberies, the imprisonment of prominent men and demanding a round sum for their liberation, the paralyzation of business, the suspension of ordinary administration of law, the suspension of schools and church services, the stoppage of the mails for months at a time, the making of all travel and commerce exceedingly perilous—these are among the inconveniences of living in revolutionary Mexico.

Our "sister republic" is deserving of our sincere sympathy in this her time of sore trial. Because probably not one-fourth, perhaps not one-tenth, of the Mexican people are in sympathy with the present disorders. They are ashamed of them. They themselves are the sufferers, and are praying for peace and order again. ALDEN B. CASE.

THE NEW BOOKS

Napoleon the Man

By lifelong labor Dr. Rose has fairly won the position of the foremost authority on Napoleonic history in England. His personality is sympathetic; he lectures well; and his course in Boston last Spring drew a large and pleased audience. Yet it cannot be said that his treatment of that evergreen but overworked theme, the personality of Napoleon, adds anything to what we already knew.*

Dr. Rose's method is to select eight aspects of the great Corsican for topical treatment: the Man; the Jacobin; the Warrior; the Lawgiver; the Emperor; the Thinker; the World Ruler; the Exile. He excludes, therefore, the statesman and the man of letters. It is on these two neglected aspects and on Dr. Rose's least good lecture, the Warrior, that a few words will be written here.

Napoleon has focused so much attention individually that his background has been much neglected. It is only of late years that students of his epoch have slowly come to see that his policies have been interpreted too much in a personal sense, not enough in the sense of historical continuity. For Napoleon derived the elements of his administrative system from Louis XIV, his codification of French law from the jurists of the Convention, his scheme for the conquest of England from Choiseul, his Polish policy from a careful study of political intricacies stretching more than a century backward. His action as a statesman is largely personal, it is true, but it belongs to the whole movement of European politics and has been insufficiently considered from that point of view.

Again Dr. Rose passes over Napoleon in terms of literature. The place of his world drama, with its stupendous catastrophe, in the romantic movement, is a difficult theme, hitherto not attempted. The Emperor's literary studies, literary output and critical faculties, tho peculiar, are outstanding. Dr. Rose is incorrect in saying that he never wrote poetry; two lines remain, a strange product of boyhood, so misspelt and of such doubtful import that they can be quoted only in the original:

Du Dieu même du peau eussiez vous l'éloquence
Que son tous ces dons? Sans celui de l'avallance.

This certainly does not constitute a valid certificate for admission to Parnassus, but Napoleon's prose at its best, clear, trenchant, logical and occasionally tinged with the flame of passion, deserves more consideration for its author as a mere writer of words than it has generally obtained.

Napoleon the soldier, we think, Dr. Rose misses; perhaps because his analysis is too detached and not sufficiently comparative. The wide combination of qualities that makes the great general is a very subtle thing to determine, and one of the most effective ways of seizing its aspects is by comparison. By placing Frederick and Lee side by side with Napoleon we obtain the means of getting at the peculiarity of the latter's mental working, and we should say without hesitation that that peculiarity is mathematical. Frederick is always the drill master and tactician, annihilating his enemy by an unforeseen *right wheel.* Lee is always the psychologist, playing on an adver-

**The Personality of Napoleon.* Lowell Lectures for 1912. By J. Holland Rose. New York: G. P. Putnam's Sons. $2.50.

sary's little foibles discovered in old West Point days. Napoleon is on occasion a poor tactician, and generally a bad psychologist, but he is always a past master of geometry.

To him Germany and Italy, the plain of Castiglione and the hills of Bautzen, always appeared inscribed with squares and T's and various angles, figuring the march of triumphant armies. He habitually minimized the importance of the man who might draw the counterfigure; he sometimes left the enemy's army almost out of the account, as when he traced the progression of his famous square from Bavaria thru Saxony toward Berlin in 1806. That square, maneuvering on Lannes' fixed point, became a line, then an arc, and swept to destruction the Prussian army at Auerstadt and Jena.

His first and his last campaigns were planned on the conception of breaking down the apex of a V; in the first his opponents did not understand, and so were destroyed; in the last they had gained their competence at his school, which he failed to reckon with, and he was destroyed. Geometry alone was proved to be an insufficient solvent of battles. The theme is a long one, fascinating in its details, and one may justly regret that Dr. Rose did not attempt it. Napoleon said at St. Helena: "The great art in battle is to change the line of operations during the course of the engagement; that is an idea of my own and quite new." It is at least curious that no historian and no military theorist has ever attempted an explanation of this dictum. The solution may be found from the angle of Napoleon's own mentality, that of the geometrician.

Jean Christophe, Idealist

Both in scope and at least in partial achievement, M. Romain Rolland's *Jean Christophe,* now definitely complete in the appearance of its tenth and last volume, must rank as one of the very few important works of fiction of the last decade.* In a recent review in the London *Times* a writer found in M. Rolland kinship to both Tolstoy and Rousseau; to those who know M. Rolland a rather unusual conclusion, at least in the case of the latter. Yet the writer's intention was evident. *Jean Christophe* is scarcely a novel in the popular sense, but rather the epical apotheosis of an era, an apotheosis that is none the less the statement of a personal gospel. In its colossal size, in its apparent incoherence of method, in its lack of any definite plot, in its broken and at times even tumultuous style, the novel is far removed from the cameo cuttings of the modern French school, and, indeed violates practically every canon of Gallic taste. There is something positively Teutonic in M. Rolland's style and standpoint beyond the mere fact that his chief protagonist is a German.

The first section of the novel, *L'Aube,* appeared in 1904; the last, *La Nouvelle Journée,* last November; so that M. Rolland has been at work continuously for nine years, a work into which he has thrown himself with an entirety and a seriousness of purpose little less than heroic. Tho the work has sometimes been described as a "musical novel," this limitation seems hardly fair. The book is rather a prose epic in the form of fiction in which music becomes the symbol by which the author is enabled to set forth his thoughts. In the introduction to the last volume are the words that perhaps best sum up M. Rolland's intention:

> Life is a series of deaths and of resurrections. Let us die to be reborn.

It is this tonic note of optimism, an optimism far different from that of Meredith, in that it is an optimism of the intellect rather than the blood, that perhaps the greatest value of the work lies to us of the present generation. It is to the young men of the world that M. Rolland dedicates his

**Jean Christophe.* 10 volumes. Paris: Ollendorff. The English translation (Henry Holt & Co.) will be complete in 3 volumes, of which two have been issued.

book, to the young men reborn from the enervating sensualism and the intellectual vagabondage so beautifully and destructively expresst by Anatole France and Maurice Barrès. It is written in the full knowledge that life is hard and bitter and cruel, yet ever with the faith that to the sufferer who does not yield that life becomes thru his informing spirit radiantly beautiful. It is this spiritual quality, this ever present consciousness of the infinite, that gives the work a unique place among its contemporaries. It is as if written by a Tolstoy freed of fanaticism and endowed with Gallic light. He sings, for he does sing in many exquisite passages of exalted lyricism, of France reborn, and not only France, but Europe; reborn out of the ashes of materialism into a spiritual faith.

There are many passages illustrative of this that might be cited, but perhaps supreme of all is the story of Christophe's guilty passion for Anna, the Swiss Calvinist. It is a story that in its depiction of the pangs of conscience and in Christophe's need for a spiritual expiation appears unique in these days of socialistic dialectic, and bears not a little resemblance to our own Hawthorne's *Scarlet Letter.* Anna herself is a figure that for somber power is worthy of a place high in the gallery of heroines of fiction. There are other figures too: Schultz, and Christophe's uncle, and Sabine, and Olivier, and Antoinette, that pay abundant tribute to M. Rolland's understanding of the human heart. Much deep and penetrating criticism, too, the work possesses, which brings into remembrance that other prose epic, Goethe's *Wilhelm Meister;* only M. Rolland is never the Olympian Jove, but a father who feels and lives and loves his children. Christophe himself only half lives, but Christophe is not a man but the expression of an epoch.

Will *Jean Christophe* take its place among the great masterpieces of fiction? Is M. Rolland of the immortal company of Cervantes and Fielding and Thackeray and Balzac —or will he pass and be remembered as a figure who was a power and is no more? Time only can decide, and epics have never been popular in modern life. To us of today *Jean Christophe* is a vital, compelling work, a work forged in the fire of a terrible sincerity. We who love it feel that it will live. As for Mr. Rolland, let him speak for himself:

> Pleurer sur les ruines de l'art? Elles n'en valent pas le peine. L'art est l'ombre de l'homme, jetée sur la nature. Qu'ils disparaissent ensemble, bus par le soleil!

The False and the Real Japan

Imagine the impression that would be conveyed if someone pasted on the wall a gaudy chromo gained with a pound of tea and pretended it represented the delicate work of some great Japanese artist. A reading of *The Honorable Miss Moonlight,* by Onoto Watanna (Mrs. Bertrand Babcock), leaves one with the same feeling of amused disgust.[1]

Melodramatic thruout, this story is based on the impossible situation of a marriage between the heir of a proud Japanese nobleman and a geisha, who sings and dances for hire. Since no member of the Japanese nobility can marry without the consent of the Imperial Household Department, which never would give its consent to such a *mésalliance,* is it not evident that the main theme, its absurd incidents and stagey characters, are simply emanations from the fervid imagination of a woman who seems not to know the real Japan.

To mention one of the grossest banalities: Gonji, the hero, after divorcing his geisha wife, leaves the nobly born Ohano, his new wife, to go to the war. Because Ohano has borne no children and the geisha has given birth to a boy, the tyrannical stepmother instigates the fat and self-satisfied Ohano to commit suicide, so that Gonji, well rid of her,

[1] *The Honorable Miss Moonlight.* By Onoto Watanna. New York: Harper & Bros. $1.

may take back his geisha. The whole situation is ridiculous. Consider the way in which this high born Japanese maiden is made to kill herself. Instead of opening the artery in her throat with the short dagger every daughter of a samurai was trained to use, she is made to fall upon the long sword of her father.

A very different picture is presented in *Just Before the Dawn,* by R. C. Armstrong.[2] Written by a foreign resident of Japan, who, if not himself a profound Oriental scholar, has the benefit of excellent native helpers, this book is taken directly from Japanese sources. It is more than the life and philosophy of Ninomiya Sontoku, the sage and economic reformer. By reading the story of this extraordinary benefactor of the Japanese peasants we see very clearly the actual, internal condition of Japan when Commodore Perry came with his "fire-ships" to open its doors to the commerce of the world. Born in 1787 and dying in 1856, just after the successful termination of Perry's mission, this Ninomiya Sontoku lived thru the period of internal storm and stress that prepared Japan for the great change in her policy that the visits of Perry precipitated. It is a great mistake to think that Japan, after a seclusion of two hundred and fifty years, jumped full grown into western civilization when Perry cried "Open Sesame" at her gates. For years in the religious, the intellectual, the medical circles, there had been a seething and an unrest that was ready to burst forth at the first opportunity.

Books like *Just Before the Dawn* are always welcome. They help us to understand the real character of our brilliant neighbors across the Pacific. They are authentic. Written by those who know the land and the people by long residence and careful study, based on native works, and prepared in connection with native scholars, they give us a real and not an utterly imaginary and often erroneous impression of a people of whom it behooves us to know more and more.

[2] *Just Before the Dawn.* By R. C. Armstrong. New York: The Macmillan Co. $1.50.

Wise and Unwise Explorers

Two new books of travel and exploration illustrate two methods of approaching the same object, for both describe attempts to study the ethnology of savages of the most primitive sort in their native homes and pristine condition—the Papuans of southwestern (Dutch) New Guinea and the negroes south of the middle course of the Congo.* To the first went a band of Englishmen, accompanied by a great retinue of East Indian natives, for which provisions had to be provided by the ton, and so many carriers that they ate the stuff nearly as fast as it could be obtained; and the leaders partly blundered and partly were unfortunate to such an extent that they never got out of the single poor river valley where they began, and entirely failed in the first purpose of the costly expedition, which was to climb the unexplored Snow Mountains. They became somewhat acquainted with a single small community of Papuans, and saw a few Negrito dwarfs, none of whose words or customs were learned. The enterprise fell by its own weight, and a book a quarter the size and cost would have amply sufficed to tell the uneventful story.

On the other hand, two men, accompanied by less than a score of followers, unarmed, except with sporting guns, living mainly off the country, tramped and boated hundreds of miles thru equatorial Africa, gathered great stores of information and specimens of native art and handicraft, visited remote, unknown and utterly savage peoples, and left behind them an impression and reputation which will make it easier for

* *Pygmies and Papuans.* The Stone Age Today in New Guinea. By A. F. R. Wollaston. 8vo, illustrated, 352 pages. New York: Sturgis & Walton Co.

Land and Peoples of the Kasai. Being a Narrative of a Two Years' Journey among the Cannibals of the Equatorial Forest and Other Savage Tribes of the Southwestern Congo. By M. W. Hilton-Simpson. Decorated. 8vo, 356 pages. Illustrated. Chicago: A. C. McClurg & Co.

every white man who ventures on their path. Such men do not have thrilling adventures—their very success depends upon their doing their best to avoid them; but they found interest in every step of their intrepid way. Their book, as quiet as themselves, is excellent reading and indispensable to the man who has thoughts of going into western-central Africa. A large part of their travels was thru country inhabited by cannibals; and it is startling to learn of such men and practices as exist right now in a region whose borders may be reached by railroads and steamboats. One tribe, at least, of these cannibals are not simply men who eat an enemy, or perhaps only his heart, after a battle, in a ceremonial sort of way, but men and women who hunt other men and women to slay them for the sake of feeding upon them exactly as so much game; and who, when strangers come to the village whom they wish to entertain, will slaughter a slave for the feast as we would kill a chicken. Cool scientific work, all alone among these and other equally untamed but far superior people, by men of trained intelligence, is sure to produce not only valuable, but very interesting results.

Both books are profusely illustrated by photographs, and are furnished with maps and indexes.

Literary Notes

Dr. Hillis has publisht another of his inspirational books, containing a dozen addresses delivered on anniversaries *All the Year Round* (Revell, $1.20), celebrating great men and events of the republic.

Dr. Lawrence Marcellus Larson's *Canute the Great* is also an account of the rise of Danish imperialism during the Viking age (Putnam). The Illinois professor's style is clear cut and straightforward and his book is well illustrated.

A new edition of *Milk and Its Products*, by Prof. Henry H. Wing (Macmillan, $1.50) brings the mass of valuable information about that staple food up to date. There are four new chapters, and some directions for scientific tests.

Houghton Mifflin Co. plan to publish at the time of Woodrow Wilson's inauguration a limited Riverside Press edition in one volume of three of his essays: "Mere Literature," "The Author Himself," and "On an Author's Choice of Company."

Bishop Walpole, of Edinburgh, has put into a volume entitled *Life's Chance* (Dutton, $1.50), a number of sermons, the fruit of his thought and meditation on the opportunity life affords of choosing and working out worthily one's ideal.

The unexpected guest ought to bless the author of *The Chafing Dish and Sandwiches*, by Alice L. James (Putnam's, $1.25), for in its pages his impromptu meal is provided for speedily and without anxiety on the part of his hostess.

Margaret Sangster has endeared herself to thousands of American mothers who will welcome her new volume, *The Mother Book* (McClurg, $2) made up of prose and verse characteristically gentle and serious. Many years have brought a wisdom in dealing with everyday experiences that will be helpful to young mothers.

Rev. Charles Stelzle has had ample opportunity to study at close range the *American Social and Religious Conditions* (Revell, $1), of which he writes with such vigor and conviction. His statistics, often presented by charts, are not mere meaningless collections, but are carefully used in connection with observed facts and tendencies to make clear social and religious problems and solutions.

The publications of the Cambridge University Press have been taken over by the University of Chicago as American representatives and this arrangement includes the following publications, which will in the future be issued in America under joint imprint: *Biometrika; Parasitology; Journal of Genetics; The Journal of Hygiene; The Modern Language Review; The British Journal of Psychology; The Journal of Agricultural Science.*

The first to get out a book on *The Balkan War* are two English photographers, Philip Gibbs and Bernard Grant. The former went with the Bulgarian and the latter with the Turkish army, tho, as a matter of fact, neither of them saw much of the fighting. But their experiences and observations are worth reading and their photographs, some of which have been publisht in THE INDEPENDENT, are of interest. (Small, Maynard, $1.20.)

Drawn by C. R. Weed.

Jimmie, the Future Boss:—"Someone's got to be Governor or we can't play the game."
The Gang (in chorus):—"But I want to be the man that runs the Governor.

SURVEY of the WORLD

The Laws of the Air

The amazing development of aircraft during the last five years makes the law of the air a subject for both national and international concern which is attracting many writers and some legislatures. It is of particular interest to students of military law, who are considering how far it will be made legitimate to use aeroplanes for scouting or for dropping explosives from the sky on armies, forts, ships or cities. Doubtless the next Hague Conference will give much attention to formulating laws of the air.

The subject has not been entirely overlooked. It has been a generally accepted principle in national or state legislation that the man who owns land owns the air above as well as the earth beneath as far as he cares to exercise his rights. A building in New York rises over seven hundred feet, and might have gone seven thousand had the owner chosen. A man standing in his own field can be forbidden to shoot birds flying over a neighbor's field. A volume on *International Law Situations*, recently issued by the Naval War College, reminds us that a balloon was used for observation at the battle of Fleurus in 1794; and in the Franco-Prussian war balloons were used to a considerable extent; but the captive balloon raises few questions of military law. That war settled that any balloonists captured may be made prisoners of war, but cannot be hanged as spies as they are not in disguise. The Hague Conferences of 1899 and 1907 took this position.

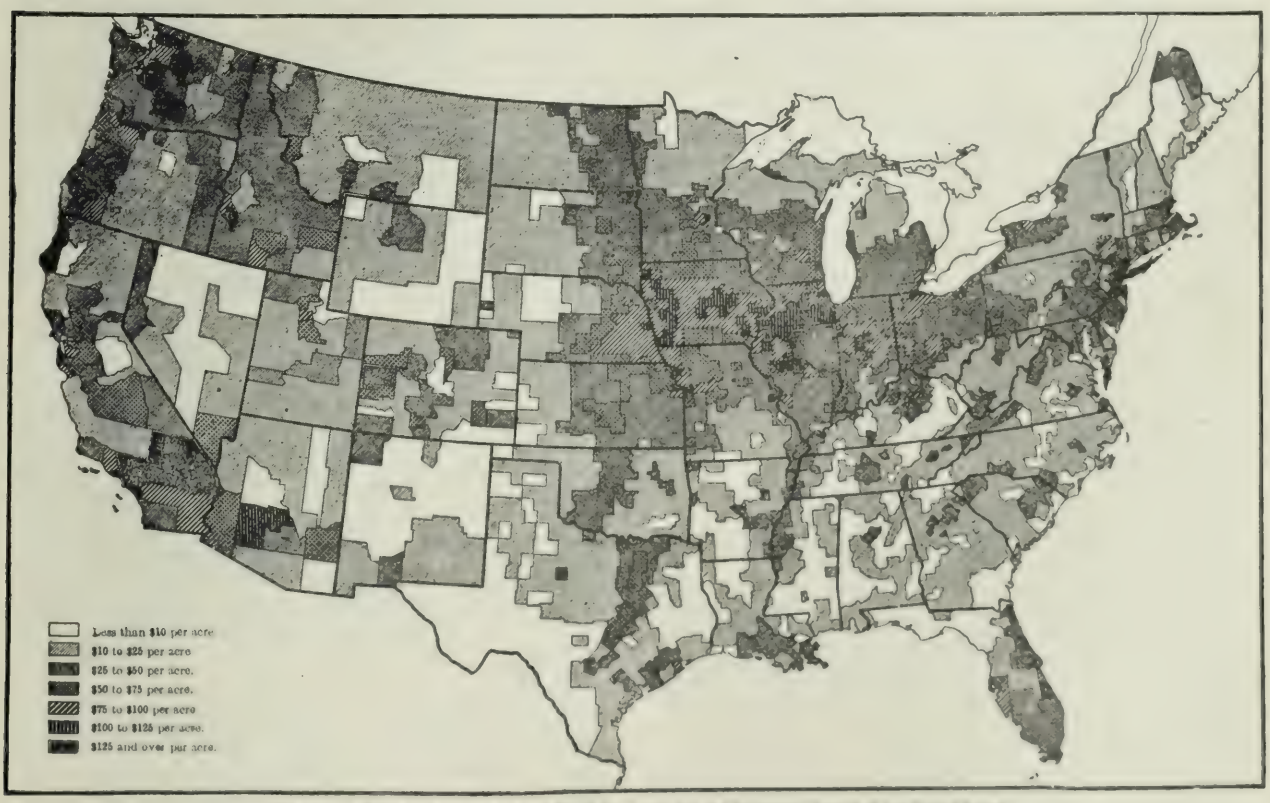
The Hague Conference of 1899 forbade the discharge of projectiles from balloons for five years; but when this prohibition came up for renewal in 1907, only about half of the States were prepared to renew it. It was, however, agreed that projectiles must not be dropt on undefended buildings or towns, but there is no prohibition against using them for observation, scouting, or for bombardment of defended positions.

Since 1907 the balloon has given place to the airship which can go anywhere and at any hight, so that conditions are utterly changed. The customs service is affected. France has laws requiring that a foreign aircraft on landing be detained by the nearest competent official till released on the payment of duties. In the late war between Italy and Turkey the Italian army used aeroplanes freely in discharging projectiles. There is little difference in the actual effect of a projectile whether it is fired from a gun several miles distant or whether it is cast from an aircraft a thousand feet up in the air.

A special question will arise in case of war as to the right to invade the airspace above neutral territory. It would doubtless be agreed that belligerent operations must not be allowed in the air above a neutral state; but probably a rule will be adopted forbidding entirely all passage over neutral territory, just as belligerents must not cross neutral territory with troops.

This rule is based on the principle as to the right of rule by a state of the aerial space above it laid down by the International Juridical Committee on Aviation in 1910, which declared that aerial circulation should be free anywhere, but subject to the power of a state to lay down rules for the protection of safety and of private rights. On this principle in 1909 Denmark declared that Germany had no right to establish a station in its territory from which to fly to the Pole, and could forbid any flight over its territory if prejudicial to national interests.

While intricate questions may arise in case of war, as to blockades, the rights of neutrals, and the rights of belligerents to seek harbor in neutral territory, this much seems settled, that projectiles may be fired from aircraft at defended, and not at undefended, towns or buildings, and that belligerent aircraft have no right to fly over neutral states. But the rule is likely to be very liberal in time of peace.



Average Value of Land in Farms

The census is an extremely useful and an extremely arid institution. When you, dear reader, look at the legend at the bottom of the map, the impression then given plus the impression already probably received because of the forbidding appearance of the

map itself is likely to result in the hasty turning over of a leaf, to pages more promising of entertainment. And yet, when you are next displaying your knowledge, or your lack of it, in some discussion relative to agriculture, or land values, or taxation, such facts as are crystallized in the map may be very useful to you in the desirable process of overwhelming your polemical adversary by the weight of the facts with which you support your contentions. Mr. Gradgrind may have been too intense in his devotion to facts, but he got along better than Mr. Skimpole, who ignored them completely. To help you comprehend the significance of the map, it is noteworthy that average land in farms, wherever situated, showed increases over values reported in the census of 1900. For the whole country the comparative figures are $32.40 per acre in 1910, comparable with $15.17 in 1900 (108.1 per cent increase). Geographical subdivisions show percentages varying from 24.5 for the Middle Atlantic Division (New York, New Jersey, Pennsylvania), to 222.4 for the Mountain Division (from Montana and Idaho to New Mexico and Arizona). The smallest absolute increase is that shown by New England ($5.49), with a relative increase of 40.5 per cent. The largest absolute increase is found in the East North Central Division, commonly termed the Middle West ($27.17), with a relative increase of 79.6 per cent. The shadings given on the map are really based on the average value of land in farms, altho in some parts of the country as little as one-fifth of the total area of a county is in farms. It is also disclosed by the census calculations that the principal factor in the increase of value of farm property as a whole (which term includes land, buildings, machinery, and live stock), has been the increase in the value of land per acre.

Some Smoke Suggestions

The average locomotive in Chicago at the present time is making smoke, the density of which is 14.92 per cent. This shows, according to the *Railway Age Gazette*, a decided improvement over the conditions recorded by the city smoke commission three years ago, when the average density was reported as 23.3 per cent. The percentage gives the ratio of actual performance to worst possible performance; 100 per cent. If it gave out no smoke at all the percentage would be zero. The figures give the results of innumerable observations covering the entire city, designated as zone A, and also a zone beyond the city limits, designated as zone B.

The original of this map appears on page 375 of the Abstract of the Thirteenth Census of the United States

AVERAGE VALUE OF LAND IN FARMS PER ACRE, BY COUNTIES

The averages (taken in 1910) are based only on land in farms, each county as a whole being shaded according to the average value of such land per acre, even tho the proportion of the county devoted to agriculture is very small. The average value for the United States is $32.40.

This fact shows that smoke abatement is feasible, a fact which is becoming more generally recognized. In a recent address on "Coal Smoke and its Practical Abatement" J. M. Searle, chief of the division of smoke inspection in Pittsburgh, brought out the following points, each one of which is most significant and suggestive:

1. That a smokeless stack does not always denote high furnace efficiency, but when it does not, the fault always lies with the management.
2. That the making of smoke means direct waste of money to the manufacturer.
3. That public health and convenience both are martyrs to the smoke evil in our cities.
4. That there are far too many unavoidable losses in the process of combustion without submitting to an easily avoidable loss.
5. That the steam jet in any form, as a smoke abater, should not be used.
6. That you should commence at your boilers, and not at your engines, to improve your plant.
7. That the locomotive underfeed stoker, the gas producer power plant, also powdered coal, are growing factors as smoke abaters.
8. That engineers should not permit the construction of any more smoky metallurgical furnaces.
9. That hand firing is extravagant and necessarily smoky, and should not be considered.
10. That sufficient area and proper arrangement of combustion chamber are among the prime factors in smoke abatement.
11. That the soot which colors the products of our furnaces can be, and is burned; therefore, the phrase "smoke consumer" is not a misnomer.
12. That smoke makers, for their own protection, should be compelled to arrange their plants as to render their stacks practically smokeless.
13. That much smoke does not indicate much prosperity for our cities.

These conclusions are entitled to great weight, not only because of Mr. Searle's own position as an expert, but because Pittsburgh has been one of the greatest producers of smoke and is now giving more detailed attention to the subject than is any other community.

By a few simple changes in the construction of its furnaces and by educating its firemen to be more careful, the Atlanta Gas Light Company has cut down its smoke 50 per cent., saved 4½ tons of fuel per twenty-four hours, and at the same time increased its evaporation 20 per cent., according to Paul McMichael, the smoke inspector of that city.

"That," says he, "is an example of what plants can do if they will cooperate with the city in eliminating the smoke nuisance. They only put some more bricks in their combustion chamber, in order to increase the combustion surface, and already they are saving nearly $15 per day in fuel, besides cutting down their smoke and increasing their evaporation as I have said. They are going to make more improvements which will benefit them still further and cut down their smoke still more." He goes to their plants and gives them the benefit of everything he knows on the subject. So much of the work of reconstruction has been done in the last two weeks that the inspector has had to make but very few observations of stacks to ascertin if they are coming within the law.

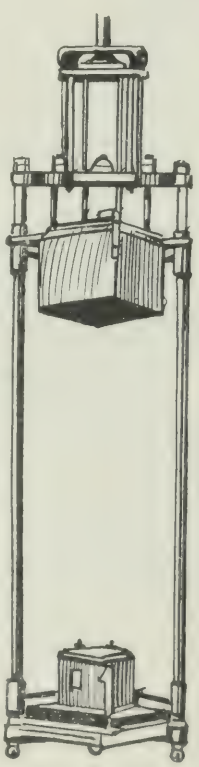
The example of Chicago, Pittsburgh and Atlanta points the way. It will be interesting to observe if other cities will follow and show they appreciate the gain in efficiency which real smoke abatement involves.

A Free Library for Travelers

The extreme of library enthusiasm is represented in England by a proposal to establish small libraries in tram cars. It may be possible in that supposedly placid isle, tho one can hardly fancy anything as thick as a book finding room for itself in any of the means for transportation provided in the city of New York. One English gentleman, however, has quietly put in motion a benevolent little library scheme of his own that is distinctly not a subject for satire.

The Vicar of Midhurst, the Rev. Frank Tatchele, M. A., has had placed in the two railway stations of that town small bookcases each containing about a dozen books. Above each case he has placed this notice:

"These books belong to the Vicar of Midhurst and are entrusted to the care of those who use them. Travelers are welcome to take a book with them on their journey if they will kindly replace it on return, or send it by post to the station master."



Here is a perfectly simple scheme. The borrowers are not even asked to leave their names and addresses, and there is no rule as to the length of time allowed for reading. The public so far has been nothing but appreciative of the vicar's confidence, and the books have had plenty of use.

Many letters have come to him with personal thanks and so far only one or two books have been missed; and they, of course, may be in the hands of unusually thoro and diligent students. The books are changed every three weeks, giving a sufficient stream of fresh literature to frequent travelers.

Quite as novel as the railway station-library plan is one other practice of this progressive clergyman. He has a similar little book rack in his church, and the same wide use has been made of his literature there.

Light Under the Sea

The question of the depth to which sunlight may penetrate the water of the ocean may seem to most of us only a matter of a moment's curious interest, but it has much scientific significance, because upon the influence of light in the water depends in a large degree its life —all the life that is useful to us, as, for instance, the fisheries. It is only since photography came into being that we have had any means of learning as to light in the water farther than a water-glass or a diver could see. Divers have rescended 200 feet, but must carrrry electric lamps in order to work below 10 or 15 fathoms. The chemical effect of sunlight, however, penetrates much farther than its visible rays. When the early investigators lowered photographic plates on sounding-lines, htey were not surprised to find them affected at much greater depth than any diver's eyes had looked, until at last traces of light were recorded at about 300 fathoms. Lately, however, improved apparatus, invented by the Norwegian hydrographer, Dr. B. Helland-Hansen, has been used by him with remarkable results. This was so constructed that by triggers moved by a weight which slid down the line a plate could be exposed as long as wanted, at any desired depth, then covered, and so brought up without any interfering influences. It would show the intensity of light from above as compared with that received from the side; and the plates used were panchromatic and provided with color-filters, so that the prismatic elements in any light present at different depths would be recorded. This apparatus was let down repeatedly in the middle of the North Atlantic in 1910. As far down as 3000 feet and more it found light in considerable quantities, but at 5000 feet the plates were unaffected even after a long exposure. Below 700 or 800 fathoms, then, absolute darkness reigns—a fact which has some interesting biological relations.

The Helland-Hansen Photometer, open for exposure.

As a result of these investigations it has been determined that the ultra-violet and blue rays penetrate most deeply. "There were plenty of these rays," says the report, "at 500 meters, whereas the effect of the red and green rays was imperceptible there after an exposure of forty minutes: At 100 meters the rays were of every color, . . . but even at this depth blue and ultra-violet rays predominated." Such facts are of great assistance in dealing with such problems as the growth of marine plants, the colors of animals at different depths, and the modifications of eyes, service of phosphorescent organs, etc., in pelagic creatures.

The exposures were made at noon of bright davs, since only the vertical midday rays penetrate very deeply. Even at 10 or 15 fathoms, divers say, daylight disappears long before sunset, and except at high noon dark red objects look black and green weeds take a lighter tone, showing that the red rays disappear before the blue ones. A colored object will always look black when untouched by rays of its own color. At best the submarine light—that is, the transparency of the water—varies a good deal, even in the same locality. Now most of the minute organisms in the sea are dependent on light for existence, more, in many cases than upon temperature; and these are at the base of the food supply of the higher creatures. Plants there, as elsewhere, can live and grow only by the dissolution of carbon dioxide—a process which requires the aid of solar light. This explains why all the oceanic plants occur near the surface— a circumstance naturally followed by the fact that appears probable, however, that certain forms exist only at certain depths, so that the flora is in layers, as it were, and this seems coincident with the varying penetration of the different light rays. All sorts are much more abundant in summer than during the darker season.

A more striking feature of this matter is its bearing on the coloring of certain animals, which has been explained by most zoologists by the theory of protective coloration. The naturalists on the "Michael Sars" observed that the different water-layers were characterized by animals of special

colors. Speaking of the Sargasso Sea they report: "In the hauls from 500 to 750 meters and deeper we found only black fishes and red crustaceans (prawns). At 300 meters we found (fishes) with silvery sides and brownish backs. In the upper layers we met with transparent young fish. . . It is very interesting to note that the upper limit to the occurence of these black and red deep-water animals . . . is also the limit within which most of the sun's rays are absorbed, and it is important to note that the red rays belong to that part of the spectrum which is most rapidly absorbed by the water." Fishes taken in the daytime below this layer are uniformly blackish; but such are sometimes taken much nearer the surface at night, showing that only when it is dark are they moved to rise out of the gloom of the depths.

Thus the red and black colors of a large number of both animals and plants in the sea apparently depend upon the kind of light they get rather than upon anything else.

Elk Preservation

It is estimated that there are not now more than 70,000 elk in the United States. Most are to be found in the Yellowstone National Park and the Jackson's Hole region of Wyoming. The Government, however, has at last realized the necessity of prompt action if these splendid animals are not to suffer the same fate as the buffalo. Congress has already appropriated $20,000 for their feeding this winter, while last year over 700 tons of hay was provided for them at Jackson's Hole alone.

The Government is now ready to ship herds of about twenty to desirable forest reserves. Last summer herds were sent to Washington, Utah, Colorado, and Montana. Other States are to be supplied as fast as possible. The Government itself has about 165 national forests containing some 195,000,000 acres—all patrolled by an army of game wardens and forest rangers, and most of these will eventually be supplied with elk. It is a delicate undertaking, however, to corral and box them for shipment without injury, as they are anything but quiet when approached by men.

Last, but not least, the preservation of elk is being aided by the Order of Elks. For three years now the Elks have stopped using elk teeth as an emblem. There is every reason, therefore, why the useful and noble elk should thrive and multiply until they are to be found in every favorable forest in the land.

Charles B. Alexander

The New York Legislature elected last week Charles Beatty Alexander, the distinguished New York lawyer, to succeed the late Whitelaw Reid as regent of the University of the State of New York. Mr. Alexander was born in 1849, and graduated at Princeton University in 1870. He was admitted to the bar in 1872 and has continuously practiced law since that time. He is eminent in his profession, having been connected with some of the largest litigations. He has long been one of the legal advisers of the Equitable Life Assurance Society of the United States and is now one of the directors.

Mr. Alexander has always given much attention to the subject of education. For years he was a trustee of Princeton University and has made numerous addresses before educational and learned bodies. He belongs to a family that has been devoted to the cause of education for a century. In 1812 his grandfather, Archibald Alexander, founded Princeton Theological Seminary. His maternal grandfather, Matthew Brown, was president for many years of Jefferson College. His maternal uncle, Rev. Charles Beatty, worked with untiring zeal thruout his long life in Pennsylvania and Ohio, giving away a fortune in his lifetime and leaving the remainder of his money for education at his death. His father, the late Henry M. Alexander, served as trustee of Princeton University for some forty years until his death, and it was said that he never missed a meeting of the board during that period. His wife, who is a daughter of Charles Crocker, of California, erected at her own expense the commencement hall at Princeton University and has been very liberal in her educational benefactions.

Tho Mr. Alexander has been a consistent Democrat and is active in affairs of the party, he is entirely independent in politics. He was a delegate to the recent National Democratic Convention in Baltimore, and was one of the junior counsel for Samuel J. Tilden before the Electoral Commission at the time it was claimed that Mr. Tilden had been elected President. Mr. Alexander is a member of the Society of the Cincinnati and many other organizations and clubs and is the author of *The Life of Major Ferguson.*

Tho this is the first public office that Mr. Alexander has ever held, it is certain that he will be a worthy successor to the late Whitelaw Reid and it speaks well for Governor Sulzer that he has selected a man of his type to fill such an important position.

The Fighting in Mexico

After one day's respite, the fighting at Mexico's capital was resumed on the 11th, when the Federal forces made four unsuccessful assaults upon the arsenal, where Diaz held an apparently impregnable position. In one of these assaults 70 Maderists were mowed down by the rebels' machine guns. During the following days, until the morning of the 16th, the artillery duel continued. Many buildings in the finest part of the city were wrecked. The new National Theater did not escape, and the walls of the National Palace were deeply scarred. Hotels, the American Club's house, and the Mutual Life building suffered. A corner of the American consulate was torn away. Many non-combatants lost their lives, among them two American women while preparing luncheon in their home. Diaz used the Y. M. C. A. building as a base for his machine guns.

Foreign ambassadors protested against such barbarous warfare in the heart of the city, but without success. Early in the week Senor De la Barra offered his services as mediator, but they were rejected by both Diaz and Madero. Many foreigners sought refuge at the embassies. Against the protest of Ambassador Wilson, Madero placed guns where returning fire from Diaz would endanger the American Embassy, crowded with refugees, but Diaz, fearing intervention, declined to respond with his cannon. More than 3000 convicts were released from prison. They preyed upon the unfortunate people of the city. Both factions fired upon ambulances bearing white flags. Diaz's artillery work was notably accurate, and his losses were small in comparison with Madero's.

CATHEDRAL AND TRAMWAY STATION

In these towers, at the beginning of the fight, Madero placed machine guns, which killed many soldiers and civilians in the streets.

It was reported on the 14th that Madero had resigned, but the report was not true. He would die first, he said. A minority of the Senate, in special session, asked him to resign. He would not listen. To Mr. Taft he sent a message urging him not to intervene and saying that "terrible consequences" would follow if troops should be landed from American warships. Mr. Taft replied that intervention was not intended. Madero asserted that foreign residents would be safe if they should retire from the battle

MEXICO CITY FROM THE CATHEDRAL

The National Palace is near at hand but is not shown in this view, which includes part of the tract swept by the artillery of the two armies.

zone. Owing to the protests of the ambassadors it was agreed that there should be a truce of twenty-four hours, beginning at 2 a. m. on the 16th, in order that foreigners might reach places of safety. After only nine hours, however, the truce was broken.

In the north, Nuevo Laredo was taken by Orozco's rebels, and Emilio Gomez proclaimed himself President. Near the capital, Zapado's bandit army was inactive. A few of his men entered the city and robbed the people. Our Government sent six warships to the Mexican coast. Leaders of both parties in Congress opposed intervention. Director Barrett, of the Pan-American Union, proposed that there should be a commission of mediation. This was sharply resented by the American colony in the Mexican capital.

THE NATIONAL PALACE

The walls and doors of this historic structure, in which Madero defended himself, have been scarred by Diaz's shells.

The Japanese Riots

During the week Japan has seen such riots in her capital and elsewhere as characterized the news of the Treaty of Portsmouth. The opposition not of the Diet only, but of the whole country, forced the resignation of Prince Katsura as Premier, with his Cabinet. He had persuaded the Emperor to request the Diet to rescind its vote of want of confidence, but this they refused to do. This refusal was, for Japan, a very extraordinary and almost revolutionary act. It indicated that the will of the Cabinet, even supported by the reverence paid to the Emperor, could not be allowed to overthrow the will of the people; that it is the people that rule thru their Diet, and not the Emperor nor the oligarchy of Elder Statesmen.

When Prince Katsura and his Cabinet had presented their resignation they were actually stoned by a mob in the streets, and the unruly crowd attacked the offices of newspapers which had supported the ministry and attempted to set them on fire. The police and gendarmes drew their swords and many were wounded and six were killed, and the military was called out to protect the residences of Prince Katsura and his Cabinet. The Diet was adjourned for three days, but was not dissolved, as Katsura had desired. Peace has been re establisht by the appointment as Premier of Count Yamamoto, who represents the

Constitutionalists. He has many friends in this country, for he graduated in our Naval Academy in 1877, and has made five visits to the United States. He has been Minister of the Navy, has reached the rank of Admiral, and during the Russian war, while Admiral Togo commanded the fleet, he was, as Minister of the Navy, directing operations and was called "the brains of the navy."

It may be well to consider the growth of constitutionalism. When the Constitution was framed it was the idea of Prince Ito and the other framers to follow the German system and have the Cabinet responsible to the Emperor alone, and not to the Diet. It was to be superior to politics. It was immaterial whether it had the support of the representatives of the people or not. Naturally conflict immediately arose, and dissolution followed dissolution until the breaking out of the war with China in 1894, when opposition was suspended for a year. Again there was conflict until Prince Ito, always the most enlightened of the leaders, entered into an understanding as Premier with Count Itagaki, leader of the Liberal party. Under this arrangement there was no serious opposition, and yet there was frequent friction, until in 1897 the first party Cabinet was formed with the approbation of Ito, with Count Okuma as Premier, but it had a very short existence. Then Prince Ito determined to organize a party of his own, a great patriotic party which should never degenerate into partisan tactics. During the fifteen years that have followed that party has three times formed cabinets, but the step which Prince Ito then took toward the dependence of the Cabinet on the popular house of the Diet would seem to have developed into a full constitutional course.

What Congress Is Doing

Mr. Taft has vetoed the Immigration bill, because of the literary test in it. In the Senate, the House (Webb) bill, to prevent the shipment of intoxicating liquor into States that have prohibitory laws, has been passed. No action is to be taken by the House upon the Senate's resolution for a single Presidential term of six years, or upon a proposed substitute exempting Mr. Taft, Mr. Wilson and Mr. Roosevelt from the part which forbids re-election. The House has passed a bill prohibiting the marriage of whites with negroes, Chinese, Japanese or Malays in the District of Columbia. The Senate Republicans have decided to promote the passage of bills for the physical valuation of railroads, a tariff commission, and an eight-hour day for women in the District.

In the Senate, on the 15th, there were services in memory of the late Vice-President Sherman. One of the addresses was made by Mr. Taft. This was the first time in 112 years that a President had spoken directly to the Senate while the latter was in session. Prominent Democrats in the House complain because their party is making appropriations so large that all records will be broken. Provision for two battleships raises the navy's total to $146,000,000, and the pension appropriation is larger than in any past year. Protest was made against the payment of $60,000 for the Pujo committee's expenses, which included $2561 ($500 a day, and cost of transportation) for the specialist who examined William Rockefeller's throat.

The Approach to Constantinople

Our reports of the fighting in the Balkan war come not from correspondents, who are strictly excluded on both sides, but are mainly such as are given out by the authorities at Constantinople and Sofia. Of these the Bulgarians seem to be the more trustworthy, but they report only successes.

For the purpose of strengthening their defenses at the Gallipoli peninsula for the protection of the Dardanelles, a large Turkish reinforcement of two divisions was disembarked at Charkeui, the task taking two days. On the third day the Bulgarians attacked them fiercely as they were moving to Bulair, and, finding themselves likely to be surrounded, the Turks fled in panic to their ships, where they reëmbarked with difficulty under the protection of their guns. The Bulgarians claim to have buried 2500 bodies, and report that 3000 more were scattered over the fields, and that the Turkish loss was 10,000. It is remarkable that several days may pass with scarcely a word of news from the front, whether at Chataldja or Gallipoli, owing to the exclusion of correspondents. The Bulgarians appear to have been pressing forward with success along their new attack on Gallipoli, and have reached Bulair, on the neck of the peninsula, after inflicting great losses on the Turkish troops. At Chataldja the Bulgarians are strictly on the defensive, while the Turks have made sorties, in one of which, on February 9, several thousand Turks are said to have fallen in an attack. But on the extreme right flank the Bulgarians were exposed to a convergent fire from the Turkish warships on the Sea of Marmora, and they retired five miles with insignificant losses.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

V.—The Question of Mediums

What is an advertising "medium"? We hear much about them, among advertisers, but there is much confusion of mind in definition and assay. An advertising medium is, of course, that which conveys the advertising message from the advertiser to the advertisee. But then again we wish to know how well qualified for that service is the alleged, or so-called, medium. And right here we are up against a problem that can neither be guessed nor easily solved.

Nothing in the business world is more fallacious and altogether misleading than the usual supposition that a periodical, for example, has only to attain to a large circulation to become a good advertising medium. Some of the periodicals having the largest circulations are relatively the poorest mediums, for some advertisers. And contrariwise, the paper or magazine with a small or medium circulation will often produce the greater returns for some advertisers.

The readers of a magazine or newspaper may not unfairly be likened to a company of people assembled in a public hall to listen to the exposition of some project or subject. What sort of a crowd is it, and why are they there? Is it a big crowd, gathered together by loud beating of drums, jostling each other, intent upon the comic interludes or the rag-time of a brassy orchestra, coming and going with feverish irresolution of motive? Or is it an orderly gathering of purposeful people, who find seats, study the program, attend to the speakers, and manifest constant interest and enthusiasm?

The first crowd will not be deeply interested in anything that may be said to them in the way of an appeal. The second assembly will. The first crowd typifies the circulation of the great popular periodicals. The second that of the conservative journals, such as THE INDEPENDENT. Advertisers get returns from both kinds of crowds—different kinds of results. The big and uneasy crowd notices the spectacular, and responds to it. They also notice the modest and sedate and truthful advertisements, and some of them respond.

The great majority of the big crowds do not pay attention to what the advertisers have to say, do not see it, do not appear conscious of the advertisements. There is business gathered from these big circulations, of course, but is there adequate business drawn from them? It is doubtful if there is, for the majority of the advertisers and in profitable volume. It has been becoming more and more apparent that the big circulations are not yielding sufficient returns to the advertisers, since the volume of business in these mediums has been steadily diminishing. Much of the advertising in the big mediums is transient. Many of the contracts are not renewed. Of the advertisers of last year but a small proportion are advertisers this year.

With another class of mediums it is different. Their advertisers get returns to justify the expenditure, if they advertise wisely. They stay in those periodicals year after year. They study their audiences, and the audiences are constant enough to permit of being known. They appeal to the people they know will attend to their appeal. They get the returns they know they will get. They are able to put their cases before a body of readers who *read,* and who are buying that periodical because they wish to read it—who buy it year after year as a matter of course, because it is a material part of their lives.

There is a great amount of fustian in the "circulation" question. It is very easy to have too much—and not at all easy to have enough! The big periodicals get too much, of the kind they get. The smaller and more stable periodicals do not get enough, but what they have is 99-100 per cent fine. There is a decided drift of both readers and advertisers toward the smaller periodicals. How pronounced this drift is may not be realized. It may be estimated by such as take note of the volume of advertising in the leading mediums. THE INDEPENDENT, for example, had last month nearly as much advertising as the magazine that a few years ago led the whole field. But there are advertisers in both classes that made good and those that did not; which goes to show that the medium is only one element in advertising success.

IN THE INSURANCE WORLD

BY W. E. UNDERWOOD

Workmen's Compensation Laws in New York

The principle of compensation for injured workmen has become a fixed fact in our social constitution. Political constitutions at variance with it have already become an anachronism, and nothing remains to be done with them but to toss them on the scrap-pile of outlived doctrines. The old common law defenses long resorted to by employers have been swept aside by common agreement all over the country, and in twelve States which have enacted compensation laws they have virtually been proscribed.

Two years ago New York indicated its espousal of the new doctrines governing the relations of employees and employers by enacting the Phillips-Wainwright bill, which was subsequently declared unconstitutional. The present session of the Legislature has three bills before it for consideration: the Murtaugh-Jackson bill, supported by some of the labor organizations; the McClelland bill, backed by the National Civic Federation; and the Foley bill, which has the approval of the New York Insurance Department.

The Murtaugh-Jackson measure in its provisions approximates to a system of state insurance; creates a State Commission of Industrial Accident Awards to administer the fund; and virtually compels employers to cover their workmen's liability in it. The other bills mentioned permit employers to carry their own insurance; to form mutual associations; to contribute to a state fund; or to insure their liability in stock insurance companies.

Our predilections incline to any measure that will most completely and most securely protect the worker; but we also lean to the opinion that the Murtaugh-Jackson bill is too radical, too revolutionary and too monopolistic. State insurance is an untried experiment; evidences are multiplying which indicate the existence of serious defects in the one now being tried by the State of Washington; and we fear that the interests of the workingmen of New York are too large to put at hazard in that way. That system of insurance may eventually prove to be as good or better than those already in use, but we do not believe it should be adopted anywhere to the exclusion of all others. If it is superior in its class it can stand competition. Its victory under those conditions enhances confidence in it.

If Two and Two Were Ten

In last week's *Collier's* appears the second of a series of articles by Arthur E. McFarlane under the comprehensive caption, "The Business of Arson." We learn that in the first article some general proofs were presented, and that on the present occasion those are supplemented by evidence of a special character—testimony from people who should know best: insurance officials and firemen.

The writer makes the technical fire insurance term, "moral hazard," synonymous with arson, after which he proceeds blithely on his way to quote underwriters as authority for the statement that from one-half to eighty per cent of the fire waste of the country is due to systematically planned and deliberately executed incendiarism. "The owner of the property," he says in preparing to make "moral hazard" and arson equivalents, "has his eye on his insurance money. And to say that 'moral hazard' is anything else but that is quibbling and sophistry."

Before quoting his insurance authorities in support of his theories he says "their testimony is the same—tho always for the disagreeable word 'arson' there is substituted that insurance euphemism, 'moral hazard.'" Mr. Amonson, of the People's National, places our fire loss thru arson at one-half; Theodore Stein, president of a small Indiana company, thinks the honest claimants form but a bare majority; a New York general agent is quoted as saying that if the moral hazard were eliminated rates would decline 25 per cent; "reliable insurance men in Canada and the Pacific Coast estimate the percentage of crooked losses at 60 per cent"; A. G. Patton, general rating engineer of the New York Fire Insurance Exchange, is credited with saying it is 67 per cent; George W. Hoyt, second in command of the

United States Branch of the Liverpool & London & Globe, is made to say that the moral hazard losses in America are 70 per cent; and an insurance lawyer, a New Jersey adjuster, a general agent and a New York broker contribute percentages of, respectively, 60, 70, 75 and 80. A great diversity of opinion!

The author of the article himself makes it more than 100 per cent. The estimated fire waste of the United States and Canada runs about 225 millions a year. In his introduction, set in big-faced italic type, Mr. McFarlane says: "When all factors are accounted for, the United States and Canada lose a quarter of a billion dollars annually thru fires either deliberately set or allowed to take place for the collection of insurance. This, too, is the lowest possible estimate."

As Mark Twain observed on a memorable occasion, the report is considerably exaggerated.

The Connecticut Mutual

As stated in President Taylor's report to the members, the Connecticut Mutual Life Insurance Company occupies a distinctive place in the history of American life insurance. Its underwriting principles have undergone few changes in the sixty-six years of its career. They have been developed in the interests of policyholders, but never for any consideration departed from, even temporarily. Thirty years ago the reserve standard of the company, as the result of an exhaustive analysis of the then existing financial, economic and social conditions, was advanced to a 3 per cent basis; and that is today the highest standard of solvency in life insurance in this country. This action was vigorously criticised then as ultra-conservative and unwarranted; but time has proved its wisdom, for within the succeeding twenty-five years, of thirty-three companies that had been computing their reserves on a 4 per cent basis, eighteen had gone to a 3 per cent and fifteen to a 3½ per cent basis.

The company never departed from the principle of computing and distributing dividends annually among its members. The business-getting and asset-building attractions of tontine, semi-tontine and other deferred dividend schemes never affected the Connecticut Mutual. It held steadily to its annual dividend doctrines and became, during a period lasting fully a quarter of a century, an aggressive and an uncompromising foe of tontines in all their bewildering and seductive forms; and it finally witnessed their proscription by statute.

The Connecticut Mutual's record of service to policyholders is a splendid chapter in the history of mutual life insurance. Since December 1, 1846, to December 31, 1912, the company has received premiums aggregating $280,438,556, and has in various forms —death claims, matured endowments, cash surrenders, dividends, etc.—paid policyholders $288,936,237, an excess of payments to them over payments received from them of $8,497,681, to which must be added the sum of $1,793,398 in dividends and interest due members and payable on demand.

The balance sheet of date December 31, 1912, reveals total admitted assets amounting to $69,388,478, a gain during the year of $546,188. The reserve, totaling $63,622,936, increased $725,386, about 75 per cent of which is on the 3 per cent standard. In addition to dividends of $1,793,398, on hand subject to demand by policyholders, there is a net surplus of $3,080,136.

During 1912 the company issued 9922 policies for $23,030,205 of paid for new insurance, and closed the year with 87,449 policies in force for $209,394,597—a gain for the year in number of policies of 3965, in outstanding insurance of $10,239,697.

The Connecticut Mutual has achieved results of the most substantial character. It has from organization to date earned surplus at the rate of 28.87 per cent of its premium income; it has paid it out to policyholders at the rate of 27.14 per cent; it has returned to members benefits equaling 103 per cent of their payments to it; it holds a reserve as a security for its outstanding insurance equal to $302.78 on every $1000; and its total excess payments, plus its present admitted assets, aggregate $77,886,159.

Hanover Fire

An examination of the sixty-first annual statement of the Hanover Fire Insurance Company for the year ending December 31, 1912, shows total assets of $4,985,659, distributed under the following principal heads: bonds and stocks, $3,150,018; real estate, $1,129,473; premiums in course of collection, $428,175; cash in bank and office, $237,270; interest accrued and unpaid reinsurance, $37,223, and loans on mortgages, $3500. The liabilities, including $1,000,000 of capital stock, aggregated $4,074,067, of which $2,701,002 was a reserve for reinsurance; $259,922 were losses in process of adjustment; $68,053 was reserve for commissions and other claims, and $45,000 reserve for taxes. These figures thus yield a net surplus of $911,592 and, as to policyholders, a surplus security of $1,911,592. The growth of the company's business last year is in-

dicated by the heavier reinsurance reserve it is carrying, that fund having increased $425,804. Satisfactory gains were made in premium income and admitted assets as well. The dividends to stockholders for the year were at the rate of 16 per cent.

The National Fire

During 1912 the National Fire Insurance Company of Hartford increased its capital one million dollars, bringing that fund up to $2,000,000. Its total assets made a gain of $3,144,933, going from $11,837,740 to $14,982,673, and its net surplus increased $1,266,929, standing at the end of 1912 at $3,897,205, which, with the cash capital, gives the policyholders a surplus of $5,897,-205. Gauging the progress made in the volume of outstanding insurance by the difference in the size of the reinsurance reserve fund in 1911 and 1912, respectively, it is evident that the National made a substantial gain in new business written, for the increase in reinsurance reserve at the end of the latter year shows at $650,063. The year has been a prosperous one and the financial exhibit indicates a condition of unusual solidity, even in the face of depreciated security values on the date the statement was made.

Connecticut Fire

Conservatism is the keynote of the underwriting and financial policy of the old Connecticut Fire Insurance Company of Hartford. It makes haste slowly. Its progress from organization to date has been steady, slow and solid. During 1912 it increased its volume of outstanding insurance, but the amount was not large, as indicated by an increase in unearned premium liability of only $50,401. The assets increased $217,388 and stood on December 31, 1912, at a total of $7,738,699. With its cash capital of one million and a net surplus of $2,272,925, the policyholders' extra security stands at the handsome figure of $3,272,925—nearly half the amount of the assets.

American Central of St. Louis

With a capital of two million dollars, the management of the American Central Insurance Company of St. Louis concluded in 1912 that the institution should have a larger business. To increase it meant a proportionate inroad on the net surplus, but the management felt that the capital afforded abundant security to policyholders. The business was taken on and the liability for unearned premiums was augmented by $336,936. As it is, however, the surplus to policyholders shows at $2,410,275 out of total assets of $5,562,287. The company's fire loss experience during 1912 was at the rate of 52 per cent of its premiums, and its expense bill at the rate of 40.8 per cent. The expense ratio includes tax items in litigation since 1910 which, altho the company won the suits, were paid in 1912, and resulted in adding about 1 per cent to the year's account.

Notes

The Massachusetts State Fire Protection Association was organized at Boston recently with C. H. Blackall, chairman of the Committee on Fire Prevention of the Boston Chamber of Commerce, president; Charles H. Cole, fire commissioner, vice-president; Charles F. Danforth, secretary of the Massachusetts Mutual Union, and general inspector of fire protection and hazards, secretary. The movement is a coöperative one among members of chambers of commerce, boards of trade, representatives of fire departments, insurance companies, underwriters' associations, industrial and financial corporations and individuals, for the purpose of investigating hazards in an effort to lessen or remove them; to reduce the destruction of life and property to a minimum; to furnish information on the prevention and extinction of fires, the improvement of laws and the general betterment of existing conditions. Meetings will be held quarterly, with the annual meetings in June.

Under the new insurance law of Japan, now effective, life companies transacting business in the Empire are required to invest 60 per cent of their reserves in approved Japanese securities. The Equitable Life Society has discontinued business there and will permanently withdraw. Texas and Japan are not as far apart in some attributes of civilization as they are in distance.

Insurance Commissioner Hardison, of Massachusetts, has approved the application filed by the stock liability companies doing business in that State for a reduction of 25 per cent in all workmen's compensation rates in force on January 1, 1913.

In his annual report Insurance Superintendent Emmet, of New York, expresses an opinion against State insurance as related to fire insurance, adding that it is not an exact science, contains elements of speculation and must be carried on "by men who are willing to venture their private resources in hazards."

Unhappy Mexico

Huerta, as an officer of Mexico's army, was a loyal supporter of Porfirio Diaz. Later, he was loyal to Madero, under whose direction he overcame the rebel forces of Orozco in the north. He fought loyally against Felix Diaz until he realized that this new rebel leader could not be driven from his stronghold in the capital city. The arsenal was practically impregnable. In it were large supplies of arms and ammunition, with food enough to supply the wants of Diaz's men for two months. Repeated assaults upon it had failed. Diaz had lost only 200 men; Madero had lost 2000. Huerta's soldiers were disheartened. Then came Blanquet, with 1200 men, suggesting the deposition of Madero, who had been a failure as President and had no hold upon either the army or the people. Huerta yielded. Madero was deposed and placed under arrest; his brother and his evil genius, "the most hated man in Mexico," was put to death; Huerta and Diaz made an alliance, and Huerta is Provisional President. Ex-President Madero and ex-Vice President Suarez have been killed.

Has peace been restored? Who can tell? Since Madero displaced Porfirio Diaz there has been a rebellion in nearly half of the States, usually a rebellion with no purpose except that which moves a group of bandits. Several State Governments now decline to recognize Huerta. In the north, General Orozco and General Salazar and Emilio Gomez, who asserts that he is Provisional President, are inclined to accept Huerta, but prefer Felix Diaz, General Figueroa has revolted, and it is said that he can gather a large force. There is talk in the north of secession and a new republic. No one seems to know what course will be taken by Zapata, in the south. The country needs a strong man in command. Madero, the spiritualist, who broke his promises and was guided by his greedy and unscrupulous brother, was a weak one. Huerta and Felix Diaz are of another type. They are inclined to use the iron hand, but they have no sufficient or trustworthy army.

The Mexican people sorely need the good offices of their friends abroad. Huerta, Diaz, Orozco, the revolting Governors, and even Zapata, profess to be laboring and fighting for the welfare of their country. How fortunate would their country be if by the unselfish efforts of friends in other lands these warring leaders could be brought into agreement in the interest of peace and upon a common ground of enlightened national policy! If such a mission should be undertaken, those charged with it should be eminent representatives not of the United States alone, but also of two South American nations.

Thanks to the wisdom shown by Mr. Taft, the participation of the United States in such a movement would not now, we think, excite suspicion and resentment in Mexico. Thruout the recent disturbance there

has been no manifestation of anti-American feeling. It is now known that Madero, seeking to bind the army to himself when it seemed to be drifting away, assiduously circulated a report or an assertion that Mr. Taft was about to intervene with troops. But this does not appear to have excited Mexican hostility.

Mr. Taft himself has proved in the last two years, beyond the shadow of a doubt, that he is a true friend of Mexico, moved by no desire to acquire for the United States an inch of her territory, but longing to see her peaceful, prosperous and justly governed. Before he became President he was notably successful in missions which called for tact, wisdom and the arts of conciliation. A few days hence he will lay aside the cares and duties of his high office. Because of his character, his experience and his attitude toward Mexico during the last two years, we can think of no other man so well qualified to offer friendly aid to the embittered factions in that country.

Let us suppose that the temporary Mexican Government should be approached by a group of peace commissioners, led by William Howard Taft, and including eminent representatives of Argentina and Brazil. It may be that Mexican pride or the ambition of factional commanders would prevent the acceptance of aid offered by such a group, but the experiment would be worth trying. And if the friendly aid should be accepted, and if conferences should give Mexico a long peace, with agreement upon a broad and just national policy, the work of that commission would have its place in history and in the hearts of millions of grateful people.

This Mexican condition is most deplorable. After twenty-five years of peace and quiet and prosperity under the tyranny of Porfirio Diaz, during which time it was hoped that the turbulent country had learned the art of self-government, it appears that it has learned nothing. Can tyranny teach liberty? It seems not. The atrocious murders of President Madero and his brother and of Vice-President Suarez excite indignation like that which shocked Europe when King Alexander of Servia and his wife Draga were slain in their palace by assassins in the interest of the present King Peter. Our own Government may or may not be involved in the disorders that will further follow; but this is the great lesson to be learned, that peace resting on force is not to be trusted. Diaz did not regenerate Mexico. It is only universal education, teaching self-control, moral as well as that of reading and writing, that will save a state. Mexican civilization rests on a volcano, and the volcano is now in eruption.

In the government of Porto Rico and the Philippines our nation is taking the right way to provide for ultimate self-government; and that is by education and the practice of peaceful provincial and local government. Mexico will not be a safe place to live in till its peasants are educated. It would be a blessing to Mexico if a similar regime could be inaugurated there, and we do not believe that any European power would hesitate to approve, under the present deplorable circumstances, our forcible intervention; but that is not our duty. Mexico is an independent nation, and only extreme necessity would warrant what would be a real blessing to that distracted country. For the present, and we hope permanently, we must keep hands off, however much Americans in that country may desire intervention and even annexation.

The President's Veto Sustained

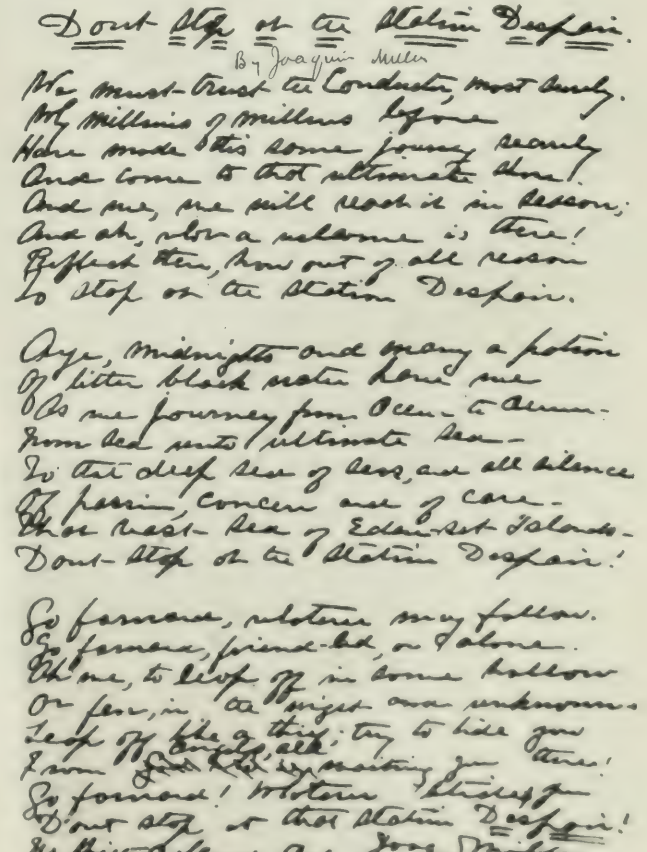
It was almost more than was to be expected that the President's veto of the immigration bill would be sustained; but it is a matter for profound satisfaction that the House of Representatives refused to override the veto. The one point in dispute was, whether the literacy test should be required, shutting out any who cannot read. But why can they not read? Simply because their countries have been governed by an aristocracy of wealth and learning who wished to keep their numbers, as did the Demo-

crats in Massachusetts in the old Whig days, "conveniently small." It was the tyranny of the few that kept the many ignorant. When these poor and illiterate peasants have wished to come to this land of liberty and free schools, and were glad to pay abundantly for the privilege in doing the humblest work, we have gladly welcomed them to what we called a land of liberty, a refuge for the opprest; and Congress so far forgot itself as to enact a law reversing all our old policy. But a second thought has saved our honor and our pride.

The aged Pope Pius X laments the death of his beloved sister, and sympathy goes to him. She was one of those whom the literacy test of the immigration bill would have shut out from this country.

Joaquin Miller

The death of Joaquin Miller at the age of seventy-one leaves no American poet his equal. We remember him as he first appeared above the literary horizon. He broke upon us from the Far West as the Poet of the Sierras. His first poem was "Arazona," thus misspelt. He came to the conventional East with the affectation of a cowboy, his trousers tucked in his high boots, and his long, brown hair rolling up over his shoulders, and odd stories were told of his unconventional doings at functions where he was entertained. His name he had changed from the absurd classical Cincinnatus to the Mexican Joaquin. But it did not take long for him to visit barber and tailor, and soon he was drest and shod like the rest of us.



But there was very little of the wild West in his poems or prose sketches. His pen did not assume the style of the rude miner or the Chinaman, as did that of John Hay or Bret Harte, men who perhaps taught Kipling to use the dialect of Tommy Atkins. Joaquin Miller's taste was not rude, and he did not care to embellish splendid ignorance with rime. His topics were those of common humanity—love, courage, truth, honor; their lessons told as other poets have told them, vigorously, decently, and with an unusual native sense of the sweetness of honeyed words. The sense of verbal music was remarkably developt in him. His style was copied from no poetic model; but he was steept in the splendid imagery and stories of the Bible.

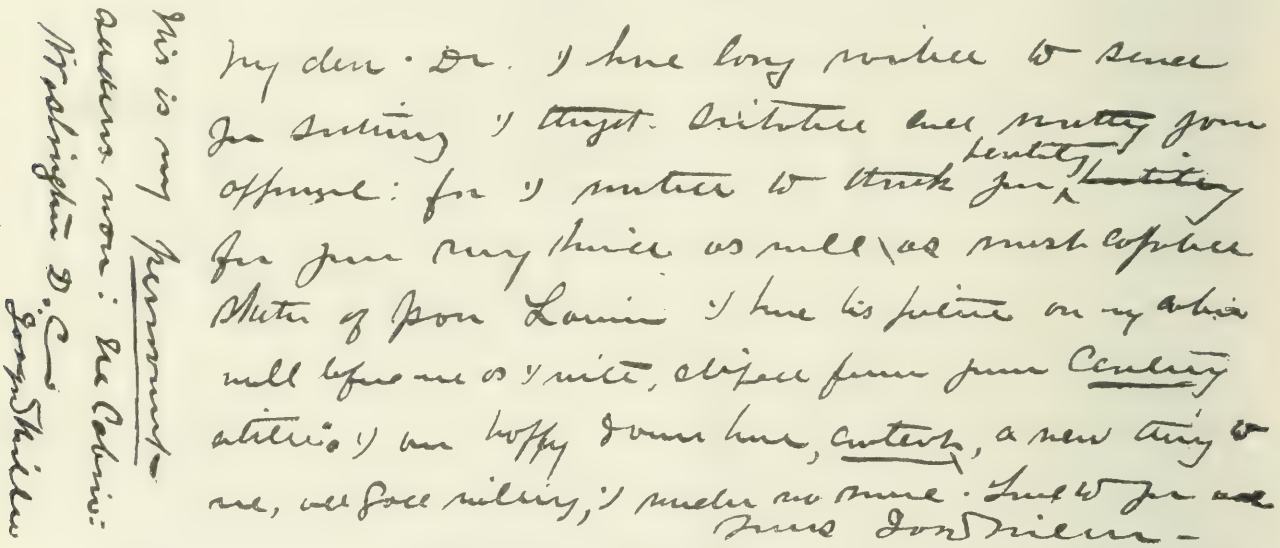
The Western magazines, not knowing that of which they speak, have been accustomed to assert that Joaquin Miller never received due recognition in this country as a poet, except in California. It gives the lie to this charge against Eastern editors to state that nearly thirty years ago, in two years alone, THE INDEPENDENT publisht thirteen poems from his pen, and these were followed by a long series of descriptive prose articles. Here is one of the most vigorous of his poems, printed in THE INDEPENDENT, March 23, 1881:

TO RUSSIA

"Where wast thou when I laid the foundations of the earth?"

Who tamed thy lawless Tartar blood?
What David bearded in his den
The Russian bear in ages when

Dont stop at the Station Despair.
By Joaquin Miller
We must trust the Conductor, most surely.
My Millions of millions before
Have made this same journey securely
And come to that ultimate shore.
And we, we will mark it in passing,
And oh, what a welcome is there!
Refresht then, how out of all reason
To stop at the Station Despair.



Aye, midnights and many a portion
Of bitter black water lave me
As we journey from Ocean to Ocean
From bed unto ultimate sea—
To that deep sea of Rest, and all silence
Of passion, concern and of care.
That vast sea of Edenest Islands.
Dont stop at the Station Despair!

So forward, whatever may follow.
So forward, friend-led, or alone.
Oh me, to sleep in some hollow
Or fear, in the night-wet unknown
Leap life like a thief; try to hide you
From God? Like a coward desert?
So forward! whatever betide you
Dont stop at that Station Despair!
Yr Hijo Colonel Col. Joaq Miller

JOAQUIN MILLER'S CHIROGRAPHY WAS THE DESPAIR OF PRINTERS

You strode your black, unbridled steed,
A skin-clad savage of the steeps?
Why, one who now sits low and weeps,
Why, one who now wails out to you:
The Jew, the homeless, hated Jew!

Who girt the thews of your young prime?
Why, who but Moses shaped your course
And bound your fierce, divided force,
United, down the grooves of Time?
Your mighty millions all today
The hated, homeless Jew obey.
Who taught all histories to you?
The Jew, the hated, homeless Jew!

A NOTE FROM JOAQUIN MILLER TO THE EDITOR; NOT SO EASY TO READ AS IT LOOKS

Who taught you tender Bible tales
Of honey-lands, of milk and wine,
Of happy, peaceful Palestine,
Of Jordan's holy harvest-vales?
Who gave the patient Christ, I say?
Who gave you Christian creed? Yea, yea,
Who gave your very God to you?
The Jew! The Jew! The hated Jew!

But if THE INDEPENDENT was for years so partial to Joaquin Miller, to prepare his manuscript for the press was the task of the united editorial board. He was hardly the product of the schools, tho not uneducated, and he could not spell, and his writing was the most careless and illegible that ever came to this office. His prose was harder to decipher than his poetry, and it was the editor's duty to guess and rewrite with a pencil many a word over the line to save the compositor from profanity. When Bishop Gilbert Haven once climbed to our composing room he remarked to a compositor, "You are pretty near Heaven up here." "Nearer than you will ever get if you send such copy," was the reply. Horace Greeley's cacography is famous, or infamous; but it was not so hard to read because he formed every letter after his own system, and you only had to learn his alphabet. Dean Stanley's manuscript was a fearful puzzle to our editors and printers, yet it had a scholarly distortion which gained it absolution; but Joaquin Miller's deserved no pardon. It skipt letters or ran a meaningless stub line where letters he was not sure of ought to be; but when we had read or guessed it he was forgiven.

As a man Joaquin Miller was gentle and lovable, even when he transgrest conventions. He spoke for justice, and particularly for the Indians, who were his friends. He loved to be with them. In his later life he retired to a ranch on a knoll near San Francisco, where he built a group of very small houses for himself and friends, and he surrounded them with thousands of roses and trees planted with his own hand and watered by a maze of pipes from a higher source. There he lived as a retired philosopher, a western Thoreau, a more musical Whitman, or like our own John Burroughs, welcoming many visiting pilgrims to his blossomed shrine. For two years he had suffered from paralysis, but we have heard whispered his hope to conclude his greatest poetical work, which he would show no one. But death unlocks cabinets. The

Aeneid Virgil wished burnt because it was not filed smooth to his liking.

Defacing the Czar's Portrait

The Russian Government decided to commemorate the third centenary of the Romanoff dynasty by issuing at the beginning of the year a series of postage stamps which bore the portrait of the reigning Czar and his distinguisht ancestors instead of the coat of arms, but the new stamps have been withdrawn because the loyal Russian people would not consent to sully the sacred image of their sovereign. Postoffice officials and clerks even in the central office at St. Petersburg refused to cancel the stamps. Several Orthodox bishops sent in energetic remonstrances against the "outrageous indignity" and demanded the immediate withdrawal of the issue. The True Russian press attacked the Government for its action, declaring that it had attempted to undermine the love of the people for their emperor and had given new encouragement to the hydra of revolution. One Russian journal suggested the substitution of the picture of Tolstoy, whom nothing could further defile.

We Americans, who lick George Washington and blacken the face of Benjamin Franklin without the slightest compunction, are inclined to smile at these instances of Russian iconolatry, but it is a failing common to human nature everywhere and there are many indications that we are not free from similar superstition. Think for example of the thousands of magazines which have been debarred from the mails because the Star Spangled Banner was displayed on the cover of the Fourth of July issue. In Panama not long ago a vaudeville performer coming too close to the footlights accidentally stept on a Panaman flag draped over front and there was danger of international complications until he amended his error by kissing the flag! A prominent labor leader was furiously denounced as a traitor to his country because he spoke from a stand decorated with the American flag and photographs were publisht to prove that his foot actually touched it. It is quite possible, but if organized labor never does anything more unpatriotic than to step on the flag we shall be greatly relieved. Our revolutionary ancestors used the Stars and Stripes for rugs, tablecloths, handkerchiefs and waistcoasts and thought thereby to honor it, but it appears they did not know what patriotism was in those days. A New Jersey town was recently thrown into excitement because an English boy in the public school refused to swear allegiance to the American flag. The proper way to look at it would be to have excluded him from the privilege and reserve the ceremony to those who are or intend to be American citizens.

It sometimes seems as if superstition, now being eliminated from religion, is going over into patriotism. At this rate it will not be long before we reach the level of Holy Russia.

The Pribiloff Seals

By far the most important and remarkable zoological preserve on the face of the earth is the two Pribiloff Islands, which came into the possession of the United States with the purchase of Alaska. To those islands the seals from more than a thousand miles away flock to bring forth their young on land. They are polygamous, and they congregate in the summer in families, one strong male ruling on an average fifty females gathered about him. In 1870 there were about 2,500,000 seals gathered in the islands; the weaker or younger males were driven off from the breeding families and herded separately by themselves. These are the superfluous bachelor males.

For years our Government leased the right of killing these superfluous males, to the number of 100,000 a year, to a company, it being forbidden to kill any females, or any males less than two years old. Whether they confined their killing to the legal limit is not now of our concern. Several

years ago our Government ceased to renew such leases and have since had agents in the islands to kill useless males and sell the skins. During all these years we have received over $10,000,000 from leases and sales.

But the number of seals has steadily decreased from 2,500,000 to the present number of 215,000. The reason for this loss is not the killing on land, but the killing in the ocean and out of season. Canadian and Japanese sealers created a great and profitable industry in hunting the seals on their feeding grounds. Those killed were mostly females. Of those shot and killed in this pelagic sealing not half were secured, and for each of these killed there was the loss of two young, one born and one unborn. We trust wholly the report of President David Starr Jordan that this is the full cause of the rapid diminution in the number of seals.

By a treaty of 1911 with Russia, Great Britain and Japan pelagic sealing is forbidden for fifteen years. The enforcement of this provision is the only assurance that the seal industry will not be utterly destroyed, and the most wonderful of animal preserves with it. As this prohibition would be wholly to the advantage of the United States, and to the loss of other nations, the treaty allowed Great Britain 15 per cent each of the product of the land sealing.

But a law was enacted last year at Washington, by some mistake, to prohibit all land sealing for five years. This is unfortunate for several reasons. It will stop the annual payments to Great Britain and Japan, and they would have a good right to abrogate the treaty on the ground that we had not kept our agreement. Pelagic sealing would then be resumed, with the extermination of the herd. That law of last year ought to be immediately repealed. There is absolutely no reason to forbid the killing of the superfluous males. It does not reduce the number of young seals. If 30,000 useless bull seals were killed every year the Government would receive for the skins $1,200,000, to say nothing of the subsidiary animal life which depends on it. The blue foxes are bred there and feed on the carcasses left over in the winter. The fox-pelt is worth as much as a seal-skin, and 40,000 have been taken in forty years, with increasing numbers until this year, when they are being reduced by starvation. For these reasons we urge the immediate repeal of the act; and in doing so we express our surprise that a majority of one in the Congressional committee could not have seen, as the other three did, the absurdity of trusting an agent of the company which had leased the islands, and made their profit out of it, instead of such competent experts as President Jordan, who made his earlier fame as an ichthyologist, and Charles H. Townsend, director of the New York Aquarium, who by a study of thirty years has made himself the leading American authority of sea-fish, and, by visits to the Pribiloff Islands, of the habits of the seal as well. These men have no financial interest to care for, only the interests of the country in the preservation of this most interesting and important zoological preserve.

From the Dark Ages

In the days of Henry Clay Trunbull we could expect good archeology, good science and reasonable theology in the *Sunday School Times,* but such an article as that in the last number by an S. T. D. with the title "Was the World Created in Six Days?" is simply discouraging. It does not understand that the first chapter of Genesis is to be interpreted by literary sense and not by selecting from the dictionary any definition of "day" that may best fit the doctrine of inspiration which the writer chooses to accept.

The plain meaning of the story is that when God began to create, to "carve out," the heavens and the earth he found the material a chaos "without form and void," as in the earlier Babylonian cosmogony, and that in a succession of six ordinary days having each a morning and

an evening he organized it into a world of light and continent and ocean and clouds and vegetable and animal and human life. Of course, it was not all done in six days, as every common school teacher now knows, but not every S. T. D., for the writer is allowed to try to show how it might have been that in six successive days all this was done, and that, too, following the geologic periods between the first verse when "in the beginning God created the heavens and the earth," and the first day of the third verse; just as if there had been no succession of day and night before the creation of man. The science is an utter hodge-podge, and it is only right to warn the innocent reader not to be misled by it. Take this statement about the fourth day as a specimen:

> Science believes that there came a time when the axis of the earth was suddenly changed, and consequently the climatic zones were changed, becoming as they are today. If this was done on the fourth day, it could have occurred in a comparatively short time.

That bit of news will startle the astronomers.

Hobson's Council of National Defense

In our editorial "The Specter of Militarism," publisht two weeks ago, we stated:

> The Navy League is spreading broadcast a petition for a council of national defense, to be composed largely of military men. Everyone knows what such a council will urge.

Arthur H. Dadmun, Secretary of the Navy League, writes us:

> But four of the sixteen members of the proposed council are military men, so I think you should correct the above statement, which is manifestly erroneous.

According to the Hobson bill, as now amended by the Committee on Naval Affairs and reported favorably to the House, the following sixteen men will constitute the Council of National Defense: The President, the Secretary of State, *the Secretary of War, the Secretary of Navy,* the chairmen of the Senate committees on Appropriations, Foreign Relations, *Military Affairs* and *Naval Affairs,* the chairmen of the House committees on Appropriations, Foreign Affairs, *Military Affairs* and *Naval Affairs, the chief of the General Staff of the Army, an officer of the navy not below the rank of captain, the president of the Army War College and the president of the Navy War College.*

We have italicized the gentlemen in the above list who we think might reasonably come within the "military" category, omitting the President, altho he is Commander-in-Chief of the Army and Navy. Even so we find ten "military" men out of sixteen on the "council."

We still submit, therefore, that it will not require the services of a soothsayer to predict what such a council will urge, and we beg leave to add that it will not be a reduction of taxes.

Another Greek Temple

And whom do you suppose it is in honor of this time? Why, the American Indian, to be sure! Just what we might expect from our American architects, isn't it? Not so inappropriate, tho, as the Hellenic monument to be erected to Lincoln at Washington, for there was a good deal of the Indian in the make-up of the ancient Greek, both morally and physically. Young Benjamin West, fresh from the wilds of Pennsylvania, when he saw the Apollo Belvidere for the first time exclaimed, "Why it is a Mohawk brave!" a remark which shocked and amused the eighteenth century cognoscenti very much.

The million immigrants who enter the Narrows of New York Harbor every year will expect to see an Indian the first thing and so they will; two of them, in fact, one a bronze equestrian statue down in front trying to look as much like a Roman general as possible, the other, a colossal bronze figure surmounting a portico and peristyle of sixteen Ionic columns. The monument is the gift of Rodman Wanamaker, and

President Taft broke ground for it last Saturday in the presence of thirty-three chiefs in full feather, many of whom had fought against the white man in days gone by.

Dr. Joseph Kossuth Dixon in the opening speech said: "So far as can be learned never before in the history of mankind has a monument been erected to a race of people." This is a very startling statement. We had hitherto supposed that monuments to the Indian were not uncommon in America, altho in recent years the tobacco trust has suppprest most of them. But leaving the wooden Indian out of consideration, some of our best sculpture has been inspired by the aborigines. To mention only the largest and latest of our Indian monuments, what is the matter with the colossal concrete statue erected by Lorado Taft on the bluff above Rock River, Illinois? To our mind this possesses most of the virtues that are lacking in the monument designed by Thomas Hastings for the entrance to New York harbor, tho that is giving it very high praise. It is original, indigenous, appropriate, impressive and imperishable. If we had more men of the courage and insight of Lorado Taft there would be less danger that the archeologists of the future who excavate the ruins of our civilization would classify us as a Greek colony of the most decadent period of the Hellenistic Age.

Our Vacation Number

One number, every year, our readers have a chance to make better or worse than the other issues, which we plan and issue without their collaboration. This issue is the Vacation Number, which never fails to interest us. In 1913 its date falls on June 5.

But we must receive your contributions long before June; by the 1st of May we want to have all the material in hand. First of all, the photographs. Last year we asked for pictures containing water—or suggesting it somehow. This year we want trees. Trees are an ideal subject in photography. Are you impressionistic? Look to their high flung branches. Are you Dutch in your inclination—fonder of Cuyp and Vermeer than of Monet and Manet? Then photograph the trunk of the old beech-tree by the mill. Cubists alone will be baffled by tree-forms. But not all of the photographs we hope to see will be tree-portraits, primarily. In some of them the major interest will be animal life, or human life or habitations, in the foreground. Not that personality is lacking in trees; Hawthorne knew better than that, and so does every woodsman.

Prizes will be awarded for the best photographs we receive—one prize of $15 and one of $10. For all others two subscriptions for one year will be awarded, when work is reproduced which does not win a prize. There is one caution: if you wish us to return photographs unused, you must enclose a fully addrest and stamped envelope with them. And on the back of each please explain fully what the picture is and add your full name and address.

Besides the photographs, our readers annually send us, for this Vacation Number, a great many letters; or, if you prefer to call them that, short contributed articles, based on your own vacation experiences, told just as you would tell them to a good friend. We cannot specify the most welcome contents, for we love variety. Humor, practical hints as to ways to enjoying one's outing but above all, *personal* feeling. This is not an invitation to professional writers. Professionals are not excluded, but neither are they doubly welcome. We want our amateur subscribers to respond this time. Their accounts of vacation experiences or reflections upon them may be as short as they know how to make them, or anything up to 500 words in length. They will have to be very good to exceed that length, and yet prove acceptable. The prizes for these little articles are in the same amounts as the prizes for photographs. Also, anything printed but not given a prize will be recognized by subscriptions. Illustrations furnisht by the contributor will add

to the chances of winning a prize. Do not use photographs as illustrations in this department if you can offer us, instead, pen and ink drawings, or pencil sketches, or any other distinctly *personal* illustration. Most of us can take fairly good photographs; the few of you who can use color or black and white owe it to our friends not to hide your light under a bushel. Yet we do not scorn interesting photographs, by any means, and the written accounts of vacations, which we hope to receive, with or without pictures, are absolutely unrestricted as to style, scene and scope.

Do not put off doing the good deed. Begin your contribution to the Vacation INDEPENDENT *now*. Please address pictures or text to the Vacation Editor.

The Korean Conspiracy Case

The facts given in the article this week by Mr. Pieters on their face raise the grave suspicion that torture was actually inflicted on the prisoners charged with conspiracy to kill Governor-General Terauchi. This suspicion does not so much depend on the unanimous assertion of the hundred and more prisoners that their confessions were forced by torture as on the failure of the Court of First Instance to meet this charge, and on its refusal to call witnesses for the defense. The case has been dragging on before an appellate court, and there the prisoners have again been questioned after the French style of procedure adopted in Japan, and witnesses have been called, but no decision has been rendered. We sincerely hope, for the honor of Japan, that either the charge of torture will be disproved, or, if it prove true, that those police officials guilty of it will be properly punished. This we must believe will be done, for we have no question of the desire of the rulers in Japan to adopt civilized methods in the prosecution of justice.

The only excuse for such torture, if it were really used to force confession, is that it has been of old times the practice in both China and Korea; and Japanese officials in Korea may have been tempted to use the old Korean way in a case that seemed of so great importance. But we wait for the conclusion of the present trial before saying anything further, except to note that the conduct of the judge in the Court of Appeals has universal approval for his fairness and patience; and that the lawyers for the defense seem to be depending not wholly on success in disproving the charge of conspiracy, but are also trying to prove that this was a political conspiracy, and is not to be tried as an ordinary criminal offense.

In Brief

Wiliam H. Taft, '78, Professor of Law, $5000 a year; Howard H. Jones, '08, football coach, $4000 a year.—New Haven *Dispatch*.

"Now what do you think of that, my cat,
And what do you think of that, my dog?"

General Huerta, who has seized the Presidency of Mexico, reports to President Taft his accession and adds that "from now on, peace and prosperity will prevail." We wait anxiously to see it.

It is a curious law lately past in the State of Washington which forbids the intermarriage with those not of the white race unless both are citizens of the United States. It is intended to apply to marriage with Japanese.

The week has brought absolutely no reliable news of fighting in the war against Turkey. The weather has been most unfavorable, and it is suspected that negotiations are being carried on looking towards the submission of Turkey to the terms of the four allies.

At last the friends of temperance have succeeded, against great opposition, in enacting a law which allows prohibition States to prevent the admission within their borders of intoxicating liquors in express or other packages. We shall now learn whether it is constitutional.

We have already warmly approved the request for incorporation, as at present guarded and controlled, of the one hundred million Rockefeller foundation for benevolent purposes. It has been refused incorporation once by Congress, from fear that it might do something dangerous, but those dangers are now eliminated, and the Senate committee, in recommending it, wisely remarks that if Mr. Rockefeller preferred

he could tie this immense sum up for half a century for purposes not to be approved. As it is, the purposes are good, and the election of new trustees must be approved by the President, the Chief Justice, the President of the Senate, and the Speaker of the House, and the presidents of the universities of Yale, Harvard, Columbia, Johns Hopkins, and Chicago. That makes assurance doubly sure.

The Senate of the great State of Ohio has ratified the amendment for the popular election of Senators. Other States are likely to follow, giving us the Eighteenth Amendment. It is not so very hard to amend the Federal Constitution, and there is no difficulty in amending State constitutions, if the people really want to do it.

The passage, under the influence of Governor Wilson, of the "seven sisters" bills relieves the State of New Jersey of the long discredit of being the State to which corporations have resorted for privileges, which they ought not to possess. These acts will cost the State money, but give it honor. Now the corporations will flee to West Virginia for their next best chance for privilege.

We have previously told of the union of several denominations in China in theological education, and of the plans proposed for union of several theological seminaries in California. Dr. Dunning tells in *The Congregationalist* of the hopeful success of the union of Presbyterians, Methodists and Congregationalists of Canada, in consolidating their theological seminaries affiliated with McGill University. The plan is already in operation and is working successfully, and the Episcopalians are at present considering whether they will join the forces with it.

The report that Dr. Sun Yat-sen, the first President of China, was to visit the United States, we took pains to deny several months ago. Since then he has been engaged in a project to develop a system of railroads in China. Now he has been sent to Japan to develop commercial and political agreements with that empire, and, it is believed, to try to secure recognition of the republic. But it is much to be desired that the United States should be the first to recognize the Republic of China. It is only a few years ago that Japan was at war with China. Can it be that our country has been waiting till China were forced to accept the terms for a loan imposed by the six powers?

It is a slight relief to the deep disgrace of barbarism to know that the number of lynchings in this country is sensibly diminishing, as we think it is also in Turkey. The recorded number in 1892 was 235, and the next year 200. In 1908 it was 100; in 1909, 87; in 1910, 74; in 1911, 71, and in 1912, 65. Of these last, 11 were in Georgia, 5 each in Alabama, Mississippi, South Carolina and Tennessee, while there were I each in the Northern States of North Dakota, Oregon and Wyoming. Of the entire number 15 were white, and of the 50 negroes 3 were women, and 12 were charged with assaults on women.

Millions seem to be cheap and easy when it comes to education. The University of Pennsylvania asks for an endowment of twenty millions, and is not unlikely to get it. For the endowment of its incorporated colleges for negroes in the South the American Missionary Association asks only a million to be distributed between half a dozen of them; and the Congregationalists are talking about raising a million for starting new churches in cities.

Our journals are properly full of the civil war in Mexico. It is at our borders. A penny near the eye hides the sun. But the Mexican war is of no importance in the world's history; it is out of the current; it will change nothing. But the Balkan war is a very different matter. It creates history; it affects the destiny of nations for thousands of years. It helps liberty; it overthrows long tyranny. It lifts life and progress in the place of stagnation. If we looked at things as they are, we should have pages and pages on the Balkan war, and give but stray items to the Mexican news.

Were we a Rockefeller and possessed of uncounted millions, and not anxious to let our neighbor's right hand know what our left hand was doing, would not we try a little international business just now? Here is China, desperately anxious to open her country and to protect her borders against rapacity, and there is a group called the six powers which, like dogs in a manger, refuse to allow the young republic to borrow the money which would give it zest and strength. Would we, if we were that imagined Rockefeller, step in quietly and relieve the harassed republic? Would a group of banded multimillionaires who had the world vision do it? We don't know; perhaps one of these days such a thing might be. If Madagascar could only have found such a friend in her fatal peril!

Twelve Major Prophets of Today—VII

by Edwin E. Slosson, Ph.D.

Rudolf Eucken

Rudolf Eucken
H. G. Wells
G. B. Shaw
G. K. Chesterton
F. C. S. Schiller
John Dewey

To the history of and criticism of these conceptions and their terminology Professor Eucken has brought thoro and careful reading, acute and candid criticism, and a clear and solid style. While he is at home among the systems of the past, he seems equally familiar with the controversies of the present. Above all, he has studied brevity, and has mastered the art of expressing in a few words the results of patient research and critical discrimination.

The writer of this notice was constrained to recommend the work for translation to his friend and former pupil by his estimate of the intrinsic value of the treatise and the desire that it might be brought within reach of English readers as eminently suited to the times. He can say with assured confidence that there are few books within his knowledge which are better fitted to aid the student who wishes to acquaint himself with the course of superlative and scientific thinking and to form an intelligent estimate of most of the current theories.*

These were the words with which Professor Eucken was introduced to the American public thirty-two years ago by one who was a good judge of men and books, the primary qualification of a college president. Now again Professor Eucken has come to America; this time in person, but under the auspices of Harvard and the University of New York, instead of Yale. This time he reaches a larger audience; partly owing to his greater fame, partly to a change in the popular attitude toward the views he presents. Four years ago, when Eucken received the Nobel prize for the greatest work of idealistic literature, there was no book of his accessible to the English reader, for the translation instigated by President Porter was out of print. Since then all his important works have been brought out in England and America; and the periodical indexes record a growing interest in his thought, corresponding to that which is manifested in Germany.

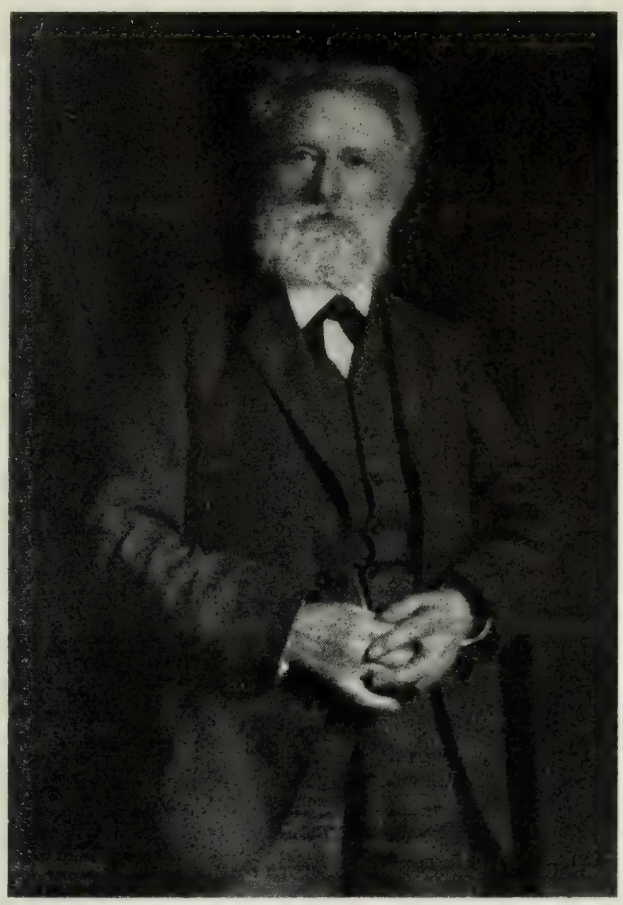
The Nobel prizes have failed to carry out the intention of its founder, which was to place $100,000 or so immediately into the hands of a man who had made a signal contribution to science, literature, or peace. Instead of this, the Nobel committees absorb a liberal moiety of the income of the fund in local "administrative expenses" and usually give the residue, now amounting to some $37,000, to men whose reputations have long been establisht; for example, in literature, Sully-Prudhomme, Mommsen, Björnson, Mistral, Kipling, and Heyse. But in so interpreting their mandate the Nobel committees have fulfilled another useful function, possibly as much needed as that conceived by Alfred Nobel. If they have not discovered original genius, they have at least pointed it out to the world at large. The men thus distinguisht as having contributed to human progress have extended their influence over their contemporaries, as well as received a due appreciation of their efforts. The Nobel prize does not add to the stature of a man, but it does elevate him to a pulpit.

In the case of Eucken the value of this is evident. He did not need the assistance of the Nobel fund in order to prosecute his researches, for the laboratory expenses of a meta-

**The Fundamental Concepts of Modern Philosophic Thought, Critically and Historically Considered.* By Rudolf Eucken, Professor in Jena. Translated by M. Stuart Phelps, Professor in Smith College. With additions and corrections by the author and an introduction by Noah Porter, president of Yale College. Appleton: 1880.

physician are but slight, and Jena is as cheap a place to live as can nowadays be found in civilized lands. The award of the prize did not, of course, add to his reputation in philosophical circles, but Eucken does not believe that the influence of a philosopher should be confined to philosophical circles. He repudiates entirely the aloof, impartial, disinterested spectator attitude which philosophers in general have thought it necessary to pretend to assume. The question is, in short, what kind of a scientist the philosopher should imitate: the chemist who transforms the world in which he lives, or the meteorologist who merely records the atmospheric currents without attempting to guide them? Eucken is not only a teacher; he is a preacher. He has a message which he believes of vital importance to his contemporaries, so it cannot be a matter of indifference to him that he is, in his later years, gaining a wider audience, that his works are the most widely current philosophical writings of the present day in Germany,* and are being extensively translated into other languages.

This growing popularity is all the more noteworthy since it is not attained by any novelty of form, or even brilliancy of style. Eucken never tries to stimulate thought by shocking the reader with audacious paradoxes, as did Schopenhauer and Nietzsche, as do Shaw and Chesterton. He has none of the freshness of phraseology and wealth of novel illustrations which attract to James and Bergson their wide circle of admirers. He does not, like Ostwald and Haeckel, make use of the direct and concrete mode of expression which has been introduced into literature by m o d e r n science. Eucken always writes in a serious and methodical style, elaborating his line of thought as he goes along with exactness and just proportion; expressing himself in general and abstract terms, rarely making use of imagery or concrete illustrations, never introducing personalities. A sweeter-tempered philosopher never lived. He speaks no evil, even of the dead. He indulges in no polemics with his contemporaries. In his historical works he passes thru all fields of thought, gleaning good grain wherever he goes, and saying as little as possible about the tares and brambles that he finds with it.



Very curiously, it has been Eucken's lot to have been closely associated, on the faculties of small universities, with the two men whose views are most antagonistic to his: at Basel with Nietzsche and at Jena with Haeckel, and he has been on the best of terms with both of them. I was particularly interested in what Professor Eucken told me of Nietzsche, whose personality and philosophy were in such violent contradiction. This advocate of ruthless brutality, this scorner of sympathy and compassion, was in reality a most tender-hearted man, but too shy and sensitive to be popular; and when his feelings were hurt he wrote down in a passion what he felt at the moment.

At the University of Basel Professor Eucken often served with Nietzsche on the examining committee of candidates for the doctorate in classical philology. On such occasions, if the student appeared to be getting the worst of it in the verbal contest, Nietzsche would be observed to become more and more nervous until, finally, he could contain himself no longer and would break in with leading questions: "I suppose you mean so-and-so?" or "Do you not believe this or that?" until he got the student to say just about what he should have said in the first place. Professor Eucken does not regard the widespread influence of Nietzsche as altogether evil, believing he should not be held responsible for all the vagaries and extravagances of his devotees. The reason of Nietzsche's popularity, according to Eucken, is his strong individualism; for the Germans, in spite of governmental control and the Social Democracy, are pronounced individualists in character. The German will insist upon having his own house, his own seat, his

*So says Professor Heinrich Weinel in an interesting article on "Religious Life and Thought in Germany To-day," in the *Hibbert Journal*, July, 1909.

own opinion. This sounded strange to the American, accustomed to have Germany referred to as the most regimented of nations.

But modern Germany is a land of incongruities and contradictions, a wild confusion of swirling cross-currents. The increase of population, the checking of emigration, the amazing prosperity, the extension of commerce, the demand for territorial expansion, would indicate a sound physical constitution and a healthful growth. The immense sale of serious works on religion and philosophy shows a revival of interest in spiritual affairs. Yet, if we were to judge of the character of the people by the most conspicuous of its achievement in art and literature, we should say that modern Germany is hopelessly decadent and corrupt. In drama and fiction Gallic license is allied with Gothic coarseness. In art hideousness and viciousness are depicted by means of strange and violent methods. Germany of to-day, as seen by the tourist, is a land of spotted painting, spotted literature, and spotted faces.

Mit besten Grüßen
Ihr ergebener
Rudolf Eucken

In the little university town of Jena the incongruities of modern Germany are curiously conspicuous. In this historic stronghold of Protestantism, this leader in the Enlightenment, the home of Goethe, Schiller, Novalis, Fichte, the Humboldts, Hegel, Schelling and Wieland, the barbarous customs of the past have the strongest hold. A student is likely to miss his 7 o'clock Wednesday lecture on the spiritual life because he sat up till 2 o'clock drinking compulsory beer with his corps brothers in the middle of the market-place. And he may cut his 8 o'clock Saturday lecture because he has an imperative engagement to cut off the nose or the ear of a fellow student at the Mensurort of Wöllnitz.

Among the nobler manifestations of the spirit of new Germany the tourist is likely to take most interest in the architecture. Here, indeed, he will find much that is displeasing and eccentric, but that in itself is encouraging, for it shows that we are in the presence of a living art which is not content to keep to the safe and beaten paths, but would strike out new ways for itself. In city and country unexpected forms and colors delight the eye on villa, monument and public building; new and ingenious solutions of problems as old as man. The modern German architect is not the imitator, but the rival, of the master builders of the past. He knows how to harmonize the old with the new, utilizing the old to give him inspiration, but not permitting it to hamper him. A striking example of this is the new university buildings of Jena, erected on the 350th anniversary of the university in 1908. The whole group cost only $375,000, not so much as some

single buildings in our leading universities, yet I know of none more satisfactory from both the utilitarian and the esthetic point of view. Here the problem of harmonization was particularly difficult; not only must the new buildings fit into the picture of old Jena, but a tower of the ancient ducal castle was actually to be incorporated. Yet the architect, Theodor Fischer, has made no sacrifices to the spirit of antiquity. At Oxford the newer buildings either clash violently with their elders or imitate them so closely as to be almost equally inconvenient and uncomfortable. The Jena buildings look as tho they might well have been built by Kurfürst Johann Friedrich der Grossmütige in 1558, but are up to date, commodious, hygienic, well ventilated, steam heated, equipt with electric lights and clocks, and electric vacuum cleaners.

There are no superfluous statues stuck around in niches and on pedestals. The adornment, plastic and polychromatic, is strictly structural. It is put where it belongs. With the possible exception of a Rodin bust of Minerva in the vestibule, I did not see any "objects of art" that I could have carried off without tearing down the building. On the stone of the north façade are roughly chiseled the Ephesian Diana in the gable, and, beneath, four Egyptian-like figures representing the four faculties. That of *Philosophie,* with solemn and inscrutable face, is very appropriately nearest to the lecture room of Professor Eucken. As we enter we see opposite the portal to the *Aula,* the university hall of state, on either side of which are gigantic paintings emblematic of the transmission of culture, a grown man on one side holding out his torch to a young man, that he may light his torch by it. The most important picture at the Jena University is the Auszug deutscher Studenten im Jahre 1815 by Hodler, who used as a model for the middle figure the youngest son of Professor Eucken.

Auditorium No. 1, the largest classroom of the new building, is assigned to Eucken, and we find it already about half filled, altho it is not yet 7 o'clock in the morning. Some seventy students I count, and among them about a dozen women, not segregated, but scattered here and there, for Jena is coëducational now, and masculine resentment at the intrusion of women has quite died out. The students may seat themselves wherever they choose, affixing a card with name and hour if they want to hold a particular place. These cards and even the desks are scrawled with automatic writing and sketches by the inattentive hands of students. The seats, long benches with a fixed desk and book rack in front, are better than those found in English universities, but not so good as the American individual seats. There are plenty of windows along one side of the room, and the walls—white above, light green below—diffuse the rays agreeably. The floor slants down to a plain pine desk and a small blackboard. On the wall is a mosaic portrait of the late Professor Abbé, the real patron of the University, for a prosperous optician is of much more use to a modern university than a needy Gross-Herzog.

Promptly on the hour a vigorous shuffling and stamping of feet announces the arrival of the professor, who begins with *"Mein' Herren und Damen"* as his first foot steps upon the platform. A German professor always gives good measure, a full hourful, prest down, shaken together and running over; no period of preliminary meditation on what he shall say and of casual conversation at the end, as often in America. Nor do the German professors find it necessary to adopt the low voice, indifferent air and hesitating utterance regarded at Oxford and Harvard as the mark of the gentleman and the scholar. In fact I find, in roaming about our universities, that so many of our younger men have adopted this pitch and tempo, being often inaudible and never impressive to the back seats, that I am tempted to lay down the law that the younger the instructor the poorer the voice. When I complain of it they reply coldly: "One can never shout and tell the truth." But Eucken is evidently not afraid

that being heard will impair his veracity. You might take him for a revivalist. You would not be wrong if you did. His voice rings out loud and clear. He is tremendously in earnest. Occasionally, when he thinks of it, he sits down. But not for long. He springs to his feet and throws himself forward on the reading-desk in the effort to really reach his audience. He clasps his hands to his breast and then throws his arms out wide, as tho to seize the *Geistesleben* with which his heart is overflowing and spread it far over a materialistic and indifferent generation. Who can doubt the reality of "the spiritual life" after he has seen Eucken? It shines in his face. We do not need to be told that Activism is his philosophy. It shows in his movements. He lives his theories. Few philosophers do, luckily for most of them.

"Happiness" is the subject of this lecture. The spiritual life is the theme of it, as always. The spiritual life, he says, goes out from within and transforms the world, thus giving true happiness. We must work with the world movement if we would partake of its divine purpose. And here he quotes Plotinus, the first religious philosopher, for whom he has as high regard as have Maeterlinck and Bergson. We must utilize the force of faith; must bring this Christian power into modern life. True ability is moral ability. Labor is not merely activity; it has a purpose; it is directed against opposition. By strife and striving we must reach the reality of the spiritual life. Thru labor and love we attain our true selves.

THE NEW BUILDINGS OF THE UNIVERSITY OF JENA

The fulfilling of duty is inner freedom. The unrest and stress of the present day are the signs of a new spiritual birth. The function of philosophy is not to afford intellectual or esthetic gratification, but it is to deepen and enrich life. To the fine old German saying, "A man is more than his work," Eucken added "Mankind is more than his culture." It is a *Lebensanschauung* rather than a *Weltanschauung* that he teaches, for to him a theory of life is more important than a theory of the cosmos.

These are merely a few fragmentary thoughts that I gathered in that memorable hour. Of no value in themselves, I give them merely to prove that I got something out of the lec-

ture, for I never understood spoken German until I heard Eucken. But even a deaf man would have found it profitable to be there. A second lecture followed immediately, on "Pessimism and Optimism," delivered with the same vigor and listened to with the same interest. Professor Eucken is now sixty-seven years old, and would be Carnegied if he were in an American university, instead of giving lectures from 7 to 9. His hair and beard are pure white, but set off handsomely his pink cheeks and his bright blue eyes still unspectacled.

And when he leaves the lecture room he does not leave his work, but goes to more of it at home. On one wall of his study is a photograph of Michael Angelo's "Creation," from the Sistine Chapel, and on the opposite a cast of a section of the Parthenon frieze. Between these is the desk of the man who has brought together the highest aspirations of Greek and Christian culture; a table stacked high with papers and manuscripts.

His correspondence is now voluminous, but he answers all letters promptly and carefully, writing his replies in the old fashioned way, with a pen. He receives all visitors and will talk of his philosophy to a single auditor with the same unwearied enthusiasm as to an audience. Even those who are repelled by the severity of his literary style are attracted by the charm of his personality, and this accounts in large part for his devoted following in all parts of the world.

After granting me an interview which took the heart out of his afternoon, Professor Eucken returned good for evil by inviting me to dinner in the evening, when I found that the lady on my right was from Nebraska and the one on my left from Switzerland, while around the table I saw a young Boer from the Transvaal, a don from Oxford, a professor from Tokyo, and representatives of I don't know how many other nationalities.

The extension of the influence of Professor Eucken thru this hearty hospitality is due largely to his wife. Frau Eucken, has happily not confined herself to the duties which the Kaiser prescribes as woman's only sphere, *Kirche, Kueche und Kinder.** She is not only wife, mother and housekeeper, but artist and musician as well. Her success in managing what might be called an international salon of philosophy is facilitated by her ability to converse in many languages. On account of the generous hospitality extended to students and strangers by the Eucken household a removal was made last year to a new villa in the suburbs. Professor Eucken's wife and daughter are with him now in America.

Eucken's philosophy of life is dramatic. His life has been undramatic; the even, ordered course of the typical German professor, made even more uneventful by reason of his mastery of the gentle art of not making enemies. Born in Aurich, East Friesland, January 5, 1846, he studied at Göttingen under Lotze, and at Berlin under Trendelenburg; taught for four years in a *gymnasium;* then for three years in the University of Basel; in 1874 was called to the University of Jena, where he has ever since remained, in spite of calls to larger institutions. His inner life has been as uneventful as its external aspects; continuous, methodical, logical development of thought, without leaps or backslidings.

First, in 1878, he laid the foundations in the study of the concepts of philosophy which attracted the attention of President Porter. Seven years later he was ready to outline his own guiding theory in a volume bearing the characteristically Germanic title of "A Prologomena for the Investigation of the Unity of the Spiritual Life in the Consciousness and Acts of Mankind." From this standpoint of the unique significance of the spiritual life he then reviewed the whole history of the evolution of philosophy from Plato to Nietzsche. His purpose in this work, known in English as "The Problem of Human Life," was as he explains, "to afford historical confirmation of the view that conceptions are determined by

*These must, I suppose, be translated into English as "kirk, kitchen and kids."

life, not life by conceptions," and "that human destinies are not decided by mere opinions and whims, either of individuals or of masses of individuals, but rather that they are ruled by spiritual necessities with a spiritual aim and purport, and that for man a new world dawns, transcending the merely natural domain—the world, namely, of the spiritual life.

The sentences quoted are alone enough to show that Eucken's "history of philosophy" is a very different thing from what usually goes by that name, that is the chronicling of the speculations of successive generations of metaphysicians, each one wiping clean the slate before he began to write. Eucken sees an aim and purpose in philosophic thought. He does not regard it as a mere amusement or as an intellectual exercise, but rather as a method by which humanity may grow into a higher sphere of existence. The vital need of the day, then, is to awaken the present indifferent and busy generation to a realization of the supreme importance of spiritual things and to the necessity of bringing the Christian religion into vital connection with modern thought.

This is the task to which Eucken devoted his energies when by the close of the nineteenth century he had fully matured his views, and the rapid succession of volumes which have since come from his pen are concerned with the moral and intellectual difficulties which nowadays impede religious progress.

The development of natural science and especially the theory of evolution have led to the identification of man with nature. Yet the very fact that we have come to know that we belong to nature shows that we are more than nature.

A transcendence of nature is already accomplisht in the process of thought. A consideration of all the facts leads us to the result that a life consisting solely of nature and intelligence involves an intolerable inconsistency; form and content are sharply separated from each other; thought is strong enough to disturb the sense of satisfaction with nature, but is too weak to construct a new world in opposition to it. Life is in a state of painful uncertainty and man is a Prometheus bound in that he must experience all the constraint and meaninglessness of the life of nature, and must suffer therefrom an increasing pain without being able to change this state in any way.*

From time to time in the course of history, spiritual impulses arise which are fundamentally different from physical self-preservation. "They force human activity into particular channels; they speak to us with a tone of command and require absolute obedience. Neither the interests of individuals nor those of whole classes prevail against them; every consideration of utility vanishes before their inner necessity." Religious movements show life in a particular form; something emerges in it which, unconcerned with the weal and the wo of man, follows its own course and makes absolute demands. Man is not altogether the creature of his environment, nor are his moral standards determined by society. The individual is able in the light of his own conscience to approve and value something which all around him reject; and conversely to condemn and reject something which all around him esteem and respect. This opposition of individuals to the condition of things in the social environment has been the main source of all inner progress in matters of morality.

This line of thought leads Eucken to the conclusion that a new life distinct from that of nature arises in our soul. The spiritual life is not the product of a gradual development from the life of nature, but has an independent origin and evolves new powers and standards. We must recognize in the spiritual life a universal life which transcends man, is shared by him and raises him to itself. The philosophical treatment of history ought first of all to trace the liberation of life from the mere human; the inner elevation of our being to a more than human.

In discussing the question of how man attains the spiritual life, Eucken steers carefully between the position of Buddhism, that each man must

*Life's Basis and Life's Ideal, p. 118.

work out his own salvation without any aid from above, and the extreme Calvinistic position, that man is purely passive and altogether undeserving. Or to quote his own words:

It is necessary to acknowledge that in all the spiritual movement which appears in the domain of man, there is a revelation of the spiritual world; as merely human power cannot lead the whole to new hights, in all development of the spiritual life the communication of the new world must precede the activity of man. At the same time where we are concerned with a life that is independent, and of which the activity is conscious and self-determined, the change cannot possibly merely *happen* to man; it must be taken up by his own activity; it needs his own decision and acceptance.

Only thru ceaseless activity can life remain at the hight to which it has attained.

This leads to the distinctive form of Eucken's philosophy of life, known as Activism. This is like Pragmatism in its rejection of the mere intellectualistic view of life and in basing truth upon a more spontaneous and essential activity. But Eucken's objection to Pragmatism is stated in the following language:

Pragmatism, which has recently made so much headway among English-speaking peoples and beyond them, is more inclined to shape the world and life in accordance with human conditions and needs than to invest spiritual activity with an independence in relation to these, and apply its standards to the testing and sifting of the whole content of human life.

FRAU EUCKEN IN THE DINING ROOM OF VILLA EUCKEN

At its highest, religion has always been concerned with winning a new world and a new humanity, not with the achievement of something within the old world and for the old humanity.

It will be seen that Eucken does not fall in with the tendency of the times to subordinate the individual to society. The spiritual life springs up, not in the "social consciousness," but in the soul of the individual, elevating his spiritual nature above all environment. But such a person is guarded against the arrogance of a superman by realizing that this superiority is

PROFESSOR EUCKEN ENTERTAINING A FRIEND IN THE GARDEN OF HIS VILLA

not due to personal merit, but solely to the presence of the spiritual world.

This, as Eucken recognizes, may be called a form of mysticism, but it differs decidedly from the older mysticism in some important respects. It is not Quietism, but its opposite, Activism. Eucken does not regard the individual as seeking a peaceful haven by absorption into the infinite; on the contrary, the infinite enters the individual and rouses him to intensest and creative activity.

Here Eucken shows a striking similarity to Bergson. The *Geistesleben* might be regarded as a higher development or manifestation of the *élan vital.* Both involve the conception of an upward impulse acting at individual points which thus become centers of spontaneous vital activity. It is curious that this view, so characteristically modern and as novel as anything can be in the realm of metaphysical speculation, should have simultaneously and independently been made a fundamental doctrine by two philosophers so unlike in temperament and training, the French philosopher starting from the standpoint of mathematical physics and Spencerian evolution, and the German from academic metaphysics and Christian theology. Such a coincidence, as well as the reception which the teachings of Bergson and Eucken have received in many lands, show that their common principle is in harmony with the spirit of the age. Eucken and Bergson met for the first time at Columbia University last week.

It might be feared that Eucken, emphasizing as he does the individualistic origin of religious inspiration and realizing as he does the injury done to the Christian cause by clinging to antiquated formulas and medieval conceptions, would be inclined to undervalue ecclesiastical institutions and to advocate too violent a break with historic Christianity. But here again his moderation and sanity are manifest. He cannot be called orthodox from the standpoint of the establisht Lutheran Church. He agrees entirely with his colleague Haeckel in condemning the union of Church and State, but for opposite reasons; Haeckel because the Church receives thereby artificial support; Eucken because the Church is thereby hampered in its freedom of development.

He never, however, falls into the error of thinking that a "new" religion can be made to order to suit the times, or even the needs of any one person. He finds in historic Christianity all the essentials of a permanent and universal religion, capable, when properly understood and presented, of satisfying the severe requirements of modern thought and feeling. But this is not to be accomplisht by merely eliminating whatever the modern mind finds objectionable.

> A religion is not primarily a mere theory concerning things human and divine—such a theory can, of course, be quite easily put together with a little ingenuity—it discloses ultimate revelations of the spiritual life, further developments of reality, great organizations of living energy, movements, in a word, which have convulsed the age in which they came victoriously to birth, and have subsequently proved themselves strong enough to attract large portions of mankind, weld each of these inwardly together, and set an invisible world before it as the main basis of life. In such upheavals of the life of the people there is opened a rich mine of fact which becomes the property of all men, and includes valuable experiences of humanity as a whole. He who would cut himself off from this great stream of experience, inward as well as outward, will soon find out how little the isolated individual can do in matters of this kind. It is easy to find fault with what tradition hands down, no less easy to draw up vague views of one's own, but how immense is the distance which separates procedure such as this from the creative effort which urges its sure way forward, from the synthesis which embraces all men's lives and exercises an elemental compulsion upon them.*

Eucken's clairvoyant faith sees thru the present anti-religious atmosphere the dawning of a new era in which the spiritual life shall again be dominant. Yet no one has recognized more clearly the alienation of

**Christianity and the New Idealism,* p. 146.

the Church from the cultural and the practical life of the day. This chasm is no doubt greater in Germany, where the Catholic and Protestant churches are state institutions and identified with reactionary elements, than it is in our own country, where there is fortunately no Church, but many churches, all equally free to adapt themselves to changing conditions and to prove themselves useful to society in their own way. But it must be admitted that our churches are not availing themselves of this exceptional freedom and do not show the originality and diversity which is characteristic of life and growth.

Eucken is conciliatory, but no compromiser. He does not solicit for religion a humble place in modern life by using arguments like those employed in the sale of "patent medicines," that it is innocuous at the least and may somehow do some good. He meets modern science upon her own ground. He claims for religion an equal practicality and efficiency; he demands for it a greater certitude and he is willing, as Jesus was willing, to put it to the pragmatic test.

Since we have found that religion is linked thus closely with the whole, we need not make any timid compromise with certain superficial contemporary movements and content ourselves with a lower degree of certainty, saying, for instance, that we can never altogether eliminate the subjective element, and that religious truths can never have the certainty of such formulæ as 2x2=4. On the contrary, we maintain that it is a very poor conception of religion which deems any certainty superior to hers, and does not claim for her truth a far more primary certainty than that of the formula 2x2=4. Only a shallow and perverse conception of truth can allow the certainty of the part to exceed the certainty of the whole.*

Either religion is merely a product of human wishes and ideas under the sanction of tradition and social convention—and then neither art nor might nor cunning can prevent so frail a fabrication from being whelmed by the advancing spiritual tide—or else religion is based on facts of a supra-human order, and in that case the most violent onslaught cannot shake her; rather will it help her in the end, thru all the stress and toil of human circumstance, to discover where her true strength lies, and to express in purer ways the eternal truth that is in her.†

Christianity and the New Idealism, p. 28.

HOW TO READ EUCKEN.

Eucken is not a man of one book. He has put forth his ideas in many different forms; large volumes and little, works, historical, expository, argumentative, theoretical and practical, but his point of view has remained thruout his long productive career essentially unchanged, and is so clearly indicated in all his works that one may be sure of obtaining the fundamental principles of his philosophy from whatever volume he selects. If, however, I am expected to prescribe a particular book as an introduction to Eucken, I should say that the general reader who is interested in the relation of philosophy to religion—and one who is not interested in that would not care to read Eucken anyway—would find *Christianity and the New Idealism* (translated by Lucy Judge Gibson and W. R. Boyce Gibson. Harper, 75 cents) most suitable for the purpose. It is a small volume, as easy reading as anything of Eucken's, and discusses frankly the present crisis in religious thought and indicates what he believes the churches ought to discard and what they must maintain of their inherited doctrines and forms. *The Truth of Religion* (translated by W. Tudor Jones. Putnam, $3.50) covers similar ground, but in a more thoro and theoretical manner.

The volumes entitled in their English version *The Meaning and Value of Life* (Gibson translation. Macmillan, $1.25); *The Life of the Spirit* (translated by F. L. Pogson. Putnam, $1.50), are intended for the non-philosophical reader; while *Life's Basis and Life's Ideals* (translated by Alban G. Widgery. Macmillan, $2.50); *Main Currents of Modern Thought: A Study of the Spiritual and Intellectual Movements of the Present Day* (translated by Meyrick Booth. Scribner, $4); and *The Contest for the Spiritual Life* (Putnam, $3.50) are of a more technical character.

The Problem of Human Life as Viewed by Great Thinkers from Plato to the Present Time (translated by Williston S. Hough and W. R. Boyce Gibson. Scribner, $2) differs decidedly from the ordinary history of philosophy in that the author is not trying to set at odds and overthrow the successive philosophers, but is seeking for whatever in them is good and permanent, finally coming to "see them linked together as workers in one common task: the task of building up a spiritual world within the realm of human life, of proving our existence to be both spiritual and natural."

Single lectures and articles by Eucken readily accessible in English are: *Religion and Life* (Putnam, 50 cents); *Back to Religion* (Pilgrim Press, 35 cents); *Can We Still Be Christians?* (Macmillan); *Naturalism or Idealism* (the Nobel Lecture).

The titles of Eucken's chief works in German and in the English versions are as follows: *Die Grundbegriffe der Gegenwart* (The Main Currents of Modern Thought), 1878; *Die Einheit des Geisteslebens in Bewusstsein und Tat der Menschheit*, 1888; *Die Lebensanschauungen der Grossen Denker* (The Problem of Human Life), 1890; *Der Kampf um einen geistigen Lebensinhalt*, 1896; *Der Wahrheitsgehalt der Religion* (The Truth of Religion), 1901; *Grundlinien einer neuen Lebensanschauung* (Life's Basis and Life's Ideal), 1907;

†*The Truth of Religion.*

Hauptprobleme der Religionsphilosophie der Gegenwart (Christianity and the New Idealism), 1907; *Sinn und Wert des Lebens* (The Meaning and Value of Life), 1905; *Einführung in eine Philosophie des Geisteslebens* (The Life of the Spirit), 1908; *Erkennen und Leben* (Knowledge and Life), 1912, will soon appear in English translation.

Of the numerous books and articles about Eucken which have appeared in Europe, it will be sufficient to mention: *Rudolf Eucken. Die Erneuerer des deutschen Idealismus,* by Theodor Kappstein (Berlin-Schöneberg. Bucherlag der "Hilfe." M. 1.50); *Rudolf Eucken's Werk, Eine neue idealistische Lösung des Lebensproblems,* by Kurt Kesseler (Bunzlau: Kreuschmer, 1911); *Eucken's dramatische Lebensphilosophie,* by Otto Braun (*Ztsch. f. Philos. und Phil. Kritik,* 1909); *Rudolf Eucken's Christenthum,* by Ludwig von Gerdtell (Verlag von Becker).

La philosophie de M. Rudolph Eucken, by Emile Boutroux (*Acad. d. Sci. mos. et pol.,* 1910).

It is unnecessary to give a list of articles about Eucken in American magazines because any library that contains the files will have a periodical index, but a few references may be given: "Religious Philosophy of Eucken," *Harvard Theological Review,* vol. 2, p. 465 (1909); "Eucken and St. Paul," by Richard Roberts, *Contemporary Review,* vol. 97, p. 71; "Religious Philosophy of Eucken," by Baron F. von Hügel, *Hibbert Journal,* vol. 10, p. 660; "Eucken's Philosophy of Life," by W. Fite, *The Nation,* vol. 95, p. 29; "Eucken's New Gospel of Activism," *Current Literature,* vol. 53, p. 67; "Idealism of Rudolf Eucken," by S. H. Mellone, *International Journal of Ethics,* vol. 21, p. 15.

There are two excellent expositions of Eucken's philosophy in English, by his students and translators: *Rudolf Eucken's Philosophy of Life,* by W. R. Boyce Gibson (Macmillan, $1.40), and *An Interpretation of Rudolf Eucken's Philosophy,* by W. Tudor Jones (Putnam). The latter has the advantage of being the latest, and it was publisht last fall. A briefer compendium, *Eucken: A Philosophy of Life,* by A. J. Jones, has recently appeared in a series of handy volumes known as "The People's Books" (New York: Dodge Pub. Co. 20 cents).

Former articles of this series of "Twelve Major Prophets of Today" have appeared in THE INDEPENDENT, as follows: Maurice Maeterlinck, May 4, 1911; Henri Bergson, June 8, 1911; Henri Poincaré, October 5, 1911; Elie Metchnikoff, December 7, 1911; Wilhelm Ostwald, May 2, 1912; Ernst Haeckel, August 22, 1912.

New York City.

At Virtue's Booth

By Willard A. Wattles

Ye have read of the fabled city where Folly cries her ware,
The bartering crimson goddess who laughs thru Vanity Fair,
And dread, they say, is the danger that lurks in her shining hair.

And they say, the goodly people who pass on the other side,
That the scarlet robes of Folly and the pomp of her purple pride
Are damp with a nameless vintage that the strength of men has dyed.

It may be well for the goodly who seek the sheltered fold,
And better it were that no man filled a crimson lap with gold;
But what of the price at another fair where other toys are sold?

I have not bartered in Vanity Fair, and yet at Virtue's booth
I pay a bitterer price than that for an emptier gaud, forsooth,
When I fling on the pitiless counter there the lonely coin of youth.

There are days of toil, there are nights when sleep and the graciousness of rest
Sit wide-eyed on the pillow where my burning cheek has prest,
And I lie with empty arms awake who might sleep on Folly's breast.

I would not buy in Vanity Fair for all of her crimson cheat;
Yet I am not of the goodly throng who pass on perfect feet,
For I know that Folly's face is fair and I know that her voice is sweet.

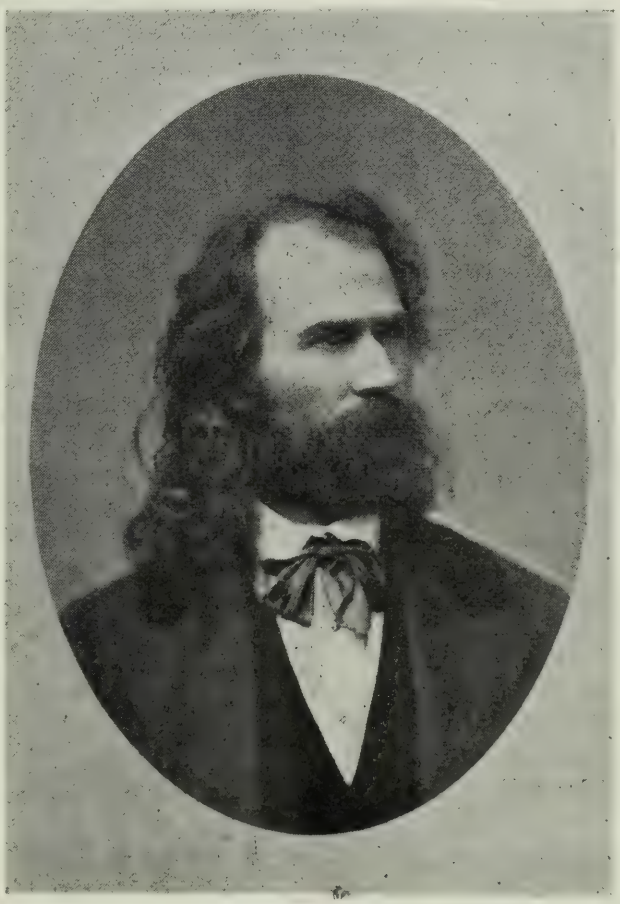
Amherst, Mass.

What is Poetry?

By Joaquin Miller

[An editorial in this issue is devoted to our late contributor. From the scores of articles contributed by Joaquin Miller to our pages we have chosen parts of two essays entitled as above. The best idea of the poet will be gained by a reading of his own work, but next to this nothing is more essential than the theory upon which he worked and by which he tested the poetry of other writers. The articles which form the basis of this contribution were publisht in THE INDEPENDENT for June 12 and June 19, 1879.——EDITOR.]

I do not undertake to say who is a poet or who is not a poet. I have neither the capacity nor the audacity for this. You have a thousand teachers and interpreters of the books of men abler than I.



I will go further back, and look not into the books of men, but into the book of Nature, of which all the books of men are at best only feeble interpretations.

"Heard melodies are sweet, but unheard melodies are sweeter." Written poems are delicious, but unwritten poems are divine.

I speak not about the art of poetry, but the inspiration of poetry.

The art of poetry is found in books; the inspiration of poetry is found only in Nature.

This book, the book of Nature, I studied in the wilderness like a monk for many years. And yet I do not despise the books of man. All religions, said the great Chinese philosopher, are good. The only difference is some religions are better than others, and the apparent merit of each depends largely upon a man's capacity for understanding it. This is true of poetry.

JOAQUIN MILLER IN HIS PRIME

All poetry is good, written or unwritten. I never read a poem in my life that did not have some merit and teach some sweet lesson.

To me a poem must be a picture; and it must be a picture if a good poem, so simple that I can understand it at a glance, and see it and remember it, as I would see and remember a good sunset.

I also demand that it shall be lofty in sentiment and sublime in expression. The only rule I have for measuring the merits of a written poem is by the hold that it takes on my mind and memory. I do not want to remember the words, but I do demand that it remain with me a picture and become a part of my existence. Take, for example, this familiar verse from Mr. Longfellow:

And the night shall be filled with music,
And the cares that infest the day
Shall fold up their tents like the Arabs,
And silently steal away.

There is a picture that will depart from no impressible clay.

The poem of *Evangeline* is a succession of pictures. I never read *Evangeline* but once—it is a waste of

time to look twice at a sunset; but I believe I can see every picture in that poem as distinctly as if I had been the unhappy Acadian, for here the author has called in all the elements that go to make up a perfect poem. When the great epic of this new solid Saxon tongue comes to be written it will embrace all that this poem embraces. New and unnamed lands; ships on the sea; the still deep waters hidden away in a deep and voiceless continent; the fresh and fragrant wilderness; the curling smoke of the camp-fire; action, movement, journeys; the presence, the inspiring presence of woman; the ennobling sentiment of love, devotion, and devotion to the death; faith and hope and charity; and all in the open air, under the bent arch of heaven.

For no great poem has ever been or ever will be confined in a parlor; or even fashioned from a city. There it not room for it there. You might as well try to grow a California pine in the shell of a peanut. Homer's *Odyssey,* out of which have grown books enough to cover the earth, owes its immortality to all this and its outdoor exercise. When this land is once more a wilderness and our language has perished from the earth, so far as I can guess, there is no living Saxon poet will endure the consuming fire of translation, like the old Greeks, except perhaps Walt Whitman. He cannot be made more rugged or more rough than he is, and there is for him a large probability of polish in translation.

I was once riding alone over the mountains of Durango, in North Mexico, when I was overtaken by what I thought to be a band of robbers. There was no escaping them—there was but this one mountain road climbing up the back of the great, steep, rugged mountain; and so I did the best I could—joined them and fell into conversation with the leader, half expecting all the time to be murdered.

At last, as we climbed the lofty summit and looked down over the rich valley, with its cool waters winding thru it, this black, hard-looking Mexican reined his mule, lifted his hat, and, looking over the valley, exclaimed: *Que hermosa!* "How beautiful!" I felt no fear after that. We slept together that night; and he told me, this man who could not read, many pretty things for my book.

To these poets; these lovers of the beautiful; these silent thinkers; these mighty mountaineers, far away from the rush and the roar of commerce; these men who have room and strength and the divine audacity to think and act for themselves — to these men, who dare to have a heart and enthusiasm, who love the beautiful world that the Creator made for them, I look for the leaven of our loaf.

Would you like to know the secret of happiness—a secret that no navigator ever brought from the sea; a a secret that no merchant prince was ever rich enough to purchase? I will tell you. The secret of happiness is the appreciation of the beautiful in Nature; the appreciation of God's unwritten poetry. Ah! you are disappointed. You expected me to tell you how to make a fortune, how to be famous. Do not be mistaken. The secret of happiness is the love of the beautiful; the secret of happiness is the appreciation of unwritten poetry.

I would say: Learn to read the book of Nature every day around you—all is open before you; and then the books of men will be simple things. The greater includes the less.

Love and comprehend beauty; for then you will love and comprehend the world.

Old Masters in America

The Loan Collection of Mr. J. Pierpont Morgan's Paintings at the Metropolitan Museum, New York

By David C. Preyer

Gems of the first water, the jewels of the European schools of art, are the paintings now on view at the Metropolitan Museum, loaned by Mr. J. Pierpont Morgan, its president. The thirty paintings displayed are a selection from the treasures, estimated to exceed fifty million dollars in value, which have recently been loaned by Mr. Morgan to the museum, but which are still in storage. The fine, square gallery where they are arranged becomes a temple of the ideal and of beauty, that beauty which pleases the senses and appeals to the intellect, which is the highest mission of art. There is here perfect symmetry, unity of spirit, exquisite harmony of form and color, only here and there rising to pomp

HOPPNER'S "SETTING SUN"

A fine example of English eighteenth century art—pleasing if posturing. This portrait of the Godsal children was exhibited at the Royal Academy in 1789 and is an admirable example of a painter scarcely less markedly British than Romney himself.

and splendor, but all giving blissful repose, kindling the admiration for art which idealizes nature.

The great Raphael altarpiece allures us first. Its divine purity of expression, the subdued wealth of its colors silvered by the light beyond, the glorious beauty of the Madonna and saintly women, offset by the earnest dignity of the Apostles, and then the ineffable charm of the two infants, make this early work one of Raphael's masterpieces. He was but twenty-two and had not yet acquired the greater floridity of style which came later. It is an example of Raphael's most careful work, exquisite in finish and delicacy of modeling.

This panel was painted in 1505 for the nuns of St. Anthony of Padua, in Perugia, in whose convent it adorned the altar for almost two centuries. But the good nuns became poor and had to sell their treasured painting, in 1677, to pay their debts. Thus it came into possession of the noble Roman house of Colonna, for which it is usually called the Colonna Raphael. They retained it for another century, when it was sold to the King of the Two Sicilies at Naples; and after the death of Francis II. it was sold, in 1896, in London, and a few years later it came into Mr. Morgan's possession.

When we stand before such a superb work of art we are most powerfully imprest with its beauty and magnificence—but we can't help, at least in this case, to let the gross thoughts of its material value creep in. For the fact is that this painting before us is the most valuable single work of art in America. When we consider that thirty years ago the British National Gallery bought the Ansidei Madonna from the Duke of Marlborough for $350,000—a work painted about the same period, but not as fine as ours—then half a million dollars is a fair estimate to make—which, however, is quite unnecessary, for it is really not for sale.

A PASTEL BY LA TOUR

Apart from its interest as one of his best productions, this portrait of Mme. de Mondonville has a history. Painted in 1753, it was exposed that year in the Salon of the Louvre. Several years earlier, the artist had executed a portrait of M. de Mondonville, one of his best friends. The wife of this friend, in suggesting that he undertake her own portrait, added that she could pay only 25 louis for it. La Tour went to work, but when the charming portrait had been finished, and its subject sent him the money at the bottom of a box of sweetmeats, he returned it. Thereupon Mme. de Mondonville sent him a silver dish, of a kind which she had observed to be lacking in his table service, and 30 louis in value. The dish, too, was returned, with word that La Tour valued his work at 1200 livres. This spirit is in striking contrast with that of Chardin, a contemporary, whose pastels are not equal to La Tour's in quality, but whose oil paintings command a far higher appreciation—and price, too. Chardin let admiring friends have his productions at any price at all, or even in exchange for a waistcoat which he happened to covet.

Another Italian painting here is by Fra Filippo Lippi, who painted a half century before Raphael. This arrangement of Saints with Donors has not yet developed to a harmonious, cohesive composition; still Filippo was the first who had direct recourse to the individual as a substitute for the ideal. He it was who brought the human type into art, in exchange for that ideal but conventional type of his immediate predecessors, Fra Angelico and Masaccio.

RAPHAEL'S "MADONNA OF SAINT ANTHONY"

This painting is known also as the Ripalda or Colonna Raphael, and is described by the English press as "probably the first great work of this master to cross the Atlantic." It dates from 1504-5.

Among the seven or eight Dutch and Flemish paintings I single out a masterful work by Meindert Hobbema, so characteristic of the landscape art of the Low Lands. It is a transcript of the peaceful beauty of nature given by a simple, serious and strong man. The warm green of the trees, the tintling, golden sun rays playing around the trunks, the glimpse of far-off meadows, and the typical Dutch sky, full of clouds and still brilliant with light, it all gives us the atmosphere of out of doors—we sense the smell of the earth, and our hearts expand as we gaze into the immense vault that arches over forest and field.

There are also five portraits. The famous "Nicolas Ruts," by Rembrandt, glows in rich yet sober color. The portrait of "Cardinal Ferdinand," by Rubens is most characteristic of the artist in the debonair grace of the pose and the courtier's smile on his lips. The two examples by Van Dyck are in his best manner before his excessive facility and his desire to please the Court at Whitehall made him lose the little sincerity he ever possest.

A Spanish jewel is found in the "Infanta," by Velasquez, with its elaborate toilet in the tiny pomp of royal childhood.

None of the French names is of a very great painter, and yet two of the examples here are exceptional in merit. Greuze never painted with a nearer approach to sincerity than when his subject was a charming little maid watching her kitten: "La Devideuse." True, his work is weakened by excess of sentiment and a leaning to prettiness. The portrait of Madame de Pompadour is an unusual performance of Carl van Loo, who generally must be regarded as an uninspired, tho skilful, painter of the artificial period of Louis XV. Here we find, with all the delicate frippery of rustic custume and floral basket, no demand of taste sacrificed; and its decorative quality is well kept within the bounds of moderation, sobriety and harmony.

GREUZE'S "SEWING GIRL"

"Be piquant if you can't be true," counseled this painter,—and lived up to the advice. Greuze is a Frenchman who had read his eighteenth century contemporaries: the Abbé Prevost's novels and translations from Richardson; Diderot's bourgeois tales and tearful comedies; Rousseau's enervating rhetoric and sentimentalized sensuality. Yet his artfully contrived naïveté is not without its charm; and his young girls are the admiration of every undiscriminating art-lover.

The English school is most numerously represented, and with one or two exceptions by portraiture. The powerful "Scene on the River Stour," by Constable, is noteworthy.

That attractive family group, "Lady Betty Delmé and Her Children," bespeaks the reason why Ruskin spoke of Reynolds as the "lily sceptered," for to all the force, and dignity, and life, and naturalness of these portaits there is added that most particular distinction: the crown of grace. We never find in his work the veneer of conventional elegance, but this was his supreme gift—to present his people with characteristic charm and simplicity, always suggestive of mental and moral refinement.

There are magnificent portraits by Gainsborough, by Romney, Raeburn, and Hoppner. One of the most attractive of all is the "Miss Farren," by Sir Thomas Lawrence, in its most natural and unaffected pose, with the finest landscape background Lawrence ever painted. As a critic of the time observed: "It is completely Elizabeth Farren—arch, careless, spirited, elegant, and engaging." One day she came into the studio for a sitting, and was about to remove her cloak, when the artist was so struck with her attitude that he begged her to remain as she was, and he so painted her, without sketches or studies—and he was twenty-one and never surpast this effort.

This wonderful array of masterpieces gives an exciting foretaste of what is to come when all the treasures of the Morgan loan shall be exposed.

New York City.

The Korean Conspiracy Case

By Albertus Pieters

[The writer of this article is a missionary in Japan of the Reformed (Dutch) Church in America. He is one of the strongest and most experienced missionaries there; and because of his familiarity with the Japanese language he was chosen to attend the trial, which is conducted at Seoul in the Japanese language, with which the missionaries in Korea are not familiar. Mr. Pieters is very careful in this article to express no opinion as to the guilt or innocence of the accused, and to make no statements not brought out in the trial, as the case is now being tried on appeal by a superior court.—EDITOR.]

The trial before the Court of Appeals at Seoul, Korea, of 105 Koreans on the charge of having conspired to murder Gen. Terauchi, the Governor General, promises to be one of the great criminal cases of the twentieth century. It may be worth while to give a brief statement of the case at the stage now reacht, based not upon rumor or private information, but upon the solid ground of public proceedings.

That the reader may have a clear idea of what is going on, it will be necessary first to explain the method of judicial procedure, which differs in many respects from that of the United States. The first work on every criminal case is done, of course, by the secret service men, who are sure to be particularly abundant in a country situated as Korea now is. These lay their information before the police and the suspected men are arrested, without a warrant being issued, and without any information being given the men. Bail may be granted under the law, but it is rather common for the court to refuse bail, lest advantage should be taken of the opportunity to destroy evidences of guilt. The men arrested are questioned by the police much as with us; and if there appears sufficient reason to hold them they are sent to the Procurator's Court (*kenjitei,* where that officer, who corresponds to our prosecuting attorney, conducts a preliminary but secret trial, at which the accused is examined, but is not allowed counsel.

If the procurator is satisfied that there is a case against the prisoner, he draws up a brief, setting forth the facts as he believes them to be, and this statement forms the basis of the public trial. It will be seen that the proceedings at the *kenjitei* occupy a place in the order of events somewhat corresponding to our grand jury. The procedure leads to this important difference, that the general public, and possibly to some extent the court, is inclined to view the indictment prepared by the procurator rather as a verdict already reacht than as a question to be investigated.

The next step is the public trial, presided over by a judge and two associates, who render the verdict. There is no jury. The accused and the witnesses are examined by the pre-

siding judge. Neither the prosecutor nor the counsel for the defense—for here the accused is allowed counsel—take a very active part in the proceedings. Questions asked by them are in the nature of suggestions to the judge, who puts them to the witnesses.

After judgment is rendered by the Court of First Instance the case may go to the Court of Appeals, and, if important, still further to the Court of Cassation.

Criticism of the above method is obviously out of place in discussing this or any other particular case. The officers of the law are obliged to administer the law as they find it. The writer is not a lawyer, and does not speak with any special knowledge, but it is his impression, after more than twenty years' residence in Japan, that in ordinary cases the ends of justice are as well served by this procedure as by the methods of our own courts.

In the present case the activity of the detectives resulted in a large number of arrests. Some of those arrested were releast after the police examination. Others were banisht to the Island of Quelpart without public trial, by an exercise of extraordinary power vested in the police, under what is known as the Peace Preservation Regulations. Four died, two in prison and two shortly after release. Three became temporarily insane. The procurator held 123 for public trial.

This public trial began in the Court of First Instance, June 28, and judgment was delivered September 28, 1912. The indictment sets forth a mass of allegations which center about the theory that the New People's Society, originally establisht, possibly, for innocent purposes, had become by the summer of 1910 an organization having as its objects the establishment of a military academy at West Chientao, beyond the Tumen River, in Manchuria, the making of preparations for a war of independence, and the assassination of prominent Japanese officials. Baron Yun Chiho is supposed to have been the president and to have been fully cognizant of its treasonable and criminal purposes.

Baron Yun is a highly educated man. He studied at Vanderbilt University, under Bishop E. E. Hoss, of the Southern Methodist Church, and was for a time professor in the Anglo-Chinese College at Shanghai. He speaks English, Japanese, Chinese and French, besides his native tongue, and addrest the Edinburgh Conference, in the spring of 1910, in fluent and excellent English. He has held many important positions under the Korean Government, having been Vice-Minister of Education, and a member of the special Korean embassy at the coronation of the Czar of Russia. He is the foremost Korean Christian, is president of the Anglo-Korean school at Song Do, and is reputed to be a man of mild disposition.

Treasonable meetings were, says the indictment, held at Seoul, particularly on September 10, November 16, and December 3, 1910.

From these meetings men and messages were sent out to stir up the members of the society to assassinate the Governor-General. Three times did the conspirators expect the Governor to visit the northern provinces, and each time they were ready to kill him, but the information that he was coming proved false. Finally word came that he was certainly to come in the latter part of December, and that everything must be ready for the assassination. Messengers hurried hither and thither, meetings of the conspirators were held, money was collected, and the bands of murderers gathered to wait for their victim at six railway stations. The Governor escaped them all, in some cases because the train did not stop, in others because the assassins lacked courage at the critical moment, and often because the strict care of the police foiled the attempt. So determined, however, were the would-be murderers that they pursued the private car of the Governor-General to New Wiju, and lay in wait for him in the vicinity of

the car from 8:30 in the evening to 3 o'clock the next morning, but fortunately he spent the night in the car and they lacked opportunity to make the attack.

This attempt, in December, 1910, having completely failed, another was made and failed at the beginning of November, 1911, when General Terauchi went to New Wiju to attend the formal opening of the great steel bridge across the Yalu, completing Japan's trunk line connections with Europe.

The above is what we would call the indictment, which was laid before the Court of First Instance. The Court found seventeen of the accused not guilty, but convicted the remainder and sentenced them to various terms of penal servitude, ranging from five years to ten. The 106 who were convicted appealed, and we are now in the midst of the second public trial. One prisoner is out on sick leave and is not on trial.

The *Japan Chronicle* gave a careful and measurably full account of the proceedings in the first trial, and the impartial accuracy of this report, so far as we know, has not been challenger. The case as presented is marked by some peculiar features:

First, by the number and character of the accused. Of Baron Yun we have already spoken. Among the others were many Christian pastors, elders, teachers in Christian schools, and others distinguisht for quiet, peaceable and godly lives. Very few were from the military or adventurous section of the populace, none, if we remember correctly, from the so-called criminal classes. Some have no religion at all. Two are Roman Catholics. A few are Methodists. A majority are members of the Presbyterian Church of Korea.

The second remarkable feature is that more than 100 of these men, including Baron Yun, confest to the police that they were guilty as charged. Certainly this is very unusual. The crime with which they were charged was punishable with death, and for more than 100 men out of 123 to confess guilt of a capital offense is not an ordinary occurrence.

The third remarkable feature is that all, this time without exception, have withdrawn their confessions. Some did this before the Procurator's Court, all the rest did it before the Court of First Instance except one, and that solitary exception has done it before the Court of Appeals, saying he was crazy when he acknowledged his guilt.

The fourth remarkable feature is the fact that the confessions implicated many of the American missionaries. Seventeen or eighteen of these were mentioned by name in the procurator's brief as being accomplices, by such acts as taking charge of weapons, making speeches urging the assassination, reproaching the Koreans with cowardice, etc.

In the official verdict of the Court of First Instance the names of the missionaries are not mentioned, but in the exhibits attacht to the verdict and bound in the same volume with it they figure prominently. These exhibits are as much a part of the permanent record as is the verdict itself, and with the exception of the fact that the missionaries were not arrested and placed on trial there is nothing to indicate that the court regards the statements recorded against them as any less trustworthy than the other statements upon which the accused were convicted.

The fifth remarkable feature was the absence of witnesses in court. The testimony of certain witnesses who had been examined by the police or by the procurator was referred to, but these witnesses were not produced in court, altho counsel for the defense asked for them. Some documentary evidence for the defense was received. One witness only was called and examined in court, a railway official, who produced the record of passengers carried between certain stations on certain dates. The prosecution had alleged that bands of thirty men and upward had traveled by rail to various rendezvous on those dates, but the records showed an average of only six or seven passengers on all on those dates between

those stations. So far the prosecution certainly failed to establish its case. Whether the testimony of other witnesses would have been similar in trend must remain uncertain, for the court called no more witnesses.

It is not questioned that the court was acting within the limits of its authority in refusing to call any or all witnesses. Yet it was a most unusual exercise of this authority. The examination of witnesses ordinarily forms a part of the routine of court procedure in Japan as well as elsewhere.

This action of the court led to a most dramatic scene, which may be called the seventh remarkable feature of the trial. The counsel for the defense retired in a body, and after consultation returned to the court and anounced that the refusal of all witnesses for the defense obliged them to assume that the court was not an impartial tribunal. In order to uphold the dignity of the judiciary and to protect fully the rights of barristers and their clients, they felt that they had no alternative but to move the exclusion of the judges, in accordance with Article 41 of the Code of Criminal Procedure. This action caused an adjournment of a month, during which the motion was argued first in one court and then, on appeal, in another, but it was overruled and the original judges were ordered to proceed with the hearing of the case.

The eighth remarkable feature of the case is the one that has excited the keenest interest. It is the explanation given by the accused of the fact that they confest themselves guilty of crimes of which they now say they are innocent. Since there was practically no evidence apart from these confessions (the prosecution produced none whatever in court), and since the confessions are all repudiated, it becomes of the greatest interest to know how they came to be made. Baron Yun's explanation in the lower court, as reported in the *Japan Chronicle,* was not clear. He has since told the Court of Appeals that he was tricked, and that he really made no confession; that he did make certain statements in reply to certain questions of the examiner, but that he had no idea he was confessing to any plot for assassination, the questions being so framed that their real purport was hidden from him. All the rest of the accused who confest assert that the confessions were dictated by the police and that assent was wrung from them by unspeakable torture. Before the Court of First Instance this was plainly and frequently said, and some slight details were given; but the court immediately silenced all who attempted to describe the tortures employed, and very little was on record until the Court of Appeals took up the case. In the present trial, which began on November 26, we have listened to little else than vivid and harrowing tales of fearful sufferings. We have no desire to be sensational, but we do desire to be reasonably full, and give a list of the methods alleged by the prisoners in open court to have been employed by the police. They say they were hung up by the thumbs, stript, flogged until unconscious, starved, burnt with hot irons, scorched with charcoal fires, stript naked in mid-winter, with ice water poured over for hours at a time, pricked with knives, bound and left for hours in half stooping positions able neither to sit nor to stand, that their wrists were bound so tightly and left bound so long that pus issued from the swollen and suppurating parts, and other similar things, too numerous, too hideous, and too indecent to mention. The remarkable thing is that these things are said by men who up to the time of their arrest were noted for truthfulness and purity of speech and life, men who had for years measured up to the highest standards by which a man may hope to deserve to win the confidence and respect of his fellowmen.

This charge of torture was met in open court by an absolute official denial. Since this article is written upon the basis of publicly ascertained and settled facts, it would be out of place here to express an opinion upon this

question. Pending a thoro investigation by the proper authorities, one is obliged to balance the testimony on the one side against that on the other, and to judge for one's self whether the circumstances of the case can be better explained upon the one theory or the other. But this leads us to the last, and, in some respects, the most remarkable feature of the whole proceeding, and that is this: these charges of torture have not been investigated.

Seoul, Korea.

The Impossible War

By David Starr Jordan, M.D., Ph.D., LL.D.

[The remarkable fact that the Great Powers of Europe have refrained from hostilities during the Balkan war, the dilatory negotiations at London and the renewal of the war are the best of evidence that the "power behind the thrones"—*The Unseen Empire*, as President Jordan calls it in his recent book by that title—has decided that it will not pay to provoke a conflict altho it does obviously pay to make people believe that a war is imminent. If such a delicate and involved question as the disposition of European Turkey—the fruitful cause of wars in the past—can be settled by those immediately concerned without involving other nations, it is hard to believe that any difficulty is likely to arise in the future which may not be settled by peaceful methods. President Jordan has in recent years devoted much of his time to the peace movement, which as a biologist he considers primarily from the standpoint of eugenics. His latest contributions to THE INDEPENDENT on the subject are: November 14, 1912, "A Dream of Invasion"; July 6, 1911, "Concerning Sea Power," and December 21, 1905, "War and Peace Decadence."—EDITOR.]

What shall we say of the Great War of Europe, ever threatening, ever impending and which never comes? We shall say that it will never come. Humanly speaking, it is impossible.

Not in the physical sense, of course, for with weak, reckless and godless men nothing evil is impossible. It may be, of course, that some half-crazed archduke or some harassed minister of state will, half unknowing, give the signal for Europe's conflagration. In fact, the agreed signal has been given more than once within the last few months. The tinder is well dried and laid in such a way as to make the worst of this catastrophe. All Europe cherishes is ready for the burning. Yet Europe recoils and will recoil, even in the dread stress of spoil-division of the Balkan War.

Behind the sturdy forms of the Bulgarian farmers lurks the sinister figure of Russian intrigue. Russia and Austria, careless of their neighbors, careless of obligations, find in this their opportunity. And the nations of Europe in their degree are bound to one or the other of these malcontents. Neither Russia nor Austria can be trusted to keep the peace even in her own interest, for both, thru debt abroad and discontent at home, are in a condition of perpetual crisis.

But accident aside, the Triple Entente lined up against the Triple Alliance, we shall expect no war. Some glimpses of the reasons why appear daily in the press. We read that German and that Austrian banks try in vain to secure short loans in New York, even at 8 per cent. We learn that great bankers refuse absolutely to loan on any terms for war. We learn that on the day of Montenegro's declaration of war the nominal value of stocks and bonds in Europe fell to the extent of nearly 7,000,000,000. The loss of France alone, the creditor of Europe, is given at $800,000,000.

At the same time the house of Krupp, greatest builders of war tools, reports a surplus for the year of $12,500,000. A 12 per cent dividend was declared, besides the setting apart of $4,000,000 for welfare work and capital reserves.

The gains of war and war-talk go to the vultures. The cost falls on the people. Whatever else happens the common man stands to lose in war. In such a war as this they all lose mightily.

The number of men who might be

engaged in a general war are thus tabulated by Prof. Charles Richet, of the University of Paris:

	Men.
Austria	2,600,000
England	1,500,000
France	3,400,000
Germany	3,600,000
Italy	2,800,000
Rumania	300,000
Russia	7,000,000
	21,200,000

If these nations, supposed to be diplomatically concerned in the question of whether the obscure Albanian port of Durazzo should fall to Servia or to Austria, neither of the two having the slightest claim to it, should rush into the fight, the expense would run at $55,000,000 per day, a sum to be greatly increased with the sure rise of prices.

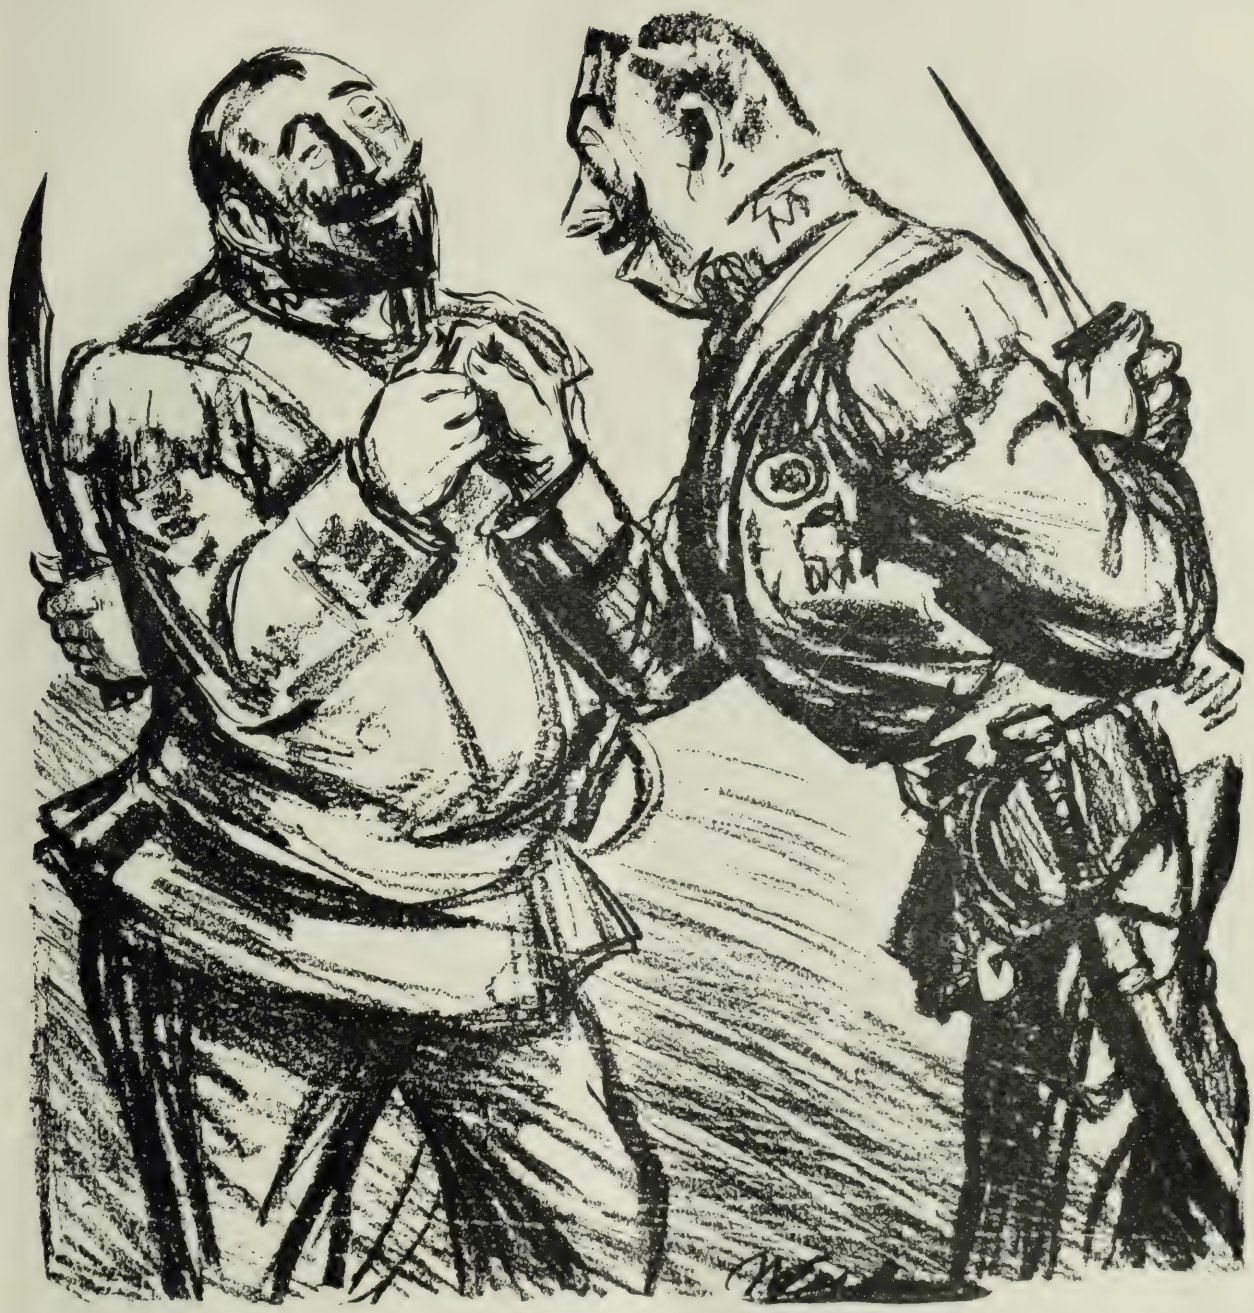
The table of Richet (here changed from francs to dollars) deserves most careful attention.

Daily cost of a great European war:

Feed of men	$12,600,000
Feed of horses	1,000,000
Pay (European rates)	4,250,000
Pay of workmen in arsenals and ports	1,000,000
Transportation (60 miles 10 days)	2,100,000
Transportation of provisions.	4,200,000
Munitions: Infantry, 10 cartridges a day	4,200,000
Artillery, 10 shots per day.	1,200,000
Marine, 2 shots per day	400,000
Equipment	4,200,000
Ambulances, 500,000 wounded or ill ($1 per day)	500,000
Cuirassés	500,000
Reduction of imports	5,000,000
Help to the poor (20c. per day to 1 in 10)	6,800,000
Destruction of towns	2,000,000
Total per day	$54,900,000

To all this we may add the horrors of the air, the cost of aëroplanes and of burning cities which this monstrous abomination of murder may render inhumanly possible. The nation which uses instruments like these against a sister nation can boast no advance over the Red Indian and his scalping knife.

In this connection we must remember that Europe still owes $27,000,000,000 for old war debts; that her present nominal capital of floating bonds is estimated at $150,000,000,000; that she has in circulation at present ten to twelve billion dollars of bank notes, and that in all her banks and vaults there exists but seven or eight billion dollars of actual coin or bullion, a third of this locked up or tied up in vaults from which it cannot escape. The total of coin money and bullion in circulation in the whole world is not far from $10,000,000,000.



The growth of credit in the last forty years has been without conceivable precedent. The movable credit of Europe in 1871 did not exceed $40,000,000,000.

The masters of credit are staggered at the hazards of present-day war. Wars of a certain class may be tolerated, others may be connived at in the interest of local exploitation, but the great wars—ending perhaps, whoever is victorious, in the total destruction of credit—present appalling risks unknown to any earlier generation.

The bankers will not find the money for such a fight, the industries of Europe will not maintain it, the statesmen cannot. So whatever the bluster or apparent provocation, it comes to the same thing at the end. There will be no general war until the masters direct the fighters to fight. The masters have much to gain, but vastly more to lose and their signal will not be given.

It is not alone the paralysis of debt which checks the rush of armies. The common man is having a word to say. While the waning aristocracy is everywhere for war, and while the man with nothing to lose repeats the echo, the good citizen sees the world in a new light. He is not so ready for a fool's errand to Durazzo as he was a couple of generations ago to enter Sebastopol. The cause of peace has moved forward in these years, and in the only way in which real progress in civilization can be made, the enlightenment of the people.

FIRST MEXICAN GENERAL:—"Ah, Excellency, what a privilege to sink our personal ambitions for our dear country!"

THE NEW BOOKS

Mr. Dreiser's Financier

It is the easiest thing in the world to point out Theodore Dreiser's shortcomings. His tedious convolutions, his circuitous manner of telling a story, his crudities of style, his inability to crystalize an emotion in a phrase or a scene in less than a chapter—these are the most obvious externals, and therefore need not detain us. For there must be something indefinably powerful about an author whose Complete Works consist of only three painstaking novels and yet are reckoned "a force and a fresh impetus" wherever Literature is known; whose first book, *Sister Carrie,* was refused by almost every publisher in this country, and yet, upon its appearance in the meanest of paper and typography, was ranked as one of the greatest pieces of work ever produced in America; a man whose name was unknown by the book-devouring public at the very time it was being hailed by such a variety of critics as Arnold Bennett, Frank Harris, John Galsworthy, Floyd Dell, and the unusually caustic H. L. Mencken. And this bigness that smothers all petty criticism is the man's vigorous sincerity. No craftsman living today, no matter what his art may be, has less of artifice than Theodore Dreiser—in fact, from a standpoint of outward beauty and esthetics, much of his work would be improved were there more of it.

On the very first page of his new novel, for example, is this passage:

> Young Cowperwood's father was a bank clerk at his birth, and ten years later, when young Cowperwood was turning a very sensible, vigorous eye on the world, his father was still a clerk, altho a much more trusted and desired one, and was so near a tellership that there was not the least doubt in the world that he would get it.
>
> The next year, because the president died and the vice-president became president, the cashier was made vice-president, and Mr. Henry Worthington Cowperwood was moved into the place vacated by the promoted teller. He was a happy man. It meant the munificent sum of thirty-five hundred dollars a year, and he decided, as he told his wife joyously the night he heard it, that he, or they, rather, would now move from Number 21 Buttonwood Street to Number 124 New Market, where there was a nice brick house of three stories in hight, as opposed to the one of two stories which they now occupied.[1]

Taken from its context this fragment may seem unimportant, but it has the same value that a single drop of blood may have under the microscope. Here is the author's almost ridiculous love of detail, his much too careful eye for truth, his meticulous preciseness of incident—and underneath it all is the honesty and power of his vision. Mr. Dreiser calls on no exterior glamor for aid; the Fact is glorious enough for him; it is the beginning and the end of his art; it is his all in all. He is no doctrinaire; he has no economic axe to grind; no panacea to relieve the ills of the world; no mental Balm of Gilead to smear unctuously over the perplexed soul. He voices a frank but jubilant materialism; he is concerned but little as to the justice of things—whether they are good or bad interests him less than whether they are. With all its contradictions and muddled tragedies Life is to him a very moving and noble thing; he sees no reason why he should color it, distort its values or eliminate any part of it—if it is worth while living, it is worth while writing about. He does not even seek to dignify the commonplace; he finds it glorious and romantic

[1] *The Financier.* By Theodore Dreiser. New York: Harper & Bros. $1.40.

enough. Every incident, every casual interchange of thought is to him a vital thing—and so the tale of half the life of Frank Cowperwood (from his youth to middle-age) consumes seven hundred and eighty closely printed pages—the other half is still to be told!

And it is just because of this insistence on the value of life's minutiæ that Dreiser's work is so often powerful rather than final; big without being great. A greater artist would choose from this welter of facts, would eliminate, condense and give us the essentials in a less tortuous manner. Dreiser's method of approaching a point may be described as an ever-narrowing spiral. But it is this very circumlocutory process that enables him to display his most effective gift—the building up of character. No living author has a sense of characterization more keenly developed; possibly no one since Balzac has drawn such amazing portraits as old man Gerhardt; as the pathetic Jennie, floating thru life, unable to strike out for herself; swept on by whatever waves carried her; the pitiful spectacle of Hurstwood; the brilliant and blind strivings of Carrie Meeber—these are all etchings none the less beautiful because they are laborious. And now comes Frank Cowperwood, the "Financier"; an arresting, and to many, an irritating figure; an unmoral, capable, generous, shrewd, ambitious manipulator, taking what he wants, untroubled by codes, ethics or conscience. From the moment when, at the age of thirteen, he makes his first "deal" in soap, one sees in him the outlines of something unquestionably big. Aileen Butler, with whom he falls in love, after ten years of vapid wedlock, is not so fully drawn—but her development in the forthcoming sequel will be interesting. It is this genius for character, together with the power for revealing the chaotic surge of life, that will reward the reader for plodding thru the many tedious intricacies of banking, politic, and a court trial. One wishes at times for more sensuousness, more refinement of expression and less baldness of narrative, but once in the midst of the story one feels that the charm of such prose as, say, Meredith's, Moore's or Wells's would be out of place here; one is satisfied to find beauty in what Mr. Dreiser says rather than in how he says it. A gaunt beauty, perhaps, like a bronze of Rodin's or a wild tone poem of Richard Strauss—but it is a moving beauty, even if it moves with its power instead of its poetry. *The Financier* must be ranked as one of the finest contemporary novels, even tho Mr. Dreiser has the instincts of a portrait painter rather than a novelist. It is above all a splendid life-size portrait of a man ("in the Dutch manner," Lucian Cary says) against the vast background of America—tremendous, in spite of (or, possibly because of) the fact that it is often as vague, as tedious and as formless as life itself.

At Castrogiovanni

A little of the old Pagan cult—every poet has an infusion of it, if he is worth anything—is at the bottom of George Edward Woodberry's latest collection of poems, *A Day at Castrogiovanni.*[2] There are but three of the poems, and a preface, which is in itself as good as a poem. Thru all filters a worship of Spring, when

> The fields breathe sweet, the daisies kiss
> our feet—

Spring on the slopes of the Sicilian hills, and on the one particular group of them within whose folds Proserpine one day, in a wandering forgetful mood, went a-maying, and by a dark-eyed lover was surprised and spirited away, yet, by higher intervention, was permitted to come back once a year and toss a lapful of blossoms in the valleys hard by Castrogiovanni. At the early morning hour, when far-off Etna, "dim base to rosy plume," blushes with the dawn, the poet is there, wakened by the singing of nightingales.

---

[2] *A Day at Castrogiovanni.* By George Edward Woodberry. Printed for the Woodberry Society. Boston: The Merrymount Press.

The wan,
Worn moon turns snow, and worships, as it dies, . . .
The Star to which all glory hath been given,
The orb of life whence all things here have been.

To be roused by such a note, to look out upon the "rosy-tinged" vaporous incense ascending from the high top of Etna—this is an invitation not to be resisted by any poet, to go down into the valleys for a glimpse of the beautiful bride of the dark-eyed lover—the bride with the blossom

Whiter than Phosphor in the golden morn;
The bright narcissus she was wont to wear,
The star of Springtime shining in her hair.

The mind readily passes back over the ruins of many forms of worship to the day when the γῆ μητήρ, Demeter, the earth-mother, was very busy in the valleys, and the διοῦ πατήρ, Jupiter, the sky-father—the heavenly father—grew very soft-eyed above the mountain tops. Here was the two-fold origin of all life on earth, with an invisible and robust cave-dweller peeping out longingly from the mountain caverns—

The mightiest lover that the world has known,
Dark lover, Death,—was he not beautiful?

The Giver of life above; the Taker of life below; and, midway, Life itself—the beautiful daughter of a beautiful mother, startled amid her guileless wanderings by the sudden apparition of the dark lover.

No living eyes have seen him save thine own,
And hence he bore thee to the dark deep under,
Far from the beauty of this heaven-bright zone,
Where the corn ripens in the summer thunder, . . .

O Proserpine, dream not that thou art gone
Far from our loves, half-human, half-divine;
Thou hast a holier adoration won
In many a heart that worships at no shrine.
Where light and warmth behold me,
And flowers and wheat enfold me,
I lift a dearer prayer than all prayers past.

This ideal cult, developed by the author thru two poems of rare excellence, is repeated and expanded in the fine poem — "Demeter" — expanded, and then somewhat regretfully flashed off the stage:

The spirit-thronged world has passed away,
And shorn of terror is the sun's eclipse;
Science has dulled our wonder day by day;
No awe, no silence lingers on our lips;
For deity in things we do not look;
Now closed to all the gods is nature's book.

The book of nature closed, the book of Man opens:

Lo, I have believed in all the gods in turn,
And know they have no being but in me;
All is the form of what doth inly burn,
Up from the fetich to eternity;
Wherever man doth pray, and finds faith there,
I kneel beside him and repeat his prayer.

The religion of humanity emerges, as the only road to the higher knowledge yet to come. Man in his hight and depth has the only key:

There is no truth save what to him is known;
There is no beauty save within his eye;
There is no love save what in him has grown,
And only in his mandate right does lie;
Justice and mercy his, and good and ill,
And virtue throneless save within his will.

Yet in spite of this overthrow of the old man-made gods, the old worship survives for the poet,

And old divinity forever keeps
Some portion in the consecrated soil;
And what was sacred once is sacred still—
Lo, great Demeter, I salute thy hill.

At the old Pagan altar, poetically glorified, and equipt with the latest version of human aspiration, he kneels, and offers his thanksgiving prayer:

I thank thee for thy food thru sun and rain,
The Summer's wealth, the Winter's garnered store;
And ever thee I thank, and more and more,
For the hope hid in kernels of the corn,
Great mother, vanished from the mountain's horn.

A trio of poems of true feeling, religious aspiration, and rare beauty of form.

To this volume we may add three volumes of prose criticism: in part Lowell Institute lectures.[3] The critical work is everywhere of the finest, the literary finish of the highest, and the appreciation tinged always with an infusion of the Pagan spirit—always with a chivalrous tendency to pull off the "upper dog," without inquiring too closely as to which dog began it. Civilization—not theocracy, aristocracy, nor yet democracy, but that civilization which appeals in every case and in all classes, to nobility of mind, has often occasion to play the upper dog. In the case of Shelley, Byron, Swinburne, Whitman, a fair mansion, built up with care, has found in society an able defender of itself against an exaggerated sense of the importance of genius. Mr. Woodberry does not carry his aversion to the upper dog to the extent often seen in the more recent criticism; yet he does more than justice to the quality of Greek art in Swinburne's early verse. He very gently dismisses what was entirely unsound in the poet's musical measures as the vehicle of thought and experience, giving it a decent interment in the fine wrappings of a beautiful rhetoric, and dwells with all the greater delight on what was new and justly pleasing in the poet as a son of grace and protégé of the Muses thruout his later life—a privilege which Swinburne surely earned.

Army Life of an Under-Officer

Col. Mason Whiting Tyler's *Recollections of the Civil War* is a detailed narrative of his service as private and officer from his enlistment in July, 1862, to his wounding on March 25, 1865. His regiment was the 37th Massachusetts, and he was at Fredericksburg, Chancellorsville, Gettysburg, the Wilderness, and Petersburg. He also served under Sheridan in the Valley campaign, and during the draft riots was transferred to New York city. The book gives a vivid picture of this experience. The campaigns and the battles in their larger aspects are on the whole well narrated, and there is a frequent reference to official reports for confirmation; but the story is written from the individual rather than the general standpoint. The editing and filling in of connecting links has been done by Colonel Tyler's son, William S. Tyler, and by Rev. Calvin Stebbins. Illustrations and maps add value to this careful and sincere work. (Putnam. $2.50.)

Literary Notes

A book like *The New Hostess of Today*, by Linda Hull Larned (Scribner, $1.50) is sure of a welcome, for its directions, whether for simple or elaborate entertainment, are both sensible and clear.

A new idea in the making of confections, that of using vegetables as a base, is described by May Elizabeth Hall, a practical confectioner, in *Candy-Making Revolutionized.* (Sturgis, 75 cents.) Wholesomeness as well as toothsomeness is claimed for the new concoctions.

Denman Ross, of Harvard and the Boston Museum, in his essay on *Drawing and Painting* (Houghton, $2.50), tells collector and student alike what is the way of art. "No one who wants to learn to draw should go near any of the art-schools," writes this lecturer on the theory of designs; art-schools being "blind-alleys." Dr. Ross examines, however, the "orderly palettes" of the Old Masters; he also diagrams and explains them and lays their methods before us. "We should follow the practice of the Masters, at least until we can paint *in form.*" The essay is digressive, delightful, and scholarly.

A contributor to the Paris *Revue* quotes a number of literary stupidities—not all of them to be found in Flaubert's portfolio of human stupidity, as described and sampled by Guy de Maupassant. One French writer is credited with the startling phrase, "He was seventy years old, and looked twice his age;" another with "The two adversaries were placed at an equal distance from each other." This sounds like a passage from an American best-seller, but who was it that said: "With one hand he fondled her hair, and with the other he said to her . . ."?

It was Corneille the greater who wrote: "This shall cost Pompey his life and his head." The dramatist Scribe in his inaugural speech before the French Academy, reproached Molière with having failed to mention in any of his works the Revocation of the Edict of Nantes. (This occurred in 1685—when Molière had been dead twelve years.) Hugo, apostle of antithesis and local color, makes Charlemagne say in the *Lé-*

[3] *The Torch.* By George Edward Woodbury. New York: The Macmillan Co. $1.25. *Great Writers. Ibid.* $1.25. *Swinburne. Ibid.* $1.25.

gende des Siècles: "You dream, like a clerk in the Sorbonne;" an institution founded in 1253. Of the critic Janin it has been written: "He had a horror of inexactitude." All the same Janin makes Smyrna out to be an island; Cannes on the Mediterranean to be the central Italian Cannæ; the River Rhône to pass thru Marseilles—fifty miles away. What wonder if THE INDEPENDENT, too, sometimes falls into error?

"Aware of my long association with the subject of these lines, I have been actually pestered by my friends, and perhaps others, with suggestions that I jot down some of the characteristics, incidents, impressions, and conclusions gathered during many years of close business relations with the foremost actress of our times." Thus does Frank Carlos Griffith open his account of *Mrs. Fiske.* (Neale, $1.) One may judge from this sentence, of which we quote only the opening clauses, what are the literary qualifications of Mrs. Fiske's former acting manager. The American actress has, however, many admirers: and these will find that there are a few interesting facts recorded in the 146 pages, and many portraits to treasure.

Prof. M. G. Kyle has put forth a large claim for archeology in the investigation of biblical literature, as is evidenced in the title of his new volume, *The Deciding Voice of the Monuments in Biblical Criticism* (Oberlin: Bibliotheca Sacra Co.). On the ground that "no critical theory concerning the Bible is to be finally admitted into the faith and life until tested and attested by archeological facts," he encourages us still to believe that the Pentateuch comes from the Mosaic age, that Isaiah is a unity, and that Daniel is contemporary history. The archeological evidence for these theories is, however, acknowledged not to be conclusive, and we may hope that the final verdict of archeology will be less antagonistic to scholarship.

Columbia University greeted Professor Bergson on his arrival Feb. 2 with a useful pamphlet entitled *A Contribution to a Bibliography of Henri Bergson,* prepared by the University Librarian, W. D. Johnston, and publisht by the University Press (25 cents). Professor John Dewey, who is in some respects in close sympathy with the Bergsonian philosophy, contributes an introduction. It is a striking evidence of the widespread interest taken in Bergson's work that this list includes over five hundred books and articles, mostly written in the twentieh century.—H. Wildon Carr, the pioneer exponent of Bergsonism in England, gives an admirable account of his system in *The Philosophy of Change,* publisht as No. 26 of that handy series known as "The People's Books" (New York: Dodge Publishing Co. 20 cents).—Two translations of Bergson's essay entitled *An Introduction to Metaphysics;* one, the authorized version, translated by T. E. Hulme and publisht by Putnam ($1) and the other translated by Sidney Lippman and publisht by Luce, Boston ($1).

Dr. S. M. Zwenner has made a careful study of the references to Christ preserved in Mohammedan writings, and he finds that, altho by the teaching of tradition and current thought among the great masses of his folowers Mohammed has "usurped the place of our Saviour" and become in a real sense *The Moslem Christ,* such a result has come about only thru ignorance of the truth about Jesus and a prejudiced reading of the Koran itself. He declares that

> one cannot help feeling that the Moslem who has carefully studied the Koran will come to the conclusion, independently of all the commentators, that Christ is superior to Mohammed.

But "the commentators," particularly the dogmatic ones, demand a hearing in the interpretation of every sacred book, even the Bible. (American Tract Society, $1.)

From A. C. McClurg & Co., of Chicago, we receive two small purple volumes, illustrated, in an English series entitled Little Books on Art: *Benvenuto Cellini* and *Auguste Rodin* ($1 each). Robert H. H. Cust, of Oxford University, contributes the book on the Italian, Mme. Muriel Ciolkowska the one on the French sculptor. The list of works and the index to each volume are desirable features; so, in the *Rodin,* are the dates of exhibitions, list of statues in the Metropolitan Museum of New York, and Bibliography. The *Rodin* book is too obviously a translation. Moreover, it is far more notable for its quotations from French and Belgian critics than for anything original. Yet Madame Ciolkowska is at least enthusiastic; as she herself writes, "criticism of Rodin's work has never been moderate." She offers a useful handbook of dates, places, circumstances, and somewhat hectic generalizations; bringing a considerable body of ill-digested material within small compass. Would the sculptor, himself, we wonder, accept this estimate:

> Rodin has indeed glorified life rather than transposed it. He is, therefore, not an esthete, tho he enjoys many esthetic pleasures: Nature, architecture, Oriental art, for example. Fastidious selection is supposedly estheticism. Rodin is too enthusiastic, too famished after beauty, to select. He is overwhelmed.

SURVEY of the WORLD

News of Nero

Recent excavations in Rome of Nero's "Golden House," where at length the Emperor found himself "lodged as a man should be," have brought to view certain mural paintings, which, according to first conjectures, not yet verified, are illustrations of Nero's own poem, the *Troica*. If they really do illustrate the *Troica* they will throw some light on a matter about which people have been curious any time these past nineteen hundred years.

For everybody knows that Nero fiddled and sang when Rome was burning, and many who have not forgotten their early Latin readings will recall that the words of the song he sang on this interesting occasion were none other than that passage of his own poem, the *Troica*, which described the siege of Troy. This egotistic circumstance added vivacity to the narrative of Suetonius and venom to that of Tacitus. Indeed, one might think, from certain Roman writers, that Nero's chief offense was not so much in setting Rome afire, as in reading from his own works when it was burning.

He was curst as roundly by Roman poets for having written bad verse as for having murdered his mother Agrippina, his aunt Domitia, his father Britannicus, and his successive wives and all the rest of his relatives. To have written the *Troica* seems, in the opinion of his fellow-poets, to have been his crowning infamy. One of them, in comparing Nero with another parricide, remarks, After all, that other parricide did not write the *Troica*. Anything, therefore, that will indicate the nature of this, the most awful of Nero's misdeeds, will gratify a famished curiosity.

SKEINS OF "SILK" MADE FROM WOOD

The Silkworm Has a Rival

With the increase of the human race and its many new necessities, there seems always to arise at just the right time a method of supply. The old way of obtaining silk from the silkworm will continue probably as long as the world shall exist, but to care for the silkworms and to wind the silk is so slow and tedious a process that silk must always be high-priced and its use limited to the few. But now comes the modern invention of viscose or artificial silk from wood. Just as we had to abandon flax and cotton for making paper, and chop down trees to produce the tons and tons demanded, so now we are abandoning the silkworm with its slow and expensive processes, and are putting the trees into the mill, grinding them up, treating them in a certain chemical manner, most of which is secret, so

as to produce not exactly an equivalent for silk, but in many respects a material that has wider adaptability and greater availability than silk. This new silk is readily manufactured into a close imitation of human hair, and for the various intricacies of feminine headgear of puffs and pads and frills and rats and of other things, this new silk surely has a decided advantage as it does not give the wearer the feeling that it came from some head of uncertain cleanliness or desirability. The artificial hair is even more cleanly than the natural, because it has gone thru chemical processes which make it practically pure, literally so in the sense in which the term is commonly used.

A CLOSE IMITATION OF HAIR MADE FROM WOOD SILK

This new silk has a decided luster, and gives the fingers a pleasing sensation; it is not harsh and irritating, as some forms of silk fabrics are inclined to be. In lacework beautiful patterns may be readily formed, and patterns adapted to true silk lend themselves as readily to the artificial. It takes color readily, and hence is valuable for many kinds of fabrics where true silk, on account of its greater expense, would not be so used. The viscose silk is especially attractive for fabrics that need to be repeatedly folded, as neckties that must be repeatedly tied and untied, or ribbons that are to be formed into bows and similar objects.

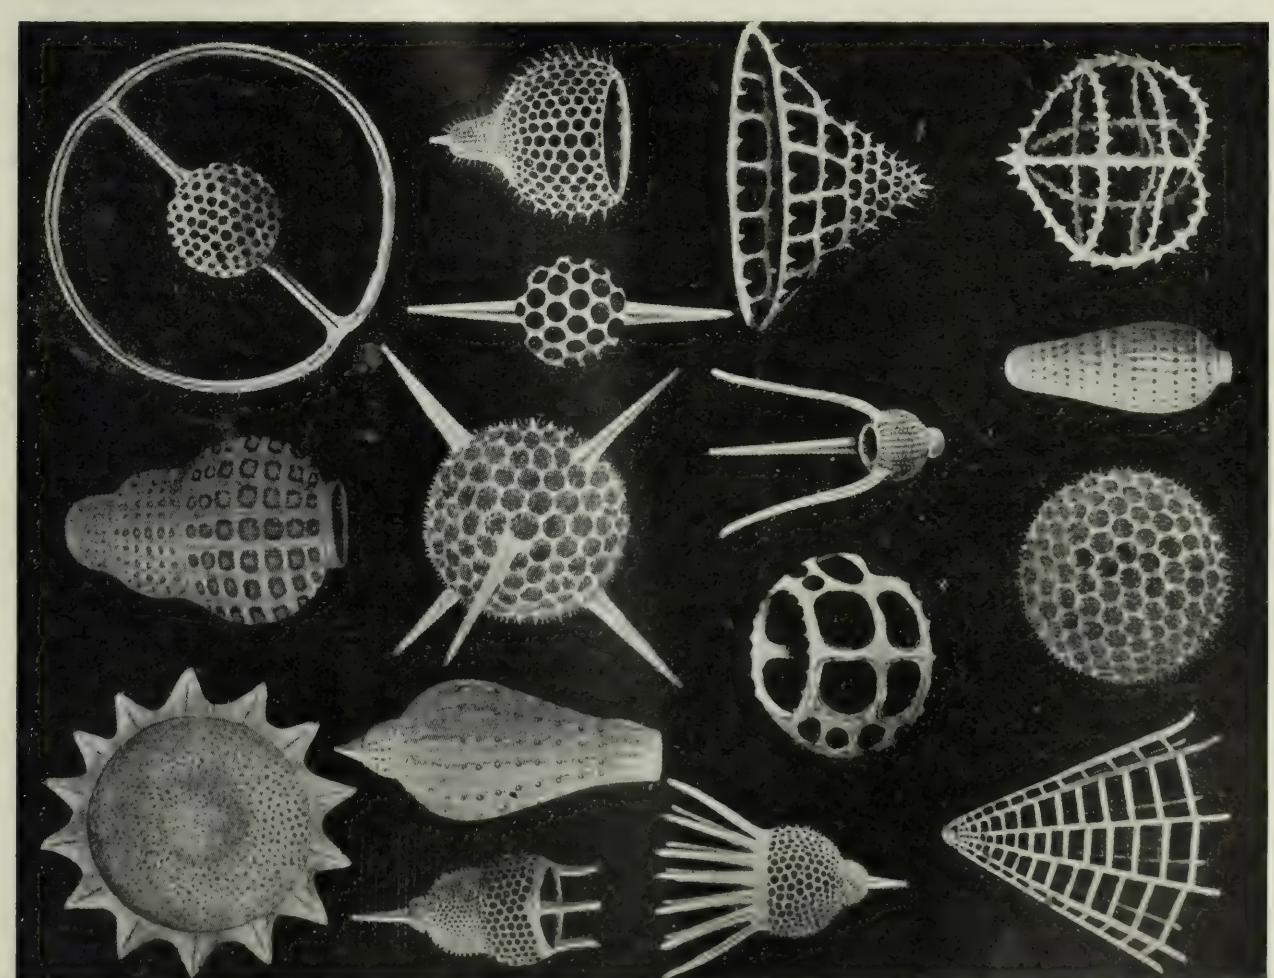
English Trade Unions and Politics

The House of Lords since Christmas has had to deal with three bills, each one of which represents a triumph for one section of the coalition which is keeping Mr. Asquith in power. The first was the Home Rule bill for Ireland—the reward of Irish Nationalist support of the Liberals. The second was the Welsh Disestablishment bill, passed for the sake of the Welsh Nonconformists. The third, known as the Osborne bill, was passed by the House of Commons in response to the demand of the Labor party. This bill was greatly disliked by the Unionist leaders, but so strong is the voting power of the trades unions that the bill was allowed to pass its third reading without a division; and it is expected that, unlike the Home Rule bill and the Welsh Church bill, it will not be thrown out by the House of Lords. The bill takes its name from a railway man named Osborne, who in 1909 brought an action against his trade union to restrain it from using union funds for fighting Parliamentary elections. The action was decided against Mr. Osborne, but he carried it to the Court of Appeals, and thence to the House of Lords, where in February, 1911, it was finally decided against the trade union.

The trades unions, which now have forty members in Parliament, found themselves much hampered by this decision To ease matters for the labor men, the Government in 1911 provided salaries of $2000 for members of Parliament. This, however, did not appease the Labor party, for in England candidates have to pay all the expenses of elections, and it was consequently difficult for the trades unionists to contest seats. Consequently in the session of 1912—the session now drawing to a close—a bill was introduced making it lawful to finance elections and support candidates out of trade union funds, providing that any member of the union who objected to the money being so used should be exempted from contributing, while being permitted to remain a member of the union for all other purposes.

The English trade unions have increasingly concerned themselves with politics since 1900. From the Liberal Government, since it came into power in 1905, they

have obtained the Workmen's Compensation Act of 1906, the Trades Disputes Act of the same year, which exempted trade union funds from liability for damages due to strikes, old age pensions, the National Insurance Act, payment of members of Parliament, the eight-hour day for miners, and a minimum wage law, also for miners.

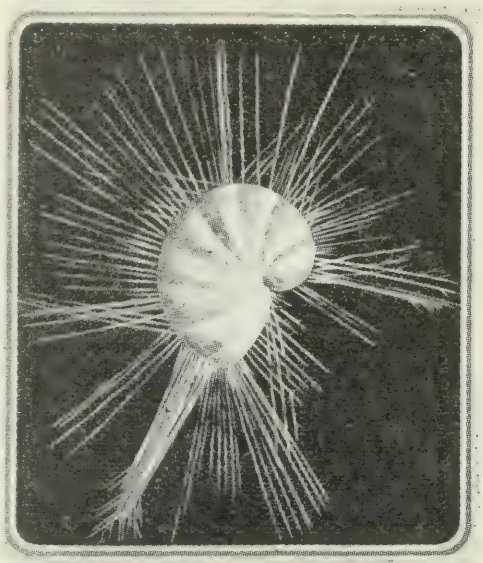


Organized Labor and the Sherman Law

There is absolute agreement among labor leaders on the point that the interpretation of the Sherman Anti-Trust law, as exemplified in the suit of Loewe & Co. against the United Hatters, is a deadly menace to organization. That action is now pending on appeal to the United States Supreme Court, the decision of the lower court having been adverse to the union. As illustrating the construction likely to be placed on the law if that decision is upheld, it may be stated that the United Mine Workers of America is being sued for $750,000, for damage claimed as resulting from a strike in the mining regions of West Virginia.

The principle sued upon is the same as that which was upheld in the famous Taff Vale decision in England, now set aside by act of Parliament. The American Federation of Labor is seeking the passage of an amendment which shall clearly differentiate between combination for the sale of labor products and combination for the sale of labor power. The law as at present written and construed makes any combination unlawful if it interferes with the freedom of interstate or foreign commerce.

Nature the First Artist

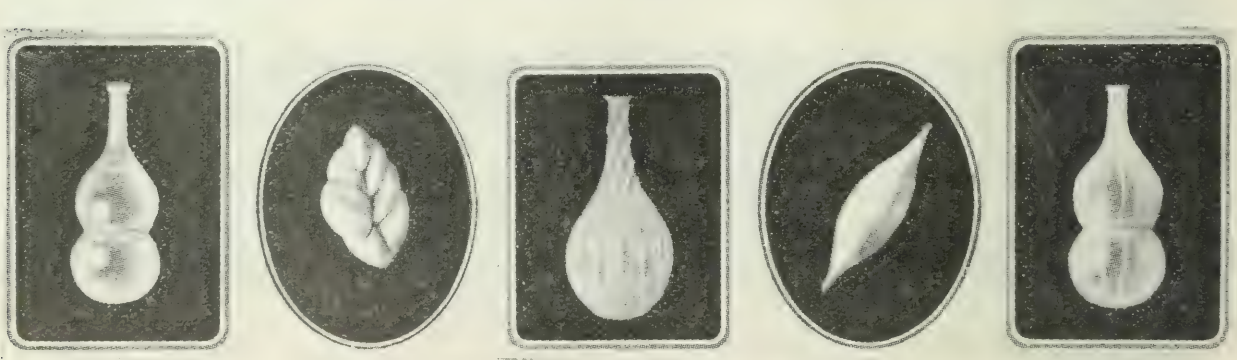


The open question as to whether man has ever excelled the designs of automatic nature becomes still more puzzling as the microscope pierces deeper and deeper into the minute universe. The pictures, here selected from the London *Illustrated News*,

ART FORMS OF NATURE.

In all ages of the earth Nature has wrought with greatest care each minute and unseen part. The silicious dust deposited in the depths of the ocean and forming many rocks reveals under the microscope such beautiful shapes as these, each the skeleton of a radiolarian whose pseudopodia were projected thru these tiny orifices. Drawn from nature by Percy Collins for *The Illustrated London News*.

are of the microscopical constituents of rock found in Barbados. The stone, which lies in stratum more than a thousand feet thick, was recently examined and found to be built entirely by infinitesimal animals called Radiolaria, whose shells have fossilized. These deserted homes left by secret designers are of almost unbelievable intricacy, and yet are so small that millions of them could be contained in a teaspoon. The living representative of this family to-day exists in nearly all sea water, and their minute shells form the ooze on the bed of the Atlantic Ocean. While living the animals swarm in the waters to a depth of 3,000 feet. After death the body dissolves and the shell sinks to the sea's floor, forming a soft gray mud. Approximately 50,000,000 square miles of the ocean bottom is covered to a depth of many hundreds of fathoms with these deserted houses of life. The enormous pressure of water above them is unable to crush or injure this frailest of all architecture. There is, moreover, something dramatic in the thought that these beauties should have first been revealed to the cold practical eye of the scientific investigator.



One of the lowest forms of life; a wonderful living foraminiferous organism, showing the jelly-like animal streaming out thru the pores of the shell, doubtless in quest of food.

Healthy Carriers of Disease

A problem which physicians are attacking, with no satisfactory results as yet, is how to deal with the healthy carriers of disease. In diphtheria the frequent occurrence of the bacteria in well persons is a serious obstacle to the extirpation of the disease. The bacilli are as virulent as those found in diphtheria patients and are disseminated far and wide. Antitoxin cures the disease, but it does not destroy the germs in healthy persons.

Another disease that is spread chiefly by healthy persons is epidemic cerebrospinal meningitis. Its specific germ, *Diplococcus intracellularius, meningitidis,* is easily killed in persons suffering from the disease, but it thrives also in the noses and throats of entirely healthy persons, who communicate it from one to another, and in whom there is no reason for suspecting its presence. The number of these healthy carriers during an epidemic greatly exceeds the number of cases. It is even said that nearly a fourth of the persons in the neighborhood of meningitis cases act as carriers. In only a small proportion of the persons who shelter it does it actually invade the tissues and cause the disease.

The latest investigations seem to prove that this is true, tho to a less extent, of infantile paralysis or poliomyelitis. Its virus has been found in apparently healthy persons who lived in the immediate vicinity of the patient. It is also believed that during an epidemic of the disease the "virus carriers" exceed the number of actual cases. The transmission of the virus thru their agency and thru abortive cases is thought by some to account mainly for the spread of the malady, altho experiments made during the last five years under the Massachusetts State Board of Health point to the stable-fly as a frequent carrier.

Japan's Slow Railway Progress

At the root of the recent Cabinet crisis in Japan are the divergent views as to the proper application of the national resources. The commercial classes oppose the expenditure of the public moneys on military and naval expansion. On the other hand, the military party does not believe it safe, in view of the present international situation and especially of the disturbed conditions of China, to pursue a standstill policy as regards the army and navy. For a long time past they have demanded the increase of the army by two new divisions for service in Korea. The War Minister in the former Cabinet insisted on this, and when the increased estimates were refused he resigned. Prince Saionji, the Premier, being unable to fill his place, the fall of the Cabinet followed.

One of the chief contentions of the commercial element who are opposing unproductive expenditure is that Japan ought to advance more rapidly in railway development. Under the burden of the war debt the Government has pursued a cautious policy, and the advocates of railway expansion are complaining of slow progress. They contrast, rather unfairly in view of essential economic differences between the two countries, the growth of railway mileage in Japan during the last forty years with that in the United Kingdom between 1830 and 1870. Since the Tokyo-Yokohama line was opened forty years ago, Japan has built 5355 miles of track, as contrasted with 15,537 miles built in the United Kingdom from 1830 to 1870. With some 20,000 miles less of territory the United Kingdom has today about four times as many miles of railway as Japan.

The state railways are not regarded as a source of Government revenue in Japan, but are kept in a separate account, and their profits are applied to improvements and extension. Some of the more cautious spirits would limit expenditures to the profits of the railways themselves—a matter of 10,000,000 yen a year, but the Government has proposed undertakings which involve an expenditure of 50,000,000 yen, and tho it has since curtailed this to 30,000,000 yen, it is not believed that it will carry its policy of retrenchment so far as to withhold state aid from the railways.

A Black Week in Mexico

The tragic deaths of Francisco I. Madero and Jose Pino Suarez, at a late hour last Saturday night, were the closing events of a week that will be memorable in the history of Mexico.

After the breaking of the armistice which the foreign Ambassadors had demanded, the artillery duel was resumed. Felix Diaz still held the arsenal and was gradually extending his lines. President Madero promised to capture the rebels' stronghold, but his soldiers, who had repeatedly attacked it in vain, were not in a hopeful mood. On Monday, General Blanquet, as to whose attitude there had been some doubt, came to the capital with 1200 men. He joined General Huerta, the commander of Madero's army. They decided that Madero must go. On the following day Madero, under pressure, resigned, and Blanquet ordered his arrest. He was taken into custody after a contest, in which Colonel Riverol, of Blanquet's command, was shot by the President or one of his associates. At about the same time Gustavo Madero, the Minister of Finance, was arrested in a restaurant.

Gustavo, the deposed President's brother, was taken on Wednesday as a prisoner to the arsenal. Huerta had been proclaimed Provisional President and had made terms with Diaz. A short time after Gustavo's arrival at the arsenal he was killed. Soldiers shot him, it was said, as he was trying to escape. He was the victim of a Mexican law which has frequently been used in getting rid of undesirable persons. Francisco Madero was spared, owing, it is understood, to the efforts or advice of our Government. He was to be sent into exile. Huerta complained that Madero had twice sought to procure his assassination. As Madero was about to start for Vera Cruz on a special train, Huerta decided to restrain him, and he was again imprisoned. He was to be tried, it was announced, by the new Cabinet. The names of several of the new Ministers, that of De la Barra included, had been found in a list prepared by Madero and headed with the words "Those who ought to die."

There were indications of a revolt against the rule of Huerta. The Governors of several States declined to accept it. Orozco, Salazar and Emilio Gomez, leaders or rebellion in the north, hesitated. They preferred Felix Diaz. At last, however, they consented to accept Huerta so long as Diaz should be in harmony with him. But Figueroa, Inspector General of rurales, turned against the new Government, and it was said that several thousand men would fight with him. Precautions were taken by our Government, and four regiments of infantry were ordered to Galveston, but Mr. Taft was firm in his purpose to avoid intervention.

Dispatches publisht Sunday morning said that Madero and Suarez, the deposed

President and Vice-President, had been sent to the penitentiary, to remain there until Madero's trial. It was known thruout the world on the following morning that they did not reach the penitentiary, but were killed in the street on their way. They were in an automobile, escorted by troops. Huerta says that the party was attacked by Maderists and that the two prisoners were shot while trying to escape in the course of the engagement. He promises a most thoro investigation. An impression prevails, however, that again, as in the case of Gustavo Madero, the Mexican law concerning fugitives was found convenient for the removal of the two men. Denunciation, thruout the world, of what is believed to have been cold-blooded assassination, is accompanied in the press of several European cities by suggestions that intervention by our Government is now required, but this is not the opinion at Washington.

The Conquest of the Desert

On the extreme western slope of the Rockies, a few miles above the point where the red canyon of the Grand River spreads out into a beautiful and fertile valley, famous the world over for the abundance, variety and quality of its fruit, as well as for its unique scenery and delightful climate is a new government camp of more than one hundred men busily engaged in an undertaking which was formally inaugurated by the Reclamation Service on October 22, 1912.

On that date hundreds of people from all parts of Colorado, including many first settlers of the western slope, assembled to celebrate the breaking of ground on the Grand Valley irrigation project, the promotion of which has extended over more than twenty-two years of alternate hope and disappointment. Under President Roosevelt and Secretary Garfield the success of the project seemed assured and camps for the workmen were begun, only to be abandoned when Secretary Ballinger came into office. In the autumn of 1909, President Taft visited the Grand Valley and became much interested. The board of army engineers was sent west, and, after a thoro investigation, reported favorably. As soon as possible Secretary Fisher, always friendly to the project, gave the order to begin work. In gratitude to him, on opening day the overhanging granite mountain near the point where the water will be diverted from the river, and thru which the first tunnel, 3700 feet long, is now being bored, was christened "Mt. Fisher" amid cheers which reverberated thru the deep canyons.

By means of this irrigation system 52,000 acres of new desert land will be reclaimed, at an approximate cost of $4,000,000. The cost per acre is almost the maximum of any Government work thus far attempted, but the exceeding fertility of the soil and the value of its products justify the expenditure.

It is estimated that within four years the concreted tunnels, aggregating two and one-half miles in length, and the open

PORTAL OF TUNNEL NO. 1, STRONGLY TIMBERED, 14x16 FEET WHEN CONCRETED

MT. FISHER AND THE GOVERNMENT CAMP AT ITS BASE

ditches, will be carrying water more than fifty miles down the valley, redeeming the last acre within reach of the long canal and its many laterals.

The work is under the direct supervision of Project-engineer J. H. Miner, a Cornell man of experience in Government work, having served on the famous Uncompaghre project. The camp is a well managed and orderly establishment and careful attention is given to the comfort of the men, most of whom are foreigners. The food is excellent, the bunk-houses well ventilated, and there are baths, electric lights, steam heating and a Victrola, the last, however, under private ownership.

EMMA C. PAGE.

What Congress Is Doing

It was expected that Congress would pass the Immigration Bill over Mr. Taft's veto, but there were not enough votes for it in the House. The bill was disapproved in the Senate by a vote of 72 to 18. In the House there were 213 affirmative votes, or a few less than the required two-thirds. The House bill for a physical valuation of railroad property has been reported favorably in the Senate, where there has also been a favorable report, four members of the committee dissenting, upon the bill (already passed in the House) incorporating the Rockefeller Foundation, with its fund of $100,000,000. In West Virginia, Nathan B. Goff, Republican, a judge of the Federal Circuit Court, has been elected Senator.

After a sharp contest in the House Committee on Naval Affairs, the annual appropriation bill was reported with provisions for two new battleships. Five Democrats voted with 7 Republicans for two ships, against 9 Democrats, who were counted for only one. The bill carries $146,618,000, against $123,150,000 in last year's bill. The pension bill recently passed appropriates $183,300,000, the largest sum ever granted. A notable increase of appropriations has been sharply criticised by a minority of the Democrats. The bill for public buildings, passed in the House by a vote of 184 to 46, was denounced by Mr. Fitzgerald, who pointed out that buildings were provided for many towns whose population ranged between 1000 and 3000. This bill is called the "pork barrel." Having been sent to the Senate, the committee there added $20,000,000, making the total a little more than $45,000,000. Some think that Mr. Taft will veto it.

Preventive Nursing

Two new special professions for women in the line of nursing have been coming to notice of late. In Boston, the Women's Municipal League started in 1909 a system of visiting by trained nurses to provide prenatal care for the babies of the city. Its work was so successful that last year a prenatal clinic was started in one of the hospitals, and now the Board of Health employs ten women to look after the twelve or thirteen hundred patients always on their lists. At present in most places only women of means, and among them only those who realize the advisability of such care, are likely to have medical care during pregnancy. A perfectly well woman hesitates to see a doctor regularly merely to be sure that she continues well. Yet such supervision, as the Boston records show, has an astonishing effect on the birthrate, the weight and health of the children and the number of cases of Bright's disease developed, as well as on the general health of the families to which the nurses come. Each nurse has eighty or one hundred patients, each of whom she manages to visit once in ten days. She watches all symptoms, takes regular tests, and advises in matters of dress, diet, exercise and occupation. At the first hint of irregularity the doctor is notified and the trouble remedied before it is fairly begun. As a result there were but two miscarriages the first year, one the second, and none in the last two

years; of four cases of Bright's disease, a percentage below the general average, all the babies were saved and three of the mothers; the percentage of stillbirths has been reduced from a general average of 3.8 per cent to 2.7 per cent. The babies, moreover, have had the added advantage of entering life better equipt, for while the average child weighs 7 pounds 2½ ounces, these babies weigh 7 pounds 15 ounces. The cost of this care has been only $2.61 per patient, a charge that most of the women treated can afford to pay. The service extends always over two or three months and often much longer. The educative effect on young mothers in particular has been marked, and the old, inefficient, old-wives' care is strongly counteracted. As a measure of efficiency, both as to the doctor's time, the nurse's profession and above all the health of the mothers and babies, the scheme is a success. The time cannot be far off when prenatal care will be an ordinary if not the usual thing in all classes. Even when the nurse loses time by having to report to several different doctors, the whole cost per patient, it is estimated, would be only $5 or $6. The advantage, at almost any price, is obvious.

The other new development for special nurses' work is indicated in a bill now before the Massachusetts Legislature, which provides for the registration of dental nurses. Few people outside the profession think of a dental nurse as anybody but the person who helps a dental surgeon in his extracting. Her work, however, is really preventive and prophylactic. Such work cannot ordinarily be done by dentists, as many people are as yet unwilling to pay for work not immediately necessary, while the dentist is forced to charge the same as for time spent in operations requiring more skill. The hygienic value of a really clean mouth is, however, of more significance in one's general health than we are apt to realize. Fortunately we are beginning to get the benefit of the knowledge long urged on us by the dentists, and to understand that the cleansing and polishing of every portion of exposed tooth surface indefinitely preserves the life and stability of the teeth. Registration of trained nurses engaged in this work has been in force in Connecticut for some time, and it is to be hoped that other States as well as Massachusetts will adopt the same measure.

Both of these new professions for women show the signs of the times. The work of both is preventive, both save the time of the more highly trained doctor and supplement his work, and they both are distinctly on the side of efficiency and economy, our modern fetiches, and for steady, normal health.

Pebbles

'16—I want some winter underclothes.
Clerk—How long?
'16—You boob, I don't want to rent 'em; I want to buy 'em!—*Princeton Tiger.*

"The Christmas belles are peeling," remarked little Johnny, as he heard a shoe drop in the guest room where sister's Christmas visitors were getting ready for bed.—*Chaparral.*

Hospitable Soph—Have some crackers?
Visiting Junior—No, thank you. I don't care for crackers.
H. S.—Then have some jam.
V. J.—No, thank you, I don't like jam without crackers.—*Punch Bowl.*

Son—Say, mamma, father broke this vase before he went out.
Mother—My beautiful majolica vase! Wait till he comes back, that's all.
Son—May I stay up till he does?—*Fliegende Blätter.*

"Why did papa have appendicitis and have to pay the doctor a thousand dollars, mamma?"
"It was God's will, dear."
"And was it because God was mad at papa or pleased with the doctor?"—*Life.*

"Did you ever have a cold," inquired the practical gentleman, "that you couldn't get rid of?"
"No," answered the purist damsel, "if I had had, I would have it now."
Thus the coolness arose.—*Princeton Tiger.*

At. 9 p. m. they were seated at opposite ends of the couch. At 9:30 they were slightly nearer each other. At 10 o'clock they were three feet apart. At 10:30 there was scarcely any perceptible space between them. At 10:45 there was no perceptible space between them. The young man spoke:
"Has your father gone to bed?"
"Yes, John."
"Has your mother gone to bed?"
"Yes, John."
"Do you think your little brother is under the couch?"
"No, John."
The young man heaved a deep sigh.
"It's your move," he said.—*Cornell Widow.*

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

VI—Making the Advertisement

Those who are wise in the craft of advertising are prone to talk learnedly about the difficulty of getting good advertising "copy." Some of the writers of advertising books dwell upon the difficult art of writing advertising copy. It is not an easy thing to write an advertisement that will pass the critical advertising agent, or the more critical advertiser. It is not so easy to write an advertisement that will "pull." The subtle art of writing advertising copy is no sinecure.

But I am inclined to think that there has been a lot of misleading tradition built up around the matter. The copy of the men who have made the greatest successes in the advertising field has been simple and not at all what one would call difficult literary composition. It has been simply telling about the things that were offered for sale. 'Way back in the days when Manly Gillam wrote the first advertisement in that intimate, chatty manner which became celebrated and immensely popular, he merely told about some good country butter the owner of the *Philadelphia Record* had to sell. He had never heard about the difficulty of writing advertising copy. He knew all about the butter, and he simply told people about it, in the simplest and most straightforward fashion. The advertisements sold the butter.

The trouble with much of the advertising copy of today is that it is too sophisticated. There is too much copy-writer in it. It is not the profoundly subtle thing to write advertising copy we are led to believe. It is just telling about the thing to be sold, in as simple and understandable language as possible.

Too much emphasis cannot be placed upon this. When a man or woman reads advertisements it is the same man or woman who reads newspapers and letters, and who engages in conversation. The writer of the most conventional advertisement would never presume to talk as he writes his copy, nor would he adopt the artificial and exaggerated style in conversation if he hoped to effect any definite purpose. Why should we exclude natural good sense from advertising copy? Do we delude ourselves with the notion that a person's judgment, tastes and perception are changed or clouded when they read advertisements? If so, we must rid ourselves of such a delusion, as quickly and thoroly as possible.

This sounds simpler than it is. It is the getting ready to write the advertisement that takes time and talent. When a person knows all about a thing, and all about the man to whom he wishes to sell the thing, he must needs be barren of ideas and ignorant of words if he cannot tell the man about the thing, in the form of advertising copy. But there is work in getting to know enough about goods to advertise them, and enough about people to get them to attend to the advertisement. It is the getting ready to write that takes time and brains.

The crucial stage of advertisement writing is getting the writer's system saturated with faith in the people to whom he is to make his appeal. The learning about the goods is drudgery. It can be accomplisht by one about as well as by another. It calls for devotion, patience and work. But to come to know the people well enough to qualify for the writing of copy that will move them is something of an art. Not every person can compass it; but few can. And it is usually the fact that those who find they have the faculty of influencing people become preachers, lawyers, teachers or salesmen. Sometimes they become bank presidents and officers in great corporations; and sometimes secretaries to Presidents of the United States.

A few of these rare men stay in the advertising business, and because they are few is the explanation of the existence of so much poor advertising copy. For a really good advertisement is not to be found upon every advertising page of every periodical—more's the pity! There are pessimistic people who profess to believe that as many as 75 per cent of all the advertisements printed are failures. I do not know, and am glad that I do not. If I were compelled to believe that I am sure I would not have the enthusiasm for the advertising business I have.

But I am sure that the average of efficiency might be raised to a much higher level if all writers of advertising copy would insist upon knowing their subject before they try to write about it, and thus be free from the necessity of making the fantastic and artificial appeals that go by the name of advertising.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Term Life Insurance

We have displeased—perhaps it would be more just to say we have failed to please—a correspondent at Racine, Wis., by our treatment of the question he previously raised in favor of term life insurance as against the endowment forms. He unreservedly expresses the opinion that "life insurance, like fire insurance, is for protection, and no policy written is really an investment, least of all endowment."

We cheerfully concede his right to entertain that view of the matter. A large number of people differ with him; and it so happens that this diversity of opinion does not alter the facts.

The various plans of life insurance in use exist chiefly because all the persons who seek its benefits are not environed by the same combination of circumstances. There are the young, middle-aged and old; the earners of bare living wages; of comfortable monthly or yearly salaries; the men whose professions yield them substantial incomes; and the owners of wealth. There are the married and the unmarried; the childless, and the father of a numerous brood. There are those whose dependents are to be protected during the days of their helpless youth; and those whose dependents—an invalid wife, a mother, an unfortunate sister—are to be saved from the rigors of age. And of not least importance, there is the worker himself—the premium-payer and burden-bearer—who may outlive his own usefulness, his own strength, his own means.

Term insurance serves a useful purpose. The system of life insurance would be defective without it; but it would also be just less than useless if that were its only instrument of beneficence. It is a splendid thing in an emergency—to protect a new and diminishing liability, to sustain financial credit when that is needed, to cover the mortgage on a home, or, for some other reason, to supplement existing forms of insurance of a more permanent character during a certain period of years.

When human nature is made over, or attains a higher degree of perfection than it has yet reached, men will perhaps faithfully perform all the duties of which they are capable, including those outlined by our correspondent when he advocates the exclusive use of term insurance in combination with savings bank deposits, investments in city lots, building association stocks and the like, in place of life insurance that provides comparatively large terminal cash values in twenty or thirty years. Such supplemental investments as he suggests can be made; but experience proves that they will not be made persistently.

We do not advocate life insurance as an investment within the strict and usual meaning of that word, and we recognize as its principal object the element of protection which it affords. But most of its forms, from ordinary whole- and limited-payment life to endowment, if carried thru, afford a means of combining protection with savings accumulation that is without a parallel. It may not be the most profitable form of "investment" possible, but it is the most practicable and the one most likely to be realized. As we write we recall the case of Cyrus W. Field, the projector and builder of the Atlantic cable, a financier, organizer, and shrewd man of affairs, whose entire fortune at the time of his death, at a ripe age, consisted only of the insurance he carried on his life.

To the young man starting in life, with a modest salary and no family obligations, we would recommend as much endowment insurance as can be carried without encroaching on the savings which he intends to use as capital in his future business. That thousand or two thousand dollars may be his salvation twenty or twenty-five years later. To the man of thirty, with a wife and two or three children, receiving an average income, a policy on the whole life or twenty-payment plan, convertible when his children are grown up for its cash surrender value, or into paid-up insurance, or an annuity. During the productive period, say from twenty-five to forty-five, the whole life or twenty-payment life policy is the most sensible and most serviceable. But, after all, the particular circumstances of the person to be insured must govern the choice of a plan at the time. There can be no hard and fast rule on that head.

Fire and Casualty Insurance

Indications are rapidly multiplying of late that fire insurance and casualty insurance, heretofore two distinct lines operated by different companies, are growing closer together; and that the time is not distant when the two systems will be merged under one management to the extent that State laws will permit. In Great Britain one company may write as many kinds of insurance as it desires—fire, life, accident, liability, plate glass, burglary, etc. But our laws prohibit this practice. As an alternative, a few of our largest fire insurance companies have organized or acquired casualty companies: notably, the Royal, which is operating the Royal Indemnity; the Liverpool & London & Globe, which controls the Globe Indemnity; and the London & Lancashire, which operates the London & Lancashire Guarantee & Accident. The Aetna Life has recently purchased the Connecticut charter of an unorganized fire company, and the Hartford Fire is forming a casualty company.

Scottish Union and National

The financial statement of the United States branch of the Scottish Union and National Insurance Company for the year ending December 31, 1912, shows a reinsurance reserve of $2,132,839, a gain during the past year of $109,350. The surplus has increased during the year $237,856, and is now $3,267,000. Notwithstanding the depreciation of all securities during the past year, there has been an increase in the assets of $286,861, so that the total assets on January 1 were $5,595,684. The whole statement shows a healthy growth, and the company is to be heartily congratulated on the results shown. The home office of the Scottish Union and National Insurance Company is in Edinburgh, Scotland, but the United States branch, of which James H. Brewster is manager, is in Hartford, Conn.

A Great Record

The Mutual Life Insurance Company of New York closed the year 1912 with $1,550,888,000 insurance in force, gaining $45,913,401. Its admitted assets on December 31 were $599,125,046, an increase for the year of $11,994,783. The company has appropriated the sum of $17,368,047 as dividends payable to policyholders during 1913, an increase over the amount paid in 1912 of $2,361,767. This dividend equals 33 per cent. of the total premium income of 1912, exclusive of premiums received on supplementary contracts and annuities. Considered from the viewpoint of policyholders, this is a notable record.

Sun Insurance Office of London

And now we come to a brief consideration of the oldest insurance company in the world, the Sun Insurance Office of London, founded in 1710 and therefore in the 204th year of its existence. The American branch of the company, the headquarters of which are in New York City, under the direction of Mr. J. J. Guile, United States manager, controls its own assets in this country, as provided by our laws, and pays its own losses without consulting London, is greatly appreciated by insurants thruout the American field for its conservatism and its conscientious treatment of policyholders. During 1912 the business of the company prospered, the gain in income was substantial, and the profit realized aggregated $120,755. The gain in assets was $103,000, bringing the total, on December 31, to $4,622,987. The sum of $143,000 was added to the premium reserve fund, bringing that security to $2,917,937. The surplus beyond all liabilities is $1,243,000. The Sun has paid a total of $34,000,000 to its American policyholders.

New Hampshire Fire

The New Hampshire Fire Insurance Company of Manchester, N. H., closed the year 1912 with total assets of $6,097,887, total liabilities of $4,391,126, and a net surplus of $1,700,767. The gains in assets and surplus, respectively, were $372,078 and $46,257, to which must be added the sum of $25,000 assigned to the company's special reserve fund. The New Hampshire's capital is $1,350,000, and its surplus security to policyholders, therefore, aggregates $3,050,762.

Notes

A bill has been introduced in the New York Legislature providing that if an action has been commenced to recover damages for a personal injury, or for death as the result of a personal injury, no settlement or adjustment of the action shall be valid unless consented to in writing by the attorney of the person bringing the suit and by the person himself, or approved by an order of the court in which the litigation occurs.

The insurance commissioners of Connecticut and Missouri have approved the reinsurance of the legal reserve business of the Hartford Life Insurance Company in the Missouri State Life Insurance Company, the commissioners of Massachusetts and Illinois also concurring.

FINANCE & TRADE

American Capital in Mexico

A little more than a billion dollars of American capital is invested in Mexico. So far as we can learn, the most complete and trustworthy statement as to American investments there is to be found in a report sent to the State Department about six months ago by the United States consul at Chihuahua, Mr. Letcher. It was based upon inquiries made by William H. Seamon, a mining engineer of long experience in Mexico, who drew the information from reports of the Mexican National Government, reports of the State Governments, directories and reports of companies, and many other sources. He classified the investments as follows:

Railway bonds	$408,926,000
Railway stocks	235,464,000
Mines	223,000,000
National bonds	52,000,000
Smelters	26,500,000
Bank deposits	22,700,000
The oil industry	15,000,000
The rubber industry	15,000,000
Factories	10,800,000
Live stock	9,000,000
Timber lands	8,100,000
Bank stocks	7,850,000
Houses and personal property	4,500,000
Insurance	4,000,000
Ranches	3,150,000
Wholesale stores	2,700,000
Retail stores	1,680,000
Professional outfits	3,600,000
Public institutions	1,200,000
Tramways and power plants	760,000
Farms	960,000
Hotels	260,000
Breweries	600,000

Small additions of a miscellaneous character brought the total up to 1,057,770,000. American investments very largely exceed those of any other foreign country. The recent annual report of the Southern Pacific Railroad Company, which has been building and operating railroads under a concession, shows that it has constructed 982 miles, out of 1506 projected.

The railways have suffered much loss, by reason of the destruction of bridges and trestles by revolutionists. Mining and smelting companies have large claims for damages, owing to attacks upon their property. In many instances it has been necessary to purchase safety from bandit revolutionists by considerable payments. Officers of American companies have been seized and held for ransom. It can easily be seen that the just claims of the industries in which American capital is invested will amount to a large sum.

Pursuit of Swindlers

We have been saying for two or three years past that the honest bankers and brokers should seek to defend themselves and to protect the public by procuring the detection and prosecution of swindling promoters. We have pointed out that the work could be done at small cost. It has been undertaken by the Post Office Department, which has sent hundreds of the swindlers to jail; but the Department attacks and prosecutes only for a fraudulent use of the mails, and, while it deserves commendation for what it has done, it has not been able to prevent the swindlers from robbing the American people of more than $100,000,000 in the last two years.

It was the intention of the new Investment Bankers' Association to establish a bureau which should pursue these thieves. The association's plans have not been completed. At present it is seeking to promote uniformity in state legislation suggested by the Kansas Blue Sky law. Bills patterned after the Kansas law have been introduced in thirty states. The association does not oppose legislation in this field, but would have it so framed that the operations of honest investment bankers will not be unduly hampered by it. Machinery for attack upon the dishonest has not yet been perfected.

There was formed last week in New York, however, an International Association of Brokers, whose principal object, the organizers say, is "to protect the public against swindlers who call themselves brokers and who prey upon the savings of the ignorant." It intends to take up the work which the Post Office Department has been doing. We await with much interest the results of this good movement. The association, we presume, will employ detectives.

President Wilson

Governor Wilson, of New Jersey, is now President Wilson, of the United States. As Governor he has proved himself progressive and efficient; we expect and shall welcome no less of him as President.

The title of President is not new to him, for he was president of Princeton University before he was Governor of New Jersey. There he had experience in administration of a very different sort; while as Governor he has had a brief experience in political administration. There he had a plain, if not easy task; his task as President will require much more tact and wisdom. He will be met and opposed, in his own party and out of it, by many men much more difficult to deal with than was Senator Smith. The country is much bigger than Essex County. He will not have a united party either for him or against him. He will doubtless have the aid of progressive Republicans, whose platform is very much his own. He has been very ready to push his policies upon the New Jersey Legislature, and he has succeeded because he was right, very much as Governor Hughes succeeded in New York, by appealing to the people. But it will not be so easy for him to do this with Congress. Neither the Senate nor the House cares to be directed by the President as to what it should do, and both President Roosevelt and President Taft have been much abused for not leaving Congress alone as the law-making power. Yet the President is also a law-making power. Under our Constitution an act past by Congress requires his consent to become a law, unless his veto is overruled by a two-thirds vote. The Constitution also imposes on him the duty to advise Congress of what legislation is required; and that involves the right to press his advice with vigor, but not to force it by threats of bribes of office. Luckily previous administrations, and notably that of President Taft, have taken much temptation of that sort out of the power of the President.

We must allow that some of President Wilson's speeches condensed in the book just issued, give us some concern. He seems to exaggerate evils which really exist, in such a way as to anticipate and even suggest attempts by misguided men to overthrow our social and industrial system by force. It may be very likely his duty to resist such violence with all the power of the army at his command. To be sure, that sort of duty usually falls upon governors of the States, yet it has sometimes required the intervention of the President, and may again. In France, a Socialist put in power has proved vigorous in maintaining internal peace, and such would be President Wilson's duty—and we believe he would do his duty.

What we feel most concern for is his relation to foreign nations and to our outlying possessions. Fortunately, he seems to be quite conservative as to the troubles in Mexico; and it may be that the troubles there will

soon come to an end. A second Diaz may prove as strong as his uncle. But we recall that it was Democratic administrations under Jefferson and Monroe and Polk that gave us Louisiana, and Florida, and Texas, and California, and we know what powerful interests would be glad to embroil us with Mexico seeking more annexation. But we fear yet more the attempt to persuade Congress to rid itself of responsibility for the regeneration of the Philippine Islands—for it is understood that the President is infected with that ungenerous and unpatriotic weakness. Yet we do not believe that the nation will consent to put into effect that portion of the Democratic platform. The free canal tolls and our relations to the Central American republics give further anxiety.

The largest problem before this country is not the tariff, nor the money trust, nor the labor conflict, great as the latter is, and involving as it does the growth of the Socialist party. We do not fear Socialism very much, for it will wear itself out usefully, not in seeking its ideal of state ownership of production, but in the amelioration of labor conditions. The really greatest moral question before the country is the treatment of ten million citizens who have more or less African blood. For this question we do not look for much more aid from a Democratic President than from a Republican one. Mr. Wilson is a Southerner by birth, with Southern sympathies, we must judge, for under his administration Princeton did not allow the admission of a single negro student. Yet we may expect that kindly patronage which the best Southerners would give to the inferior class.

We wish only well to President Wilson. We wish him as honorable an administration as that of President Taft, and with no more mistakes. We hope that his first Congress will reduce the tariff and hold down military expenditures and give us a sound financial system and solve the labor problem, if that is possible. We hope for four years of prosperity, with justice to all, including welcome to the stranger on our shores, yellow or white, and equal privilege for all, white or black.

Mr. Taft's Four Years

The man who became President four years ago brought to his work exceptional training in executive and judicial office. If service in Congress had been added, he might have been less unfortunate in his approaching encounter with the tariff. A few months earlier Mr. Roosevelt had said:

> I do not believe there can be found in the whole country a man so well fitted to be President. He is not only absolutely fearless, absolutely disinterested and upright, but he has the widest acquaintance with the nation's needs, without and within, and the broadest sympathies with all our citizens. He would be as emphatically a President of the plain people as Lincoln, yet not Lincoln himself would be freer from the least taint of demagogy, the least tendency to appeal to class hatred of any kind.

At the very beginning of Mr. Taft's term his party in Congress set out to revise the tariff. It was virtually committed to revision downward. For twelve years there had been no revision. The public, complaining of the high and rising cost of living, looked for a substantial reduction of tariff rates. We presume that Mr. Taft had not been a student of tariffs. He may not have correctly measured public opinion. In the sham revision of 1909, however, he was less at fault than the blind party leaders. He sought earnestly to improve their work, but almost completely failed. He began the work of improvement too late. There was no one to tell him how little could be done after the bill had gone to a conference committee. A few weeks later he warmly commended in public the legislation which had been the greatest political blunder in our recent history. For that blunder both he and his party have been paying ever since. The Congressional elections of 1910 followed, foreshadowed by elections in two districts where Republican majorities exceeding 10,000 were

displaced by Democratic majorities of nearly 6,000. The House was made Democratic by a majority of 66, and thereafter, thruout his term he was confronted by a divided Congress.

In a brief review of Mr. Taft's term we give so much space to this Payne-Aldrich tariff because of its continuing and disastrous effect upon the party and his own fortunes. When we have added the Ballinger incident and his unfortunate approval of the Panama Canal tolls bill, the list of important errors is complete, and there remain to be considered many admirable acts. We quote here the testimony of a partisan opponent, the leading Democratic paper of New York, which said, after the November election:

> As President Mr. Taft will leave a record of many triumphs and a single conspicuous and fatal blunder. He has been a constitutional magistrate, governing by law and not by caprice. He has given us the greatest Supreme Court since the days of Marshall and Story. He was the first President to enforce the criminal clauses of the Sherman act. He has powerfully supported the cause of arbitration. He has worked for reciprocity. He has suppressed jingoism. He has promoted civil service reform. He has had regard for economy.

There has been nothing more commendable in the record of his service than the negotiation of his memorable peace treaties and his just and patient attitude toward Mexico. It is not his fault that those great peace agreements are not now in force. They will always be associated with his name. Mr. Roosevelt denounced them. Under Mr. Taft's direction our Government has sought to aid the Central American and West Indian republics, but in two or three instances has been restrained by lack of sympathy in the Senate. He has repeatedly urged Congress so to enlarge the classified service, under the merit rules, that it shall include all the postmasters and collectors who are now appointed by the President, with the Senate's consent. These are the offices which have been and can be used in politics. He would have had all of them taken out of politics, believing that thus the public interest would be well served. And he was right. What he could do in this field without new legislation he has done, adding more than 70,000 employees to the merit lists. Among these are the 36,000 postmasters in small towns. No other President has proposed so broad an application of the principles of civil service reform or placed so many public officers and employees under the protection of the merit rules.

He negotiated a mutually beneficial reciprocity agreement with Canada. It is not in force, but it should be counted to his credit. In this he had the approval of Mr. Roosevelt, altho the latter opposed the agreement during the recent campaign. Under his direction, the Department of Justice has sought vigorously to enforce the Anti-Trust law, carrying pending suits to a final decision, and undertaking a long list of new prosecutions. He has insisted upon economy and efficiency in the public service. His conservation policy has been enlightened and progressive. During his term notable progress in the construction of the Panama Canal has been made, under efficient government, without a whisper of scandal. His many appointments to the bench have deserved and had public approval. There would have been more legislation in response to his recommendations if the House for half his term had not been controlled by the political Opposition, and still further distracted by the dissensions within his own party.

Mr. Taft has been a good President. A sane Progressive, he has sought earnestly to serve the people. He is not a politician. He has not professed or pretended to be one. Of the politician's arts he knows little or nothing. He has not always been well served by advisers. He deserved to be reëlected. His second term would have been better than his first. Going into retirement, he takes with him the good will and respect of all who have known what his aims were and what he was striving to do for the public good.

The Recall of Haywood

The referendum to the dues-paying members of the Socialist party for the recall from the National Executive Committee of William D. Haywood has been concluded. The official figures are not yet available, but it is understood that about 22,500 votes were cast against him and 11,000 in his favor. A referendum vote of the party rarely exceeds one-fourth of the membership, which is now about 130,000 persons. The total vote this time is the largest in the party's history.

Haywood was charged with opposing political action and with counseling sabotage, to do either of which is in violation of the party constitution. He refused to make any defense or explanation and in fact ignored the proceedings against him. His defenders maintained that the first charge was not proved, and they demurred to the second charge on the ground that the constitution was not explicit in the matter. His opponents asserted that he had repeatedly exprest his contempt for political action and that the constitutional clause against sabotage was as definite as the English language could make it.

Haywood was elected one of the seven members of the National Executive Committee a year ago, before his views had become widely known to the membership. The clause defining political action and forbidding the counseling of sabotage was incorporated in the constitution at the Indianapolis convention last May by a two-thirds vote and was subsequently confirmed by a three-fourths vote of the membership.

It is hardly to be supposed that there are many persons in the Socialist party who oppose political action. The recent Syndicalist and semi-anarchist agitation has, however, made a certain headway in the party; tho the vote for Haywood is largely a sympathetic and personal vote, a good deal of it is more or less frankly syndicalistic. It is believed by Socialists generally that the heavy majority against Haywood will check this agitation and that the more extreme Syndicalists will now forsake the party for the Syndicalist League.

Ministrations of Uncertainty

How far we are from achievement of political prediction comparable to the forecast that science makes of happenings in the natural world we vividly realize every time the day comes around for speeding the parting and welcoming the coming administration. The word on every lip during inauguration week is, What will he be able to do? How will the affairs of the nation prosper? What disappointments lie in store?

The hour and second of astronomical events is foretold generations ahead. The tides likewise are tabulated. The weather is charted, and the pace of the slow moving cyclonic storm is calculated. The botanical experimenter and the breeder know to a nicety what combination of qualities they can produce by taking advantage of the Mendelian law. Even the number of persons of each age class that will die of particular diseases within the next twelve months is known within a negligible margin of error to the statisticians and the actuaries.

But who can reassure us or give us timely warning of what is to befall in the world of industry, of business, of legal readjustment of the conflicting claims of life and property or in the realm of international affairs? Will the wage earners of the world and of our own nation go quietly on with their daily tasks or shall we see a partial cessation of production, a paralysis, perhaps, of communication and commerce by some great and organized strike? Will credit be maintained, or will it collapse at some unforeseen touch of mischance carrying down fortunes, and leaving the business world disorganized and deprest? Shall we hold to our policy of minding our own affairs, or will some potent suggestions pass swiftly from brain to brain until an obsessed nation clamors for intervention and the vindication of a

dignity which excited imagination sees endangered? Will the nations of Europe keep the peace or plunge into devastating war? Will the republic of China be permitted to establish and strengthen itself, or will the eager power that looks enviously upon it from the north take advantage of weakness, and provoke a conflict which may affect the civilization of the world for generations to come?

There are no answers to these questions. We make our individual guesses as the gambler bets on the throw of the dice, or the run of cards. As pessimist or as optimist we look for trouble or we count on years of tranquillity and prosperity. Some guesses are shrewder than others, but all leave the uncertainty where they found it.

Perhaps it is as well so. Who knows? Some of the zest of life might disappear if we could completely foresee. The spirit of adventure is fed by the uncertainties that time holds in store, as it is by the mysteries of unknown lands. The gambling instinct is as old as the human race, and as widespread as human enterprise. It is in a measure satisfied by this hourly necessity of taking our chances with the future. Perhaps such a necessity is a needful stimulant of nerve and courage; perhaps it acts selectively upon the mind of individuals and nations, as the physical environment does, thereby keeping mankind alert and adaptable, resolute and unafraid.

However all this may be, the fact bulks big in every individual life and in the life of each new generation. We must accommodate ourselves to it, whether we like it or not, and move on into the future expecting, whatever happens, to win something worth while in the ceaseless struggle for achievement.

Profaning the Golf-Links

Our "only living Shakespeare," Mr. G. Bernard Shaw, has remarked that nothing is ever done in this world until people are prepared to kill each other if it is not done. If this is so, then our English furies are soon to get the suffrage. While they have not yet actually put any man to death, nor committed hari-kari on themselves, as their Japanese sisters would not hesitate to do when suffering under a fancied wrong, yet they have taken the closest possible step to such sensational extremities. They have actually desecrated some golf links, by demolishing the holes in the putting greens.

This is certainly *lese majesté*. Tho Englishmen are proverbially long-suffering and slow to wrath, it is a well recognized fact that they will no more permit their sport to be interfered with than their daily "tub."

Sir Ernest Shackleton, in a speech before the Peace Society in this city the other day, felicitously illustrated the paramountcy of sport in the British scheme of things when he quoted the following poem:

> When I played golf the other day
> The German army landed.
> The English army ran away,
> The English fleet was stranded.
> It filled me with such grief and shame
> It nearly put me off my game.

We may expect therefore that the gentleman of England, aptly characterized as "always just, generally generous and never agreeable," and now goaded to the limit, will at last suffer their insufferable suffragets to have the suffrage.

Scanderbeg's Sword Needs Scanderbeg's Arm

Francisco I. Madero has run his race and gone to his last account. Not now the hour to make an estimate of his work and character. When time enough has past to permit of a right perspective, we believe that justice will be done his memory. That he was humane was proved by the fact that those who are responsible for his death were able to compass that result because in the hour of his supremacy he spared them. That he was democratic in his ideas of the proper functions and methods of government was evident from his official acts. That he understood the causes of his country's abasement

and saw clearly the road upon which her feet must be set to work out the redemption of the people is evinced by his denunciation of land monopoly and Cientifico graft. That he failed miserably in his attempt to better the lot of the common man is attested by the vivas that greeted his executioners while his bleeding body was yet warm.

The task Madero undertook was too great for his strength. The very qualities that made him estimable were at the same time the cause of his undoing. His career in the past two years brings forward once again the question whether one can fight the devil otherwise than with fire. Had he done the evils of official murder and merciless repression he might have succeeded in establishing the constitutional liberty for which he gave his life. Superficially viewed, his life and death seem to give point to the doctrine that it is well to do evil that good may come. And yet we say that it is not so. And yet we contend that in his death he has done more for the ideals that swayed him in life than a more brutal nature would have accomplisht. Pity it is that his blood was needed to fructify the glorious seed he planted. Certain it is that it will bring forth abundantly. For not Madero's weakness alone was the cause of his failure, nor even its principal cause. The unfitness for democracy of those to whom he sought to give democracy was the fundamental reason why this episode seems like an abortion, which is in reality a milestone on Mexico's laborious upward climb.

Another will arise to carry on Madero's work—one strong where he was weak; guarded where he was trustful; one who will combine dove and serpent in a formula better adapted to achieve success. But as Savonarola to Luther, so Madero to him who shall come.

An Early Money Trust

The fear of the money trust is not a new one. The alarm begun at least three quarters of a century ago. The fact appears in an incident we think never before told in print, which the present writer heard in a domestic lecture on political economy over sixty years ago. It was, we think in the thirties, that the Suffolk Bank of Boston, since absorbed in various consolidations, attempted to make itself a sort of clearing house for the banks of New England. It was a time of wild-cat banks, and bank bills were at a discount. The Suffolk Bank offered, to every country bank that would deposit with it, say, $5,000 in coin, to receive and redeem its bills at full value.

Many banks consented; others refused. Among those which refused was the South Berwick Bank of Maine, whose president was Judge William A. Hayes. But the Suffolk Bank was a money octopus. It received the bills of the recusant banks and every week sent them back to be redeemed in coin. This greatly annoyed the banks. One day the Suffolk Bank's wagon, for there were no railroads then, drove up to the door of the South Berwick bank and demanded an unusual amount of coin which the bank did not possess. To fail to pay was bankruptcy. What could be done? The president turned out two kegs of big copper cents and began slowly counting them. Meanwhile a swift horse was driven to Portsmouth for aid, and before the coppers were counted the team returned with the needed cash. But the Suffolk Bank was right, and the modern clearing house is a necessity in modern finance.

The Cube Root of Art

Since we have often sharply criticized American art of the Academy for its commonplaceness and conventionality, it is proper that we should devote a large part of this issue to the "Newest Tendencies," whose sole unity is a common revolt against the dominance of academic tradition. But life is always more interesting than art and the visitor to the International Exhibition will find it less profitable to look at the pictures than to watch the effect of the pictures on the crowd. If the lens of

a moving picture camera had been thrust thru the screen on which are hung the Cubist paintings, the film secured would have been invaluable for the study of "mob psychology." Awe, scorn, disgust, amazement, pleasure, amusement, puzzlement and adoration are some of the expressions it would have caught. The Sixty-ninth Regiment Armory in New York City is nowadays a battleground where every day from 10 a. m. to 10 p. m. rages the eternal warfare between neophilism and neophobia.

It must be conceded that in one way the modernists have won a victory. The critics, formerly so intolerant and dictatorial, are now quite completely cowed and a considerable proportion of the public has been brought into a condition where it is ready to swallow anything. Some there be who frankly express their contempt. Others anxiously inquire "Don't you suppose the whole thing is a hoax? Aren't they just trying to see what we will stand?" There is some grounds for this skepticism, for the faker and the charlatan have not been wanting from the movement. One of the pictures exhibited at the Paris salon of modern art was proved to have been painted by an ass; quite literally in this case, for a photograph was afterward produced showing the artist at work, a donkey with a brush tied to his tail, swishing alternately against a canvas tacked to the fence and a palette held conveniently near by two hilarious art students.

For the most part, however, the sincerity and earnestness, even the fanaticism, of the insurgents must be recognized. Many of them proved their ability to paint "well" before they abandoned the thorofare that leads to the Academy and began to paint—as they do. But self-sacrifice and devotion to a cause are not in any sense proofs of the worthiness of the cause. In the course of history the martyrs who have suffered for the wrong are more numerous than those who have suffered for the right. The work of these men must be judged upon its merits, not accepted at their own valuation. Marcel Duchamp may, possibly, have thought he was painting a picture of "A Nude Descending a Staircase," but it does not follow that he did. It may be, on the contrary, that the public is right in calling it "An Explosion in a Shingle Factory." The proper name of a thing is what it is called, not what it was christened. The true meaning of a picture can be determined by a simple psychological test, just as the true meaning of musical compositions has been determined in this way by Gilman, Downey and others. It is not a matter for discussion, but for experimentation. The controversy over the works of the Cubists and Curvists and the rest is after all mostly a question of the propriety of the catalog titles. Considered simply as flat painted canvas and not as representations of anything in the heavens above or the earth beneath or in the waters under the earth, they would not have aroused opposition—nor attracted attention. They are at their best much the same as the pictures we used to see in the kaleidoscope kept on the whatnot shelf in the parlor. Picabia's "Dancer at the Spring" is not half so beautiful or significant as a microscopic section of an igneous rock seen by circularly polarized light thru revolving Nicols.

The public has been brought to its present docile mood by the use of a common fallacy, perhaps the most common of fallacies, since it is constantly used as a weapon by revolutionists of all sorts. It consists in a belief that all propositions are reversible, that a good rule will work both ways. Its application in this case is that "All great art is upon its first appearance called unnatural and absurd," therefore "all art that is now called unnatural and absurd must be great." The proposition in the first place is not so indisputable as is generally believed and, when reverst, it has no validity whatsoever. Yet the formula sufficiently disguised will reduce most people to silence. There have always been those who found Raphael insipid and Botticelli grotesque, but they have rarely dared to

say so. These same people now may find Matisse ridiculous and Picasso ugly, but for the most part they are hypnotized into acquiescence.

Much of this new art is not modern in any sense except the chronological. Men were drawing this way five thousand, indeed fifty thousand years ago. We see on some of these canvases the swelled muscles of Babylonian statues, the elongated limbs and misplaced eyes of the Egyptian basreliefs, even the crude animals of the Altamira caverns. Some of these artists have obviously taken lessons from Hindu and Amerind, from Maori and Minoan. It is all right thus to hark back to primitive races and study their work sympathetically. It may well be that mankind has forgotten something in the course of the centuries in which so much has been learned. But that is no reason why we should admire the results of this resurrection of dead art unless it appeals to the modern man by intrinsic merit. These extremists, when their works are not admired, or at least not sold, complain of the times in which they live and lament that they have appeared on earth some centuries too soon. We sympathize with them in this. It is our misfortune no less than theirs. But we cannot help it and we are not willing to admit that the world is now so old that the period of its second childhood in art has arrived.

Our Mexican Peril

Thus far our procedure with Mexico has been absolutely wise and right. President Taft has done nothing more than guard our frontier from invasion by the Mexican bands, and has prevented Americans from crossing the border to engage in the war. We do not doubt that President Wilson will follow the same rule.

And yet we can see how there is danger. The telegram sent to the *New York Times* by Governor Colquitt, of Texas, is not wholly reassuring. In it he says that he believes that the United States ought to intervene for the protection of American persons and property. He says he is not satisfied that the President has sufficiently guarded the border, and he has ordered Texan militia, under his command and not under the command of the President, to proceed to the bank of the Rio Grande to give the protection that the Federal Government has not supplied. To be sure he has since recalled his troops. Now let us suppose that hot-headed Texans, with the spirit of the Alamo in their breasts, should without orders cross the river and engage with Mexican troops, or should follow across the river some Mexican marauders; or suppose the Governor of Texas should be himself a man of passion, and should listen to those who—and there are many such Americans there—have selfish interests in favor of intervention; and suppose he should take the responsibility of sending his militia across the Rio Grande, and a fight should follow, there is no telling what might happen. It might be that then we could not easily escape a war with Mexico worse than that of 1848, a war that might end with the destruction or the division of our neighbor republic. Much depends on the cool judgment of Governor Colquitt as well as on that of President Wilson.

Secretary Wilson and His Work

The passing of Secretary Wilson across the political field will not be so easily forgotten as that of many of the most notorious of our political and official leaders. His work has been of a kind that will continue for hundreds and thousands of years to remind the American people of his splendid judgment and his pertinacity of research. If in political affairs he has been a blunderer for the most part, and has been very unwise in his management of such cases as that of Dr. Wiley, it still must be said of this son of the Western soil, that he has a breadth of vision to cover the whole country, to apprehend the needs of agriculture, and to employ means adequate to essential progress.

He had predecessors, one or two, of moderate adaptation to their work, but for the most part the Commissioner of Agriculture had been pretty nearly a total failure. Suddenly James Wilson took a grip on the problem, and accomplished so much during his first appointment that he could not be spared from a second; and so it has gone on until he has been allowed to lay the foundations of a science and art adequate to a rapidly growing people. Heretofore our resources had been rapidly exhausted, and our public property squandered. But the conservation of our natural resources has now become the great national thought, on which all politics turn.

His retirement from the administration (please use that word in its full meaning, for he has been an administrator in the fullest sense of the term) of our national industrial affairs does not seem to have any connection with politics in general. It indicates a drift. We are going to dissever practical labor for the people from political party machinery more and more, and the question of length of office will become of little importance where official work is palpably and potently of substantial value to the people. The rule of Secretary Wilson has been an object lesson to show that term of office does not necessarily come under routine rule or custom. Americans will not resent a third term when the length of time is essential to the accomplishment of a great undertaking.

Great military leaders are rare, but great industrial leaders are still more rare; and so it is that those best qualified to judge, not President Wilson alone, but the leading workers in the industrial field are not easily able to point out the man who should be Secretary Wilson's successor. Such a man probably exists, but it will require extremely keen eyes on the part of the incoming President to discover him. We simply cannot have this magnificent machinery, which now girdles the globe, placed in the hands of an ambitious, conceited aspirant for office. If Secretary Wilson had not made himself conspicuous during the last campaign it might be possible to retain him still longer. He has been a bad politician but as Secretary of Agriculture he has been our ablest and wisest.

Different persons will look at these twelve years of Cabinet work from different standpoints; to us it seems incomparably the chief glory of Secretary Wilson that he undertook so to enrich our foodstuffs from all the world's storage as to make us able safely to double and redouble our population. At the same time he has kept the Department in steady walking pace with the agricultural colleges and all other scientific institutions. If he failed to accord full endorsement of Dr. Wiley, he certainly has in the field, at work not only in this country, but from the Cape of Good Hope to the mountains of Tibet and the plains of Siberia, in Japan and Borneo and in South America, everywhere on the globe, the ablest explorers, botanists and agronomists, enriching our American gardens, orchards and meadows.

We venture to say that in the hands of Secretary Wilson's employees lies the key of our ability whether to expand continuously as a people, or to become a mere mass of underfed human beings. Early in his career Secretary Wilson was met by the problem of a rapidly increasing cost of living. Our enormous Western plains had been cattle ranches for millions of beeves but were now divided up into homesteads. Lack of science in culture had exhausted a large orchard, corn, and wheat area; and in other ways it looked as if we should be short of food before the middle of the century. Mr. Wilson met the problem bluntly; and without entangling it with blackboard economics he set down as the national goal maximum crops from every tillable acre of national soil.

He was not slow to see that this would require facing the American people toward production, instead of so largely using up their vitality in manufacturing. We must, as Jefferson said, be always an agricultural

people, or we must follow the European nations on the road to exhaustion. Behind this must come evidently a new sort of national education, reaching from top to bottom of the whole system. This new system must reach every American home and every American school in its industrial training; all manned with trained intelligence. A people trained to feed themselves and care for themselves, and then have a surplus over for the rest of the globe, would be the ideal.

The Department of Agriculture now stands, not as a mere subordinate, but as the head of a great national organization, ramified everywhere; not complete in all its adjustments, but perfecting itself with each generation. It has a position distinct and unpolitical. Its definite aim and office is to train the American people to the very highest efficiency in caring for its inheritance. It should be comprehended for what it is worth, and should be fostered by further legislation. We must not exchange James Wilson at the top for some narrow-minded bigot or political enthusiast.

The Church Voice

In the Convocation of Canterbury at a late meeting four bishops spoke sharply of what they called the "church voice," cultivated in the Church of England, and, we may add, out of it; and a resolution was past which provided that in future examinations for the deaconate the candidates shall be required to show that they have had training in the cultivation of the natural voice. Many clergymen, said one bishop, have a very pleasant voice for ordinary speech, but as soon as they enter the pulpit they fall into this miserable "church voice," and in order to prevent a stifled voice he recommended the simple but effective device of sticking a pin under the chair, point upward, to prevent the head falling down on the chest.

The affected drone, or sing-song, is one of the occasions for the prejudice which the laity often have for the clergy. It would seem as if in reading Scripture or the prayers a chanting tone were carefully taught, which runs along on a single note, without intonation and with a cadence at the end of the sentence which the hearer can surely anticipate. If one is to influence a hearer he should speak, as the political speaker or the actor does, in the most natural, conversational manner possible, only with real seriousness. The fault can be corrected, as the Methodist tone of less than a hundred years ago has been corrected, and which, with its gushing utterance, has been travestied in the appeal to sinners, "Come ov-er to the Lord's-er sid-er. One foot is in the grav-er, and the other is all but-er.'

What We May Anticipate

We hope and anticipate from President Wilson a prudently progressive and a safely conservative administration. He has a magnificent chance before him, and responsibility must sober his enthusiasm and teach him both caution and hope. He is not an agitator by profession, and he will not fly the flag of revolt or prophesy revolution, altho this is very nearly what he has done in a chapter in his book *The New Freedom.* He thus warns the country:

> Nothing is done in this country as it was done twenty years ago. We are in the presence of a new organization of society. Our life has broken away from the past. The life of America is not the life that it was twenty years ago; it is not the life that it was ten years ago. We have changed our economic conditions absolutely, from top to bottom, and, with our economic society, the organization of our life. The old political formulas do not fit the present problems; they read now like documents out of a forgotten age.

Is that true? Is it not exaggerated? Is it not rhetorical? Has there been such a change in twenty or ten years? Are not the bulk of our people farmers as they were then? Is not the number of those who run their own farms increasing every year? Did we not have the great railroad systems then as now? Is the factory system a new one? President Wilson says:

There was a time when corporations played a very minor part in our business affairs, but now they play the chief part, and most men are the servants of corporations.

There was no such time ten years or twenty years ago. Would he return to the days when corporations were not and every house had its spinning wheel and loom? He is afraid to admit immigrants because they would be employed by corporations. Do not we need employees as well as employers, and does not Nature distribute brains accordingly? He continues:

The originative part of America, the part of America that makes new enterprises, that middle class, is being more and more squeezed out by the processes which we have been taught to call the processes of prosperity.

We do not see it so. If they are prosperous they are not squeezed out. It is not true of the great agricultural population, and the thousands of comfortable homes on the outskirts of every city prove that the middle class are not squeezed out but manage to find an outlet for their ambition. He proceeds to dwell on the control of government by vicious business interests and governmental favoritism, "the most obvious being the extravagant tariff." But that is an old story; it goes far back of twenty years. Woolen factories that sixty years ago paid twenty per cent dividends are now happy if they can pay six.

Thus he concludes in great alarm:

Why are we in the presence, why are we at the threshold, of a revolution? Because we are profoundly disturbed by the influences which we see reigning in the determination of our public life and our public policy. Don't you know that some man with eloquent tongue, without conscience, who did not care for the nation, could put this whole country into a flame? Don't you know that this country, from one end to another, believes that something is wrong? What an opportunity it would be for some man without conscience to spring up and say: "This is the way. Follow me!"—and lead in paths of destruction!

No, we know no such thing. The heart of our country is calm and right. It is not ready for destructive revolution. It would listen to no such agitator. Such an attempt would be crushed very shortly. There are evils connected with our industrial system, and they are being relieved year by year; but the control of certain forms of industry by great corporations is necessary and right, and anybody can get a share in them. We cannot go back to the ancient system of general small competitive producers. Yet there are still many such. The department stores have not squeezed out the small groceries and dry goods stores, as every street shows. Governor Wilson's cry of alarm was not justified, and it will not be mischievous, for there is not tinder enough to set the country aflame.

In Brief

Not yet are we going to rejoice unreservedly over the courage with which Congress last week past over the President's veto the act forbidding interstate commerce in intoxicating liquors into States which forbid the use or sale of such liquors. The law is intended to give protection to "dry" States against the importing of liquors from other States. We suspect that some voted for it, believing the act would be declared unconstitutional and ineffective. The President who vetoed it and his Attorney General are good lawyers and they declare that it is unconstitutional because it allows the States to regulate interstate commerce. The Supreme Court must decide it, and if they can decide it against the President the prohibition States will have great reason to rejoice, but that result is by no means sure.

The House has defeated the bill for the construction of two big battleships and has consented to provide for only one. That is just as well, for all the oratory of patriotism, yet we do not allow that it was the sentiment of peace which reduced the cost for war. It was the feeling that some reduction must be made in the enormous appropriations for public buildings everywhere; and rather than yield their local post offices they cut off a battleship. They clung to their pork. They could not give up a sparerib.

The *Southwestern Christian Advocate*, of New Orleans, is the official organ there of the great Methodist Church, North, and is edited by a negro. Under the title, "Who Cares?" it gives a page of noble indignation

to the silence and tolerance of people on the lynching, and terrorism following, under which negroes live in the rural districts of that State. There are those who do care, who regard it as the greatest disgrace of our country. And there are those who speak. One of those who lynched an innocent man in Houston, Miss., heard a sermon the next Sunday, and went home and shot himself dead, and left a note saying, "I am a murderer."

Governor Blease has broken out again in a letter in which he says he expects to go to the Senate and there fight the education of the negro; and this is the reason:

> God Almighty never intended that he should be educated, and the man who attempts to do what God Almighty never intended should be done will be a failure. God made that man to be your servant. The negro was meant to be a hewer of wood and a drawer of water. If He had intended him to be your equal He would have made him white like you and put a bone in his nose.

But how about those who are pretty well whitened out, and have had a bone put in their noses?

Mr. Roosevelt, who has hitherto refused to join in any combination with another political party, and particularly with the Republicans, now consents to a coalition of all political parties against Tammany in the New York city election. That is a step in advance towards reason, and would nominate and probably elect Mr. Whitman as Mayor; and it may foreshadow a later reunion of the two wings of the Republican party, which is what ought to be the aim of both.

Germany increases heavily the permanent peace footing of her army. Then Austria follows, strengthening so much the military power of the Dreibund in case of war. What, then, should France do but put new burdens of training on her citizen soldiers; and now Russia does the same for support of the dual alliance. Thus the hateful rivalry advances in both army and navy, and the people pay the piper. They call it insurance against war.

The fact that during the week we have once more no news of serious fighting in the war against Turkey, is evidence that peace is probable by the complete submission of Turkey to the will of the powers. The most we have is reports of the presentation to Turkey from the allies of conditions of peace, including the cession of the besieged fortresses and an indemnity of $300,000,000.

What a scare the English have had about a German dirigible flying over the tight little island on dark nights! Did they not see its light, as if a secret airship on a secret expedition would carry a light? Was it Venus that they saw? Probably, and they imagined they saw it move—

> And shall our planet fly?
> Then forty million British men will know the reason why.

We had heard very little of the Nicaragua treaty until news was received that it had been approved by the Nicaraguan National Assembly. It deserves the approval of our Senate. It gives the United States the sole right to construct an inter-oceanic canal, and it gives us a valuable naval base, and at the moderate cost of $3,000,000. That sort of "entangling alliance" is not bad.

Mr. J. Pierpont Morgan is to be praised for using his wealth for purposes of scholarship. Lord Amherst, of Hackney, was a great collector of Egyptian manuscripts and monuments, and now his whole collection has come to Mr. Morgan's library in this city, and will be properly publisht. We regret the news of his illness in Egypt, where he is carrying on excavation.

Be it noticed that the forger Grimmell, who was released from a New York prison two years ago after a surgical operation on his skull which it was hoped would cure his criminal tendencies, has been convicted of burglary and sent to prison again for life. Thus passes a kindly dream that crime is a disease and not a sin.

The oddest application of the principles that interstate commerce under the Constitution must not be interfered with appears in the excellent bill just past which protects migratory birds in their passage to and from the South. Don't they cross State lines? Can't they then have Federal protection?

The British reply to Secretary Knox's note defending the unequal Canal tolls adds nothing and needed to add nothing to the argument against them. It is easy to meet Mr. Knox's assertion that Great Britain should wait till tolls have actually been remitted.

The Duke of Norfolk and the other Catholics in the House of Lords voted against home rule for Ireland. Were they afraid that the Irish Catholics would oppress the Protestants? Are they with the Orangemen of Ulster?

We are sorry for Philadelphia. Of the magnates charged by the Pujo Committee with being associates of the Money Trust with its center in New York, Chicago has three, Boston five, and poor Philadelphia not one.

His All-Round Excellency, the College President

What Is Required of the Executive of an American Institution of Higher Education

By Charles Whiting Williams

[That the president of a university should within three years become President of the United States is not surprising when we consider the character of administrative ability demanded of the head of such an institution. Mr. Williams, having long served as assistant to President King of Oberlin, and in his travels become familiar with the workings of the educational machinery in all parts of the country, is able to illustrate his points with pertinent and amusing anecdotes.—EDITOR.]

No wonder a great party staked its chances of a diploma from the electoral college and a long delayed return to the White House on an ex-college president—and won! The number, size, quality and variety—in more academic language, the multitude, magnitude, essential characteristics and heterogeneousness—of the duties loaded on the modern college executive are enough to fit him to handle with ease practically any job of "presidenting" the country can furnish.

A noted professor has set down the following ingredients as necessary in the successful college executive: "An inconceivable breadth of culture and of variegated scholastic interests, mingled in due proportion with the wisdom of a Solomon, the self-sacrifice of an apostle and the temper of an angel." Unless both history and memory deceive, we have had national executives who were not equipt with quite all of these qualities; but without a doubt we have never yet had one who did not at one time and another feel the need of all of them.

In the White House President Wilson meets with a Cabinet all of whose members sit about the table on his personal invitation—and from it they can, likewise, be "invited" to withdraw. Imagine the troubles—also the training in tact and diplomacy—of a President compelled to look happy while dealing with a Cabinet bequeathed him by a whole series of previous administrations! Yet the able director of a university's destinies must endeavor to unite the divergent interests and enthusiasms, and, if possible, keep the friendly coöperation and respect, of faculties and committees representing every conceivable degree of variation of age, experience, training and viewpoint. These personal relations require the successful president "both to give pain and endure it." Failure to give it may shortly spell an inefficient faculty; failure to endure it may mean a disrupted one. Insert "party" for "faculty" in both instances and the suitableness of the same rule to politics is plain. But no political party ever contained in proportion to its size anything like so many different kinds of people as a university teaching force. Make a brave attempt to imagine how differently matters are sure to be looked at—and gone at—by various professors of, say, zoology, Sanskrit, embryology, homiletics, farm fertilizers, pharmacology, railway engineering, rabbinical philosophy and swine husbandry!

Of many educational institutions, the charters and by-laws, like the Constitution, are imperfectly adapted to modern conditions and leave a good deal of leeway for that particular interpretation which best suits the chief officer. If his personal equation is that of an Andrew Johnson he is likely to take every prerogative in sight and try to absorb pretty nearly the whole organization into himself. On the other hand, if he likes detail and is not greatly interested in administrative organiza-

tion he may find himself trying single-handed to care for everything.

"Yes," said a professor not long ago in one of our greatest universities, whose executive was a famous scholar with rather too much liking for small matters, "Yes, I saw that there were no towels in the university guest chamber when I installed our visitor, but what could I do, with the president out of town?"

With the one it is excess of ability and desire to command, with the other a lack of it, that stretches these men into the proportions of the shipwrecked sailor whom fate had made

At once a cook and a captain bold;
And the mate of the Nancy brig,
And a bos'un tight and a midshipmite
And the crew of the captain's gig.

There comes immense pressure in this same direction from outside. During the course of the year there are sure to be several letters asking the president's personal service in this wise:

MY DEAR PRESIDENT BLANKER: My darling boy will arrive on the evening train of the 23d. I do hope you will be able to meet him, as he will find it all very strange, having never been away from home before.

MRS. FONDEMOTHER.

Even closer personal attention—and still more courtesy and consideration—is required when some of the writers of these epistles come to the president's office for assurance equal to their fears. Said one of them to a well-known college head:

"How can I be certain my son will not be harmed by his years here? Tell me!"

"Madam," he replied with a shadow of a twinkle, "you need not be uneasy. We guarantee satisfaction or we return the boy!"

In some cases the by-laws are themselves to blame. Unchanged from simple beginnings, they specifically require the president himself to fulfil all the duties of captain, cook and crew, just as the early ordinance of Philadelphia prescribed that the Mayor himself personally inspect the town pump and the weighing of the baker's loaves. But whether regulated by charters antique or charters modern, few if any executive offices except those at Washington furnish so many different kinds of nuts to crack as a great university. Of the kernels of practically all of these, furthermore, the president is expected to taste or partake more fully than is common elsewhere outside of Washington. Usually he is automatically a member, if not the chairman, of all the various departmental faculties and of about all the important committees. These make almost every day an expanse of meetings and more meetings: at nine to discuss new teaching and scholarship methods; at ten to inspect the plans of three new buildings or the credentials of thirty new teachers; at eleven with the agricultural or medical or engineering faculty for determining upon a larger site or more elastic admission requirements. Later a long session in an attempt to stretch a million income to meet the pressing needs of the various departments totaling a million and a quarter, followed, doubtless, by another to discover ways and means of increasing the endowment, etc.

In between such meetings must be distributed an equally varied assortment of conferences with officers, teachers, and—tho in instances too few—students. In spite of an amazingly close attention to details by the democratic tho cumbrous method of committees, big mistakes occasionally occur—just as elsewhere, including the White House. One university officer some years ago misread the figures for the grading of the campus and as a result misspent $50,000 for teams and men. Another once constructed a dormitory without noticing that the stairs had to be entered from the cellar. Whatever and whoever their cause, such blunders are likely to bring—in addition to experience—much unhappiness, some blame, and a gray hair or two to the hard-working man at the top.

To all these duties should be added a varying amount of money raising, faculty recruiting, teaching, stu-

dent disciplining, etc. If that were the complete filling of the college executive's day it would still be enough to make any imaginable field of "execution" look easy and attractive. But that is only a part of it; for just here Mr. American Public steps in. He is, of course, the backer as well as the beneficiary of the whole higher educational enterprise and he feels that it would be a shame not to get the benefit of the president's discernment on a thousand and one matters, little and big. In the words of one who has perhaps the greatest reason to know:

"A college president will hear, during the course of a year, from half the country's wise men and all its lunatics."

"Will you be so good," perhaps one of the former writes, "as to let me have at your earliest convenience your careful judgment of the enclosed manuscript?" 200 typewritten pages.

"May I ask you to suggest," inquires another, "a tabulated list of the 450 books most suitable for the reading of one who goes as a teacher to the Philippines?"

"Supposing," said an unknown woman of apparent maturity, poise and dignity, to a noted and most trustworthy chancellor, "supposing you were I, and had a friend with whom Fate and thoughtlessness had dealt thus and so, what advice would you counsel me to give her?"

The considerate listener did his best to point a way out of the hypothetical dilemma. But both his failure to do so and the actual identity of the supposed "friend" were made apparent a few days later when the distrest interviewer herself became a suicide.

Many offices are not open to such visitors, and many return the manuscripts and other inquiries with a printed "—greatly regrets that the press of other duties prevents," etc. Yet the marvel is the number of those that do give, in greater or less degree, the desired criticism, suggestion, sympathy or other coöperation. Practically without exception, all the college heads, too, respond readily to the hundreds of public needs which are constantly calling for speeches or essays here and presidings there, counselings north and commissionings south, lunchings east and dinings west, with societies, clubs, commissions, committees, boards, and associations, local, county, state, national, and international—for purposes scientific, philosophical, economic, civic, social, esthetic, literary, moral, religious, etc.

"There is one society which I should like to see organized," said a popular and overworked educational leader. "That would be the Society for the Prevention of Further Organizations."

"Fully three-fourths of my daily mail," testifies one, "has nothing to do with my institution, tho I suppose it is all more or less connected with education, if you will make your definition broad enough."

In answering the one-quarter and carrying on the burdens it involves, he is often overworked, and for it he is usually paid little enough. In attending to the other three-quarters he is still further strained, and for it he receives no salary at all. But he does get, it is to be noted, an acquaintance with just about everything people are thinking about in the whole country along every line—not a bad equipment for public office in a government supposed to be representative.

It is not surprising that, long previous to November 5, 1912, this general utility man has frequently been promoted from the campus to the state capital or the foreign court, there to use his well-nigh universal experience with people and things. President Angell, of the University of Michigan, at Constantinople and elsewhere; President Andrew D. White, of Cornell, at Berlin; and now his successor, President Schurman, at Athens—these and many others have in this way been honored and have honored us.

At the same time it is not surprising that under the pressure of such

varied demands not a few break down in health. Some others, it must be admitted, suffer breakdowns of a subtler sort.

"President So-and-so is a phenomenon," said a keen observer recently. "I have seen many men lose their fineness of grain after becoming college heads. He seems as fine a gentleman as ever."

The public's grading of White University as better than Gray because of more numerous students is near the root of this matter of such breakdowns. The apparently indispensable large investment, which, in turn, depends unfortunately upon dollars and cents, thus causing that love which may be the root of many evils for institutions as well as men.

But don't be hasty with those stones! Suppose you were president of Commonlot College. Then suppose your athletic director urged you to stop playing "ringers" on the teams, and you couldn't do that without offending an alumnus who was furnishing not only the "ringers" but also about $100,000 worth of new buildings each year. What would you do? In some schools it is a question not of new buildings, nor of growth of any kind, but of bare running expenses. At a well known tho small college, one of the students not long ago told his father, a faculty member, that the treasurer had threatened to close classes to him unless tuition was paid immediately.

"Tell him," the professor said, "that I will be most happy to pay it the moment he is able to pay me my salary for the past three months."

It is hardly too much to say that the constant pressure for money in such circumstances almost unsettles the mind of some of those presidents who must carry the burden. One such, in charge of a great city university, is reported to have called on a wealthy widow to make an appeal for a large gift less than four hours after her husband's funeral.

"I told you never to enter that door again without my permission!" roared a certain rich man whose openness of heart and purse had been abused by one of those rightly called a "college beggar."

"Yes, I know," was the undaunted reply, "and you just now called 'come in' as I knocked!"

A considerate recipient of a considerate request from a noted executive wrote: "I don't care a rap about the need you mention, but I enclose $100, because any letter written by a person of your standing should never be worth less than that."

Less considerate—also less noted—was the executive who, rumor says, took his hat and his courage in his hand—leaving, notice, his "fineness of grain" at the door—and slyly penetrated the cordon of clerks and butlers into the study and the presence of a well known philanthropist, to leave later with a large conditional pledge! He is no doubt one—not the only one, by any means—of those college builders who have grown gray raising great sums to meet the conditions of similar offers and who accordingly delight to roll beneath the tongue of their humor the story told of that same philanthropist. He is reported to have dreamed that he jauntily presented himself and his credentials to Saint Peter. To his amazement he was met thusly:

"You cannot enter these gates without a halo. Here is a quarter of one; I will admit you when you have succeeded in raising the other three-quarters elsewhere!"

There has been crying need of the recent efforts to spread the dollar pressure over several officers instead of one, and otherwise to lessen the overbreadth and overweight of the burdens that cause these breakdowns of physical and sometimes of moral fiber. One well known professor has suggested that faculties be given the power of the recall of presidents and a number of others have recently seriously proposed the abolition of the president altogether and the distribution of his function and powers among the teachers. It is hard to see how matters would be cared for on that basis, for even now most faculty

members are surprisingly little interested in administrative details not connected with their teaching fields.

A considerable amount of distribution is doubtless needed for the protection of the president if for no other reason, and is pretty surely on the way. It will at least greatly lessen the present difficulty of finding men to head the colleges; for it will create a sort of training school for the working up and trying out of executive material in the staff and the faculty, making it no longer necessary to risk the welfare of an institution upon the chance that a noted mathematician will prove a successful adder of institutional prestige.

This distribution, while it may possibly lessen the White House chances of a few, will increase them for the large number among whom it will distribute the advantage of administrative experience and training. In this way it will perhaps make the campus even more than ever the back yard of the nation's executive mansion. For not only college faculties and trustee boards, but also the American people as a whole, are seeing that to be a great executive—whether in the quadrangle, the counting-room, the city hall, the state or the national capital—requires not only a strong, all-round, and far-seeing personality, but also that this personality be able to set itself into highly effectual motion. The successful executive personality, that is, is not the one which works single-handed, because of inability to obtain coöperation or because of the disdain of it. Instead, it is the one which makes wise and cogent use of organization and administration in an endeavor to put into actuality—whether in the college or the commonwealth—the best vision of the whole governing body and of all the persons and interests which that governing body is expected to represent.

President Garfield made his way to the White House across the campus of Hiram College, where he was president for three years before entering politics. But it is particularly to be noted that the first person to clear this pathway between the two executive mansions of nation and college was no less distinquished a person than Thomas Jefferson. After he had directed the young republic as President for two terms he continued ably to serve it as a university head. In both capacities he showed himself probably the most far-seeing and at the same time the most all-round statesman this country has ever known. One of his last requests was that on his epitaph there should be added to the words "Author of the Declaration of Independence" the further title of which he was almost equally proud:

> Founder (and Rector) of the University of Virginia.

It looks like a good omen, doesn't it? that the same pathway has again been opened up and put in good order by the votes of the American people for the use of the present leader of the party founded by the wide viewed and far viewed author, President and rector.

Oberlin, Ohio.

Retrospection

By Ralph M. Thomson

Unto my heart said dissonant Despair:
"Give up—and die!"
Then headstrong Hope, who mocks at whining Care,
Asked: "Comrade, why?"

The soul of me, perhaps, could never say
How such was done;
But on that long to be remembered day,
I fought—and won!

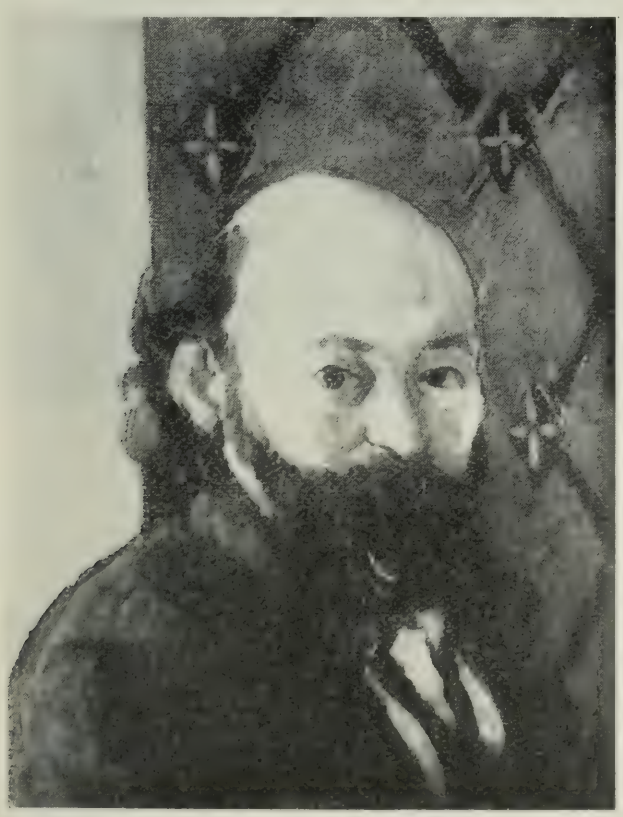
Newest Tendencies in Art

By Frank Jewett Mather, Jr.

[This article has special interest just now, in view of popular interest taken in the current Exhibition of Modern Art, held in a New York armory, by the Association of American Painters and Sculptors. Our illustrations are chosen from among the canvases shown there; and our aim is to reproduce representative compositions—not sensational examples—of the work which Mr. Mather uses as his text. "Whatever you think of this show," commented one layman at the opening of the Exhibition, "our art can never be quite the same again!" Mr. Mather is a professor of the History of Art in Princeton University. He has a deserved reputation for sanity without pedantry, and is one of the few art critics we know who writes common sense. He is the author of *The Collectors* and other charming books, including a study of Homer Martin.—EDITOR.]

There was an old monk of Siberia
Who said, life grows dreary and drearier;
So he burst from his cell;
And emitting a yell,
He ran off with the Mother Superior.



This familiar epigram may have its stylistic defects, but it has the merit of explaining the surprising and unedifying adventure of its hero, and modern art is staggering boisterously along untrodden paths because it has found the old high road intolerably dull. Now to burst from your cell is praiseworthy or not, somewhat according to the sort of routine you are escaping, and, even more, according to the use you make of your liberty. It may, for example, be conceded that much recent art has been appalling dull without admitting that the remedy for such dulness is the vivacity of Henri Matisse. Convent life in the case before us was evidently tedious, but the boldly won Mother Superior may also have proved a dreary or violent companion, and the second state of the enfranchised monk worse than the first.

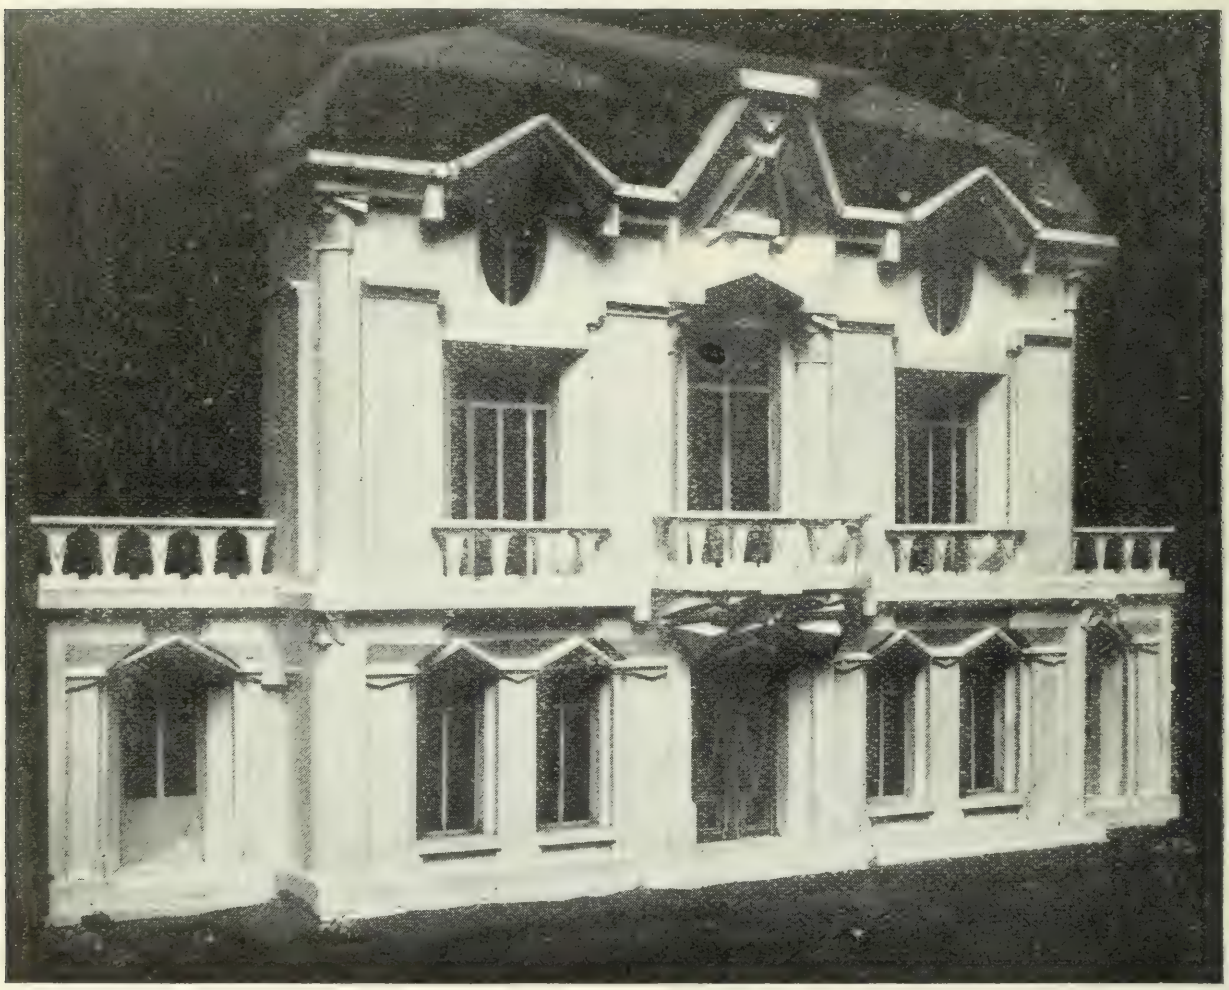
CRUEL TREATMENT BY A CUBIST
A Portrait Bust by Pablo Picasso (Spaniard).

To judge either the principles or the practice of the newest movements, Post-Impressionism, Cubism and Futurism, we must know something about the aims and procedures of art generally. An artist is merely a gifted man possessed of a strong and fine emotion which he is impelled to express in his chosen medium and thus communicate to other like feeling men. This strong and fine emotion, of course, grows out of his own experience—in the case of a painter out of what he has actually seen—tho, of course, such experience may be variously recombined and transformed in memory and imagination. A painter is primarily a man of intense eye, finding in its observations his keenest enjoyments, and possessing skill of hand to express his emotionalized vision in paint on a flat surface. But the emotionalized vision which he symbolizes in the visible picture may be of various sort. In all classic painting, meaning by the term

merely that which seems permanently to have won the admiration of cultured people, the vision is usually composite, reflective, intellectual. The artist puts into his picture more than he ever saw or felt at any particular moment. All of his knowledge, of his repeated strenuous observation, of his affection and admiration, may be in some little pencil sketch by Ingres, representing merely a pretty woman. The work, that is, contains more of the artist's personality than could be aroused and conveyed in a brief moment of intense seeing and swift execution. Thus a classic painting is never true to anything seen and felt by anybody at a particular place and instant. It derives from a sudden emotion, but that emotion is progressively enriched and somewhat transformed in frequent repetition and revision. So in the case of a great artist who grasps his picture from the first. In the case of a weak artist, whose first vision and emotion are feeble and uncertain, revision and repetition mean muddling together several bad pictures on the same canvas.

AS HE SEES HIMSELF

Paul Cézanne, who paints this portrait of himself, was formerly the "last word" of the radical in art, but now is all but a back number with those who run with Matisse and his fellows.



ALMOST A CLASSIC

Cézanne's painting of "A Peasant Woman with a Rosary" is one of his best achievements, and is distinguisht by less of eccentricity than the work of his successors.

Much nineteenth century art represents precisely such wobbling.

Gradually thru the nineteenth century the tacit assumption that a work of art is a composite, a compilation from many experiences, was sharply challenged. It was asked if such compilation, being largely based on memories, did not involve falsification? Close analytical study of momentary appearances easily proved what might have been assumed from the outset, that almost all old pictures were untrue to any particular impression of reality. As these particular fleeting impressions were studied their fascination increased. Delacroix reveled in the purple tinge of shadows. Turner set down the keenest and most tenuous hues of the fleeting glory of sunset. Manet was to frame both the doctrine and the practice of Impressionism. The word, which is frequently misunderstood, means simply that the artist must come fresh to each observation, eliminating from his impression everything he knows. A single, intense moment of sight, and its swift unmodified record—such are the law

and gospel of Impressionism. Or more familiarly, the ideal Impressionist would be a man without a memory seeing the world from an express train that never repeated its route, and setting down his more vivid impressions during occasional stops. Edouard Manet held that any subject of a painting must be and is seen as so many reflecting surfaces which are interpreted in the brain as so many colored areas. To see these areas accurately is the whole of artistic vision, to find tolerable equivalents for these colored areas in patches of paint on the canvas, the whole of good artistic technique. In short, nothing beyond the facts of a particular experience of sight was to have any significance for art. Of course, the absolute isolation of any visual experience is impossible, and obviously the mere mineral and vegetable stains of the paint box afford no complete equivalent for the brighter lights of nature. But with these reservations, Manet and his Impressionist disciples ever since have done pictures tingling with the actuality of the moment, free from reverence for nature or man, devoid of all those humane qualities of classic art which reside in the memory of the race and the individual. It was somewhat but not quite in the spirit of Impressionism that Whistler used to declare that his finest portrait was merely an arrangement in grays, the fact that the subject was his lovely and venerable mother being artistically negligible.

A CUBIST HOUSE

We should expect a building of a more original type to be designed for the unconventional people of the Post-Impressionist portraits, but it is not so safe to take liberties with brick and stone as it is on canvas—with anatomical structure.

And this word arrangement calls up a mood that has grown powerfully alongside of Impressionism, namely, preferential vision—the artist's right to see in nature only what interests

him, neglecting the rest. Something of this freedom there has always been in the art of painting; the mere fact that the color scheme of every painter is individual implies such liberty. But in the second half of the nineteenth century this liberty, like many others, was to be prest to the extreme. Whistler's symphonic color schemes are famous; nature merely suggests them. But that sunstruck phase of art represented by Claude Monet and his

THE POTATO-DIGGERS
From the painting by Vincent Van Gogh (Hollander).

followers is the most interesting expression of preferential vision. Monet is a notable specialist in sunlit air. Finding that the fullest expression of irradiated atmosphere is incompatible with explicit representation of the reflecting objects, he lets the objects go or reduces them to penumbral vagueness. Incidentally the Luminists invented a new method to suggest the vibrancy of light. Black is discarded because it is inert, and the painting is made by laying strokes of bright color together, leaving their mixture to the spectator's eye. This art, being concentrated on the problem of light and air, is careless about subjects and composition. Any object serves the Luminist's end so long as it absorbs or reflects light interestingly.

After the Luminism of Monet, Sisley, and Pisarro, younger painters tried to organize schematically the laying of color on the canvas. Where the Luminists had laid the strokes with some regard to the form of the object, getting the desired optical mixture by instinct or experiment, the Neo-Impressionists, as the new men were soon to be called, practiced a perfectly uniform dot, or blob, and studied scientifically the results of color juxtaposition. Thus technique became a shade more unnatural, and Luminism endeavored to assume the pretensions of a science.

Meanwhile the vagaries of pref-

A NUDE DESCENDING A STAIRCASE

It is with trepidation that we present a picture of this title to readers of THE INDEPENDENT, but anyone who finds his morals impaired by contemplation of this picture, however intent, may bring suit for damages against the artist, Marcel Duchamp.

erential vision increased. After the decorative playfulness of Monticelli, a fantastic and charming genius, there followed men who preferentially saw only purple in the world, those who favored black and gray. Some, like Carrière and Mathys Maris, chose to see the world and men veiled in pearly mist. Guillaumin and Van Gogh saw landscape as fiercely palpitating color. Paul Gauguin sought out the harshest contrasts to express his vision of barbaric life. Cézanne accepted generally the broken primary colors of the Luminists, while striving to get with this difficult and inadequate technique the maximum effect of solidity and mass. In short, for fifty years painting became constantly more highly specialized, further away from average human concerns, more unlike both nature itself, as perceived by the ordinary man, and even more unlike the world of the classical painters which the average man had been trained into accepting as natural. Evidently the way was being prepared for that complete breach with nature which is the avowed program of the latest painting. But before we turn to the Post-Impressionists and the rest it may be well to remind ourselves that the great painters of the last century, Corot, Constable, Millet, Rousseau, Puvis, stand singularly apart from this progress. They are frank traditionalists, learning much from the past, merely refining upon the usual procedures of classic painting. And it should be further remarked that the movement we have been observing swings from a social conception of art, under which the artist and the ordinary man agree in a way of observing and enjoying nature, to a highly individualistic ideal under which the artist is a law unto himself. More concretely, the classic ideal places value in the whole personality of the artist, including his trials and errors, memories and thoughts, while the Impressionistic ideal sets value in his particular impulses and their expression. His duty is to keep these impulses apart; to gratify them to the full; to keep memory out because it dulls the edge of instant sensation.

But at least all individualistic doctrines till very lately admitted a kind of authority in nature. Suppose my isolated mood to be the only artistic motive or value, at least it is nature or some aspect of nature by which my mood is evoked. It is the distinction of Post-Impressionism to have retained the theory of the isolated ecstatic state, but it is now supposed to be complete within the personality itself. Nature does not come in at all, being merely a disturber of the authentic inward emotion. The Post-Impressionist boils within and overflows upon the canvas without any aid from outside, just as a sufficiently enterprising and self-centered silk worm might convert himself into fishing gut by raveling out his own insides. Such is the doctrine of Matisse and his followers. "We express ourselves immediately in paint," is their cry; "and our forms and colors are not those of nature, but those of our own inner emotions." In such a view lies either lamentable self-deception or utter charlatanry. All experiences in a life are knit together. Memory cannot wholly be inhibited. Psychologically there is no such thing as this isolated emotion in the void. So the Post-Impressionist is forced to simulate it. What he actually does is merely to search the remoter, odder, more unlikely parts of his experience of nature, and render them with a coarseness and vehemence which is to be read as spontaneity. You may see just what emotional immediacy comes to in the Matisse portrait here reproduced. We have wilful if powerful distortions, a childish symbolism, fairly appalling ugliness. I sometimes wish the oversubtle and world-wearied esthetes who welcome the shock such a work undoubtedly produces could bring to their appreciation of art the common sense they use in their ordinary living. So far as Post-Impressionism rests on a desperate struggle for originality and a false theory of the emotions it is a negligible eccentricity which will soon run its course. Yet no such revolution is ut-

terly vain. This one represents an honest and justifiable disgust with the tameness and nullity of much academic painting. No one can be more aware of the extent and oppression of this standardized dulness than a professional critic of modern art. But if it comes to choosing between a quiet bore to whom eyes and ears may be shut and a blatant guest who insists on a hearing, a sensible man may well prefer the bore. Between a steady course of being bored academically or Post-Impressionistically I should unhesitatingly choose the former. Since Post-Impressionism is incessantly experimental, and insists on the most succinct methods, some technical improvements may well ensue, if almost by chance. A franker use of color, certain simple formulas for mass, a bolder decorative sense—these are hints that many of our well trained painters are quietly taking from the Post-Impressionists. Yet I feel that all such gains in detail come to very little indeed so long as art is unguided by any sound social tradition and left the prey of boisterous and undisciplined personalities. And I should perhaps add that the element of sincerity, which one may admit in the leaders of the movement, is signally lacking in the rank and file. If emotion be individual and unique, it is odd indeed that so many youngsters are venting themselves in the precise cacography and cocochromy of Henri Matisse. Much of the queerness of the work means merely changing old models for new, going to barbaric instead of to classic examples. Of course the view is possible that Post-Impressionism is merely the harbinger of universal anarchy. But since art movements usually have followed their social causes rather tardily, it seems more reasonable to believe that we have to do, not with impending revolution, but merely with a particular and transient form of eccentricity which began twenty-five years ago in literature with the Symbolists.

I have dwelt upon Post-Impressionism somewhat at length because it grows directly out of the individualizing tendencies of the nineteenth century. It is a gaudy and ill-favored plant, but at least it has roots. So much can hardly be said for Cubism and Futurism, which are more or less hoaxes. The single ascertainable notion behind Cubism is that finer effects, particularly of mass, may be attained by choosing a single and uniform unit of expression, preferably the cube. Thus a picture becomes virtually a construction in solid geometry. The practice is an extension of the theory of the uniform touch which we have already noted as the rule among Neo-Impressionists. Thus a Cubist portrait resembles a pile of overlapping slabs, or a somewhat disorganized kaleidoscopic image. After some delay the cubes will organize themselves into vague masks which take their place in depth as in a basaltic cave. An intent observer of a pile of bricks or of the shattered face of a cliff might get similar illusions of faces and of depth. In fact, the whole

IN MADRAS RED

This Matisserie is one of the canvases which expresses with a vengeance "the art of men who have had the courage to shun with scorn effete sentiment, the pretty as well as the petty, . . . the cheap confectionery that dealers so easily sell." But Matisse has evidently scorned Nature as well as "effete sentiment."

A RED VISION OF TERPSICHORE

This painting of "Dancers at the Spring," by Francis Picabia, seemingly tries to convey in color and form a figure of speech rather than an actuality.

theory seems to be based on those simple forms in text books of psychology which, according to the attention, come forward or go back. To this the Cubists add decorative color. I believe Picabia refuses to be classed with the Cubists. At least his polyhedrons in the picture of the Dance, executed largely in tints of scarlet, place him among the geometers. It is conceivable that an occasional Cubist, like Picasso, their leader, may believe in this geometrical mode of expression, but in the main this perversely ingenious work seems a mere hoax of mechanical draftsmen.

The exact doctrines of Futurism I do not pretend to understand; in fact the movement is perhaps too uncompromisingly revolutionary to admit of doctrines. But I do know that the movement was worked up about six years ago by a shrewd young Milanese journalist, who skilfully used the most modern methods of self-advertisement. In a general way Signor Marinetti advised the razing of old Venice and the finding of beauty in the factory chimneys, which are beginning to rise from the lagoon. Then the Campanile fell, and in spite of the Futurists was rëerected. This group, which is unfortunately not represented in the Armory exhibition, shows a common tendency to resolve the isolated action, which has hitherto been the subject of art, into penumbral suggestions of what went before or followed. This is said to be a philosophic assertion of the fact

that human experience is a continuous flux and not to be divided into separate states. The pictures give much the effect of a fever delirium or of a kaleidoscopic image, the units of which are detached portions of the human frame. Often the Futurists employ geometrical procedures akin to those of the Cubists. Such an effect we see here pictured in Duchamp's Nude going down stairs. It should be noted that his procedure, tho he is not connected with the Futurist group, combines something of their ideas with those of Cubism. The picture is ingeniously constructed. One seems to see the shifting edges of a gigantic pack of cards spread open. Conceivably if one descended a circular staircase until dazed the steps might form this confusing image before his bewildered eyes. Some such thing I take to be the artistic theme of the picture. Poe might have got a thrilling paragraph out of the motive of a staircase curling away endlessly before faltering feet.

And here, perhaps, lies the fallacy of the whole recent movement—so far as it is at all sincere. In the desperate research of novelty, themes that might serve a minor purpose in literature are promoted to major use in the art of painting. An exact description of a distorted and toadlike nude by Matisse would perhaps not offend the mind; the picture does offend the eye. Conceivably Picabia's Dance could successfully be put into words, as an extravaganza, the red limbs of the dancer being likened to incandescent ingots. Such a metaphor would make an appeal to the imagination that the picture lacks. In short, so far as Post-Impressionism and Cubism are not mere sham they seem to me an insidious rebirth of the old fallacy of the literary picture. Only the models have changed. The Mid-Victorian literary picture was nourished on harmless anecdote, the Post-Impressionist or Cubist picture is spawned from the morbid intimations of symbolistic poetry and distorted Bergsonian philosophy. In fact, the unwholesomeness of the new pictures is their most striking and immediate condemnation. Where the critic notes a forced and hectic mixing of pictorial and literary values, the layman may well dismiss on moral grounds an art that lives in the miasma of morbid hallucination or sterile experimentation, and denies in the name of individualism values which are those of society and of life itself.

Princeton, N. J.

The Exhibition

By Harry Kemp

I cannot shake away their wild control;
Their colors still go roaring thru my soul,
Splurges of golds, and reds, and blues, and greens,
Huge malformed arms and legs, translunar scenes,
Strange cubes evolving into half-guessed forms,
Cyclones of green, and purple rainbow-storms.
Thus artists on huge Jupiter might paint
(Or some mad star beyond the earth's constraint)
Maelstroms of limbs, great eyes that flame in gloom,
Moons red as blood, and sunsets husht with doom,
Malignant faces, pink sands, yellow flesh—
And every picture stabs the eye afresh!

Some madly launch in space, but, here and there,
A touch is seen that masters could not spare.

You go out with a whirlwind in your head.
The thing, at least, is not inert and dead;
There's life and motion there, and rending force,
Color-Niagaras thundering on their course,
Power that breaks like a great wave in spray—
And what it means we'll let Tomorrow say!

New York City.

The Backward Nation

By Count Albert Apponyi

[The article by Theodore Marburg on "The Backward Nation," publisht June 20, 1912, attracted widespread interest and elicited a large number of letters, a selection of which appeared in our issue of November 7, 1912. The following additional letter, received too late to be included in that symposium, deserves publication by itself because of its application to the present Balkan crisis. The opinion of the distinguisht Hungarian statesman on this subject is of especial value, as he has for years been one of the leaders of the nationalist party in the defense of the rights of the Magyars against the aggressions of the dominant partner in the dual empire, and he has also championed the peace movement, in the interests of which he made a tour of the United States in 1911.—EDITOR.]

BUDAPEST, Hungary, January 13, 1915.

DEAR MR. MARBURG:—Kindly excuse my being so late to answer your most interesting letter. The distracted state of my country, torn by the animosities of a constitutional conflict, while the possibility of a foreign entanglement threatens her from without, makes it almost impossible for me to give much attention to international problems. Nevertheless I shall give you my impression of your scheme as well as I can under circumstances so unfavorable for quiet brain work.

What you suggest is that the "enlightened powers," big and small, should combine to enforce, by peaceful means if possible, the reign of justice, humanity, fairness to foreigners on the territory owned by "backward nations." They should appoint a commission for that purpose, whose action would be disinterested, precisely because it contains representatives of all the enlightened powers and not only of such among them as happen to be interested in the affairs of a particular backward nation. It would probably secure peace in most cases, because no backward nation would dare to resist the joint applications of so many powers and because the particularly interested ones among the latter would be prevented from quarreling about their claims, the whole question being lifted up into the higher domain of principle.

It is certainly a fascinating idea, tho its application does not seem possible—as you own yourself—to the case of bigger backward nations. But even within its limits the scheme is beset with difficulties, some of which I shall try to point out.

To begin with: the classification of nations into enlightened and backward ones is not easily effected in a way to command general recognition. There are degrees of enlightenment and of backwardness; it is often a question of composition. The Balkan states, for instance, claim moral superiority as compared to Turkey and upon the whole, for some of them at least, I am ready to admit the claim, tho I am afraid their methods of warfare do not warrant their inclusion in the list of enlightened nations, in the absolute sense of the word. Where, then, is the line to be drawn, and who is to draw it? On your own hemisphere you seem to hesitate in the case of all South American republics, Argentina and Chile excepted. On what principle is this preliminary question to be decided?

My second difficulty is the question of disinterestedness. You anticipate that it would be an offspring of the institution devised; I rather think that the working of the institution presupposes disinterestedness. Those powers which have, or think they have, some national interest in the affairs of a particular backward nation—maybe a vital one—will hardly renounce their claims because an international commission gives a decision against them. To begin with, they will challenge the impartiality of the commission's verdict. Who on earth is impartial in any question whatever? In

the present Balkan tangle, for instance, Austria-Hungary, Russia and to some extent Italy are the interested powers; Germany and France have no sort of national interest in the affair; still in every Balkan question Germany sides with Austria-Hungary and France with Russia, because their general policy prompts them to do so. I do not mention England, because her position is too complicated to be explained in a few words. The really impartial nations in the present case would be the smaller ones: Belgium, Switzerland, Holland, the Scandinavian states. But can anyone who knows Europe suppose that the great powers would submit to the dictates of the small ones? America's intervention, on the other hand, might find itself faced by some sort of European Monroe Doctrine.

It is precisely the impossibility of grouping interested parties into disinterested action which has caused the failure of European diplomacy to prevent the outbreak of the present Balkan war. For years and years the powers seemed to agree with each other on the *status quo* formula; but this was an insincere formula and a mock agreement. Everybody knew that the actual state of things in Turkey was unbearable; everybody knew that Turkey was organically unable to effect reforms for the benefit of her non-Mahometan subjects, and still everybody pretended to make her effect them, because everybody foresaw the conflict that would arise when Turkey collapst. What the powers were agreed upon was simply to postpone as long as possible the hour of actual conflict among them. Now the Balkan states took the matter in hand and fought successfully on behalf of their Christian and racial brethren. Was there any peaceful solution of the problem within the limits of possibility, since Turkey neither could reform, nor would renounce any part of her territory? I own to feeling baffled in my pacifist creed by the present Balkan crisis. I do not see how results, essential from the standpoint of superior justice, could have been obtained in the present case without war.

Still I see the perils of violence, even when used for a moral purpose. The victorious Balkan states seem on the verge of a quarrel over the spoils; they seem averse to granting to Albania the independence they claimed for their racial brethren. The great powers, on the other hand, while asserting their right to revise and finally to settle the territorial arrangements on the Balkans, are bent on compromising or on enforcing, as it may happen, their special interests, rather than on keeping the Balkan states within the limits of justice and humanity.

The present Balkan case is most illustrative of the difficulties which beset your project. Still I congratulate you on having devised it and on having opened thereby discussion concerning the more arduous section of the peace problem; the securing of a peaceful solution of conflicts for the settlement of which no juridical principle exists, which cannot be constructed into a clear question of right or wrong. I pointed out this difficulty in my lectures delivered last year in America; I called the attention of my audiences to the fact that, while there is a growing willingness to submit international disputes of a juridical nature to arbitration, it is as yet hardly conceivable that a nation should renounce claims founded on interests conflicting with interests because somebody declares that her doing so seems fit from the standpoint of superior wisdom. It was conflicts of this kind which President Taft had in view, when even he, while making a bold advance toward obligatory arbitration, while dropping the "national honor and vital interests" clause, still admitted the existence of non-arbitrable cases. We have, in theory at least, a tolerably well devised international judicial institution, for cases which a judge can decide; but we have nothing, not even a theory, for the peaceful solution of non-arbitrable cases. Your scheme is the first step toward the making of

such a theory; the idea is launcht, discussion must ripen it. My present remarks have no other object but to bring into evidence the importance of your suggestion and to promote its development into a most valuable addition to the pacifist system.

I leave it entirely with you to judge whether these remarks deserve publication. In any case believe me to be in grateful remembrance of your and your countrymen's kind hospitality,

Yours very truly,

ALBERT APPONYI.

Irish Plays and Players

By Warren Barton Blake

[The enduring popularity of the Abbey Theatre players, presenting the works of John M. Synge, W. B. Yeats, Lady Gregory, Bernard Shaw and other playwrights, has been attested by their reception on their second visit to Chicago and New York. They are now acting in the latter city, and there has been no endeavor so far to repeat last year's hostile demonstrations on the part of certain Irish societies.—EDITOR.]

Two years ago people were still undecided as to the pronunciation of the name Synge—those of them, that is, who had ever seen or heard it. Today they know that it rimes with bring, and is not to be spoken, as one churchman would have it, à la française. Synge and the Irish theater have, indeed, become a stereotypt subject of discussion; a subject political and religious as well as literary; a subject bruited wherever there are reviews and bluestockings and newspapers; the subject of several books publisht in Ireland and England and America; even the subject of dissertations in academic Paris. Synge has also been interpreted by players of his own and other nationalities in London, Stratford, New York, Chicago and other cities, as he had been, still earlier, on the continent of Europe. Synge remains the greatest dramatist of the Irish literary movement, even tho the latest historian of that movement can write that, without Mr. Yeats, the new Irish drama "would not have amounted to much"; that "Synge had not been, Lady Gregory would not have written her farces and folk-histories, the younger playwrights of Cork and Belfast would have written plays very other from those they have written."*

Mr. Weygandt is, I believe, an instructor in the University of Pennsylvania. He has, at any rate, written a book at once comprehensive and, to anyone with some prior knowledge of the field, interesting: a volume which brings together more valuable material, from the historical standpoint, than any other dealing with the subject; a volume which is most sensible and balanced as a literary appreciation. There was a place for just this book, which is deficient only in color and distinction of style. Decidedly friendly to the work of Synge, Yeats, Lady Gregory, Douglas Hyde, and the other standard-bearers of Ireland renascent, Mr. Weygandt is in no sense hysteric or exaggerated in his sympathetic interpretation of their ideals and achievements. His book is that of a scholar not out of joint with his times, but capable of applying taste and learning to what seems, momentarily, the most notable contemporary performance of the English-singing muse. If in a rambling commentary upon his book I ignore his comment on George Moore, his digression on William Sharp, and many other chapters, that is only because it suits my own convenience so to do.

It has been a favorite reproach of the detractors that the Irish playwrights are not truly Irish. Priestly critics and others have dubbed Mr. Yeats an imitative Maeterlinck; one of them, at least, has with less plausibility associated Lady Gregory and—of all names!—Ibsen. Synge has been

*_Irish Plays and Playwrights_. By Cornelius Weygandt. Pp. 314. With illustrations. Boston: Houghton-Mifflin Company. $2.

hailed as an echo of Loti, because there is a hint of the *Iceland Fisherman* in the dramatic narrative *Riders to the Sea.* Baudelaire's name has been dragged in, too—an analogy never made convincing, least of all in Mr. Turquet-Milnes's pretentious monograph.* There is just this much

of reproach, in the estimation of many patriotic Irishmen, that Mr. Martyn learned his art of Ibsen, and Mr. Yeats a part of his of M. Maeterlinck, but that attitude is as unreasonable as that which would reproach the Irish Industries Organization Society for studying Danish dairy farms or Belgian chickeries. . . It is in character, in ideals, in atmosphere, in color,

A VIOLENT SCENE IN A VIOLENT PLAY

"Birthright," by T. C. Murray, might have for its subtitle, "A Tragedy of Brotherhood." The brothers here are the central figures; the parents are trying to restrain their jealous anger. In fact, however, it is the parents no less than the brothers who are responsible for the murder which ends the piece. The second figure from the left is that of Fred O'Donovan, who also plays the title part in Synge's "Playboy."

justice in all these attempts at literary comparison: none of the Irish authors has been wholly ignorant of Scandinavian pessimism and French technique. But there has been no little distortion of the truth to fit the requirements of special pleading. Mr. Weygandt expresses the common-sense view when he writes:

The drama of the Celtic renaissance is of an ancestry as mixed as is that of the people of Ireland themselves. It is a matter that drama must be native, and in color and atmosphere, in ideals and in character, the Abbey Theater drama is Irish. . . .

It is, as a matter of fact, no less natively Irish than the Elizabethan drama is natively English; it is really more native, for no part of it of moment veils its nationality under even so slight a disguise as "the Italian convention" of that drama. The new Irish drama is more native in its stories than is the Elizabethan drama, as these stories, even when they are stories found in variant forms in other countries, are given the tones of Irish life.

Mr. Weygandt's question whether poetry has not lost more than drama

**The Influence of Baudelaire in France and England.* By G. Turquet-Milnes. Pp. 300. New York: E. P. Dutton & Co. $2.50. Cf page 249.

has gained in Mr. Yeats's preoccupation, in recent years, with stage plays need not detain us at this moment. Mr. Yeats's work,

> wild thought
> Fed on extravagant poetry, and lit
> By such a dazzle of old fabulous tales,

deserves study for and by itself, rather than the mere passing word which might here be accorded. Tho Yeats it is who, more than any other, has given the impetus to other poets and playwrights, it is Synge's dramatic work that dominates the repertory of the Abbey Theater, both directly and thru its disciples, and Synge's work is, fortunately, better known than that of any of his fellow-workers.

The acting of these Irish plays is, today, as absorbing a question as their nationality and their authorship, for the Dublin players who served as their interpreters last season—winning golden opinions and cat-calls and carrots, according to the religious and literary credo of their auditors—are once more with us. Mr. Weygandt's praise of these players is equally warm and deserved. "One need not say that the Irishman is a born actor; all the Celts are," he writes, "famed for 'the beautiful speaking'; for eloquence; for powers of impersonation; for quick changes of mood; for ease in running the gamut of the emotions." The critic aptly quotes—and the quotations made in this book furnish a great part of its value—a passage written by Mr. Yeats eleven years ago:

> The other day I saw Sarah Bernhardt and De Max in "Phèdre," and understood where Mr. Fay, who stage-manages the National Theatrical Company, had gone for his model. For long periods the performers would merely stand and pose, and I once counted twenty-seven quite slowly before anybody on a fairly well-filled stage moved, as it seemed, so much as an eyelash. . . It was the most beautiful thing I had ever seen upon the stage, and made me understand, in a new way, that saying of Goethe's which is understood everywhere but in England, "Art is art because it is not nature."

Lest this last phrase prove misleading, I hasten to add Synge's remark that "All art is a collaboration," Synge's own collaborators in dialog being a whole peasantry—poor in dollars, but rich in words and in imagination. And tho the art of Synge is, in spite of his critics, notably national, it is, with the best of the work of his fellow-countrymen, far from being *exclusively* national. "After all, there is but one race—humanity," as some one says in *The Bending of the Bough*. Is it not this same George Moore who writes: "Art must be parochial in the beginning to become cosmopolitan in the end"?

As it is with Synge, so is it with his interpreters, the players. Tho Mr. Weygandt can write that "the distinguishing characteristic of their art is naturalness," that naturalness is, as we have seen, founded upon experience. Knowing full well "the types of the folk plays, and even the characters who are not types," and themselves free of the paralyzing stage conventions, their work marks a sharp reaction against the unnecessarily exaggerated gesture and meaningless physical agitation with which actors in sophisticated London and New York have commonly tried to veil the artifice or emptiness of their stage plays. There is a fine fusion of photographic realism and poetic imagination in the new kind of theater. Very properly was their art developt in the little city of Dublin, the authors of the plays which were its medium holding London to be "too large, too old, and too wealthy to permit of any new artistic movement." "We have turned our backs upon London," wrote one of them in 1900, "as men turn their backs on a place which has ceased to interest them."* And Mr. Yeats added:

> Our movement is a return to the people, like the Russian movement of the early seventies. . . Plays about drawing-rooms are written for the middle classes of great cities, for the classes which live in drawing-rooms, but if you would uplift the man of the roads you must write about the

*George Moore in the preface to *The Tale of a Town*, the play known in America as *The Bending of the Bough*.

roads, or about the people of romance, or about great historical people.

The actors and actresses who first clothed these plays "of the road, of romance, or of the great historical people," with flesh and blood were amateurs gathered together in a little hall in Camden street, Dublin. Ten years ago the playwrights themselves lent a hand in the actual performing of their plays, and Æ might be seen as one of his own Druids, or Padraic Colum would carry a spear. It was not until 1904, when Miss Horniman, patroness of the Manchester Repertory Theater, gave her generous support (now discontinued) that the Dublin enterprise was placed upon a professional basis. Few of the original players remain, but something of their loyalty endures, along with all their wholesome enthusiasm and local flavor. The voices which utter the plays of the roads, the messages of mystery, the blendings of irony and passion, that constitute the Irish repertory, are voices which give point to the old saying that Dublin English is the richest and fullest and best English of all. There is, of course, a considerable variation between different members of the company, and one might end by finding some of the voices, charming as they are, monotonous in their very music; yet when would one weary of Mr. Arthur Sinclair's gusto, or of Miss Sara Algood's deep tones? Says Mr. Weygandt:

> The most beautiful English that I have ever listened to is the English of Synge as spoken by Mr. O'Donovan in Christy's "romancin'" to Pegeen Mike in the third act of *The Playboy*. His voice, full and mellow by nature, and in perfect control, responds to all the many changes of emotion that the part demands, the unmatched rhythm of the prose rendered as he renders it carrying one clean out of one's self as one listens. It is only when one comes to one's self on the curtain-fall that one finds one's self wondering, Can this be prose? Surely never before was prose, English prose, as beautiful to the ear as English verse.

The achievement of the Irish players with a body of material created for them by Irish playwrights within the last decade, or a little more, is notable indeed. Mr. Weygandt reminds us that in 1892 Miss Jane Barlow, writing of English literature in Ireland, found it "difficult to point out any quarter of the horizon as a probable source of rising light." But what has been done in a manner thoroly amateurish, to begin with, and, in certain aspects, even now, is not confined to literature in its significance. Like Mr. Gordon Craig's theories of stage settings, by which Mr. Yeats has profited not a little, the influence of the Abbey Theater is likely to be felt outside of Ireland and the theaters which the players visit here and abroad. Their own little house in Dublin cannot seat 600 persons. A lesson for us resides in these very figures; a lesson which we, who have suffered in drama as in other arts from Jumboism, have already turned to account. Yet this is not the principal lesson. Like other revolutionaries, these men of the Irish theater record a protest against sterile and unintelligent traditionalism; a tradition petrifying equally to literary style, dramatic construction, and theatrical interpretation. Even their younger playwrights—and Mr. Murray, Mr. Boyle, Mr. Lennox Robinson, Mr. Ervine, are far from being Synge's equals, or Yeats's—neither rehash last year's plays, nor dramatize last month's magazine. In this last respect they differ from our own Kleins and Sheldons. They look, rather, to the life which they best know, and know at first hand—village life, town life, countryside life—and they discover the fierceness of tragedy, the laughter of farce, as much present there as in the streets of London, or among the skyscrapers of Manhattan. Much of this drama is noted in a minor key, like Irish music, but who will not cry out in hearty gratitude that we are spared an Irish Bernstein? What the younger or cruder of their craftsmen lack in penetration or in agility is compensated for by the fine teamwork of their interpreters. Mr. Weygandt calls attention to the fact that Miss McGee, who plays the Pegeen Mike of *The Playboy* one evening of

her American engagement, plays next evening as one of a group of village girls in *The Well of the Saints*—with few words to speak, and no spotlight. It is out of this gild-spirit, this sinking of individual reputations in a common effort, that the triumph of the players has been achieved; and they realize that fact, and have so far resisted the efforts of certain American managers to detach some of their members from the organization. Only once in recent years have I seen any "ensemble" work to compare with that of the Irish players, and that is the work of the company which Mr. Norman McKinnel has brought out of England to the Little Theater in New York; work done in a powerful and displeasing little play by a reassuringly young woman: Miss Githa Sowerby's *Rutherford and Son*.

Superficial "points" are sacrificed by these Irish players, both as individuals earning a living and as actors and actresses conveying certain effects upon a stage. And thus is the real point of each of the plays they act for us brought out unblunted and untarnisht.

New York City.

Corporation Schools

A New Form of Vocational Training Recently Organized in a National Association

By F. C. Henderschott

[About two years ago the New York Edison Company, thru its general inspector, Mr. Arthur Williams, decided to institute educational work among its commercial or sales force. Mr. Henderschott was placed in charge of this department and made a study of many of the schools which had been instituted by various corporations in the United States. In perfecting the larger organization here described, Mr. Henderschott was ably assisted by Dr. Lee Galloway, of New York University, and Mr. E. J. Mehren, editor of the *Engineering Record*.—EDITOR.]

Whether or not our schools and universities are properly preparing their graduates for business life has long been a mooted question. In recent years some of the large corporations have answered in the negative by instituting what has become known as a corporation school.

The number of corporations that have provided special educational courses for their employees is not at this time known. A conservative estimate would be about two hundred.

Nearly twenty years ago Mr. J. A. Patterson, president of the National Cash Register Company, which was then a small but ambitious institution, called on one of his salesmen who had become ill while at the home office. This particular salesman had been more successful than others in disposing of cash registers, which fact was in the mind of Mr. Patterson, and during his call the conversation drifted to business, more especially to selling registers. It was during this conversation that the idea which has grown into the corporation school was first conceived. It occurred to Mr. Patterson that the selling methods of this particular salesman should be known to all the members of his sales force. A little later a meeting was held and the methods of selling carefully gone over. Each salesman contributed something to the success of this meeting, and as the business grew other meetings were held, other salesmen were instructed and finally a book known as the "primer" was issued.

It was not, however, until some four or five years ago that the corporation school assumed any considerable proportion. It would be difficult at this time to determine just where or in what corporations the movement has reached its best development.

So far as information is available,

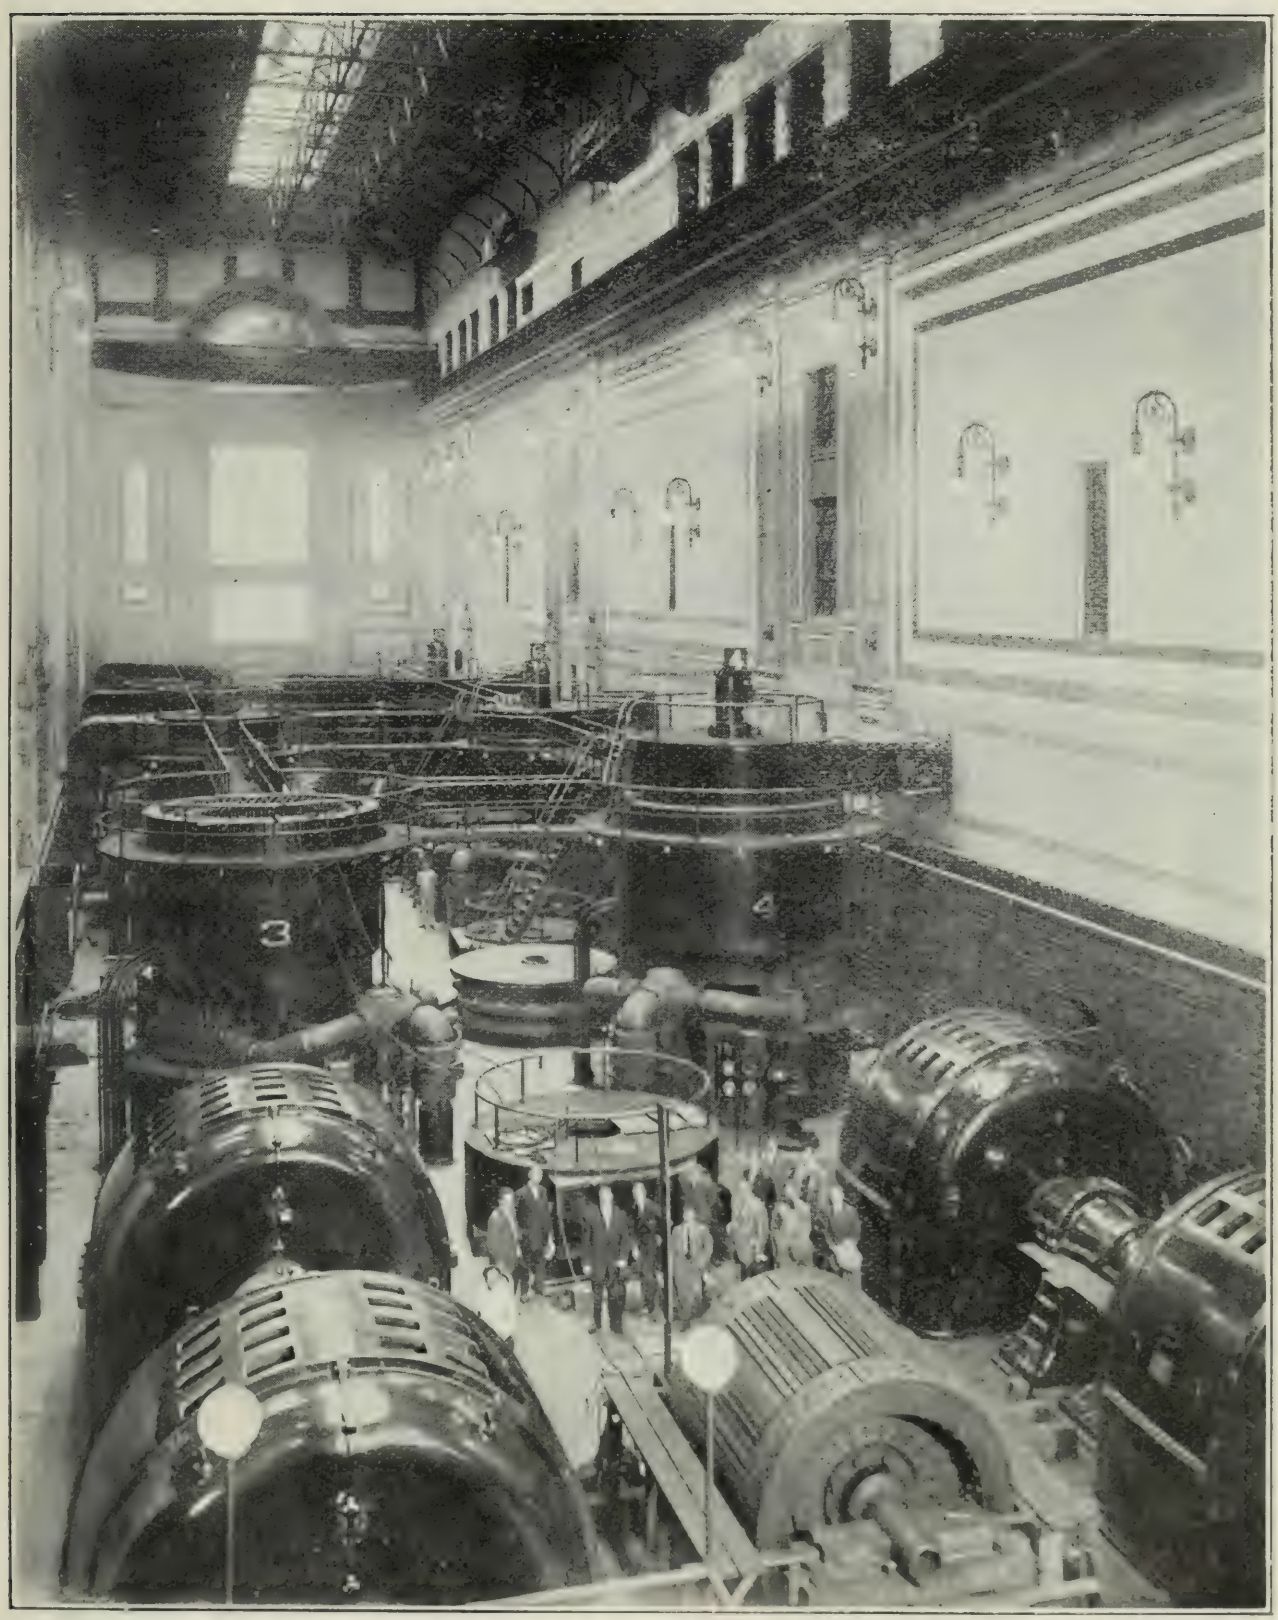
no two schools are using exactly the same methods. There is a similarity largely due to the fact that most institutions of the same classification have copied, in so far as seemed desirable, the methods in use by the National Cash Register Company.

The Burroughs Adding Machine Company's school was recently inspected by the writer and the resemblance between their educational courses and those of the National Cash Register Company was remarked. This was explained on the ground that they used the methods of the cash register company as a model, but this similarity of method holds only in industries which can be classed as manufacturing institutions whose products are largely specialties.

The Pennylvania Railroad probably designed its educational work without any reference to the courses of the National Cash Register Company. Other railroads, notably the Erie, the Santa Fé, the Grand Trunk System and the New York Central, have joined in the movement, but they seem to have been guided largely by a desire to perfect courses best adapted to their particular needs or requirements. The educational work of the John Wanamaker stores also shows originality, altho it has been copied in part by many of the larger merchandising institutions which have in some degree instituted educational work among their employees.

The electrical industry has taken a leading part in the work. The Westinghouse Electric and Manufacturing Company maintains extensive educational courses at its East Pittsburgh plant; the Western Electric Company has a well organized school at its Hawthorne plant in Chicago; the General Electric Company maintains five different schools covering different branches of their work, one being located at the East Lynn Works in East Lynn, Mass, and another in Pittsfield, of the same State; also a school for lamp salesmen at Harrison, N. J. Other courses are maintained at the general offices in Schenectady.

The innovation has probably reached its best development in the New York Edison Company, which promoted the larger conception resulting in the convention held at New York University on January 24, when the National Association was organized.



Forty-three corporations were represented at this meeting by some fifty delegates. The Yale & Towne Manufacturing Company have taken a leading part, as have also the gas interests, especially the Consolidated Gas Company of New York; The Larkin Company, of Buffalo; the American Locomotive Company; Spirella Company, of Meadville, Pa.; McGraw Publishing Company; Dodge Manufacturing Company, Mishawaka, Ind.; Tide Water Oil Company, of Bayonne, N. J.; Aetna Life Insurance Company, of Hartford, Conn.; Westinghouse Air Brake Company; Curtis Publishing Company; United Dry Goods Company, and Bausch & Lomb Optical Company, of Rochester, N. Y., were all represented at this convention.

New York corporations manifested a keen interest. Representatives of Spencer Trask & Co., R. H. Macy & Co., Gimbel Brothers, Thomas A. Edison, Inc., and Speyer & Co., were present and assisted in perfecting the national organization.

A delegate from the German-American Button Company, of Rochester, N. Y., was present, and he brought a letter from the president of the Rochester Chamber of Commerce and the Mayor of Rochester, extending an invitation to hold the next convention in their city.

Many other corporations were represented, as were also the Manufacturers' Association of New York, the American Institute of Electrical Engineers, the American Electric Railway Association, the Commission of Education of New Jersey, Columbia University, Tufts College and the University of Pennsylvania. The latter organizations are not eligible to membership, but are deeply interested in the movement.

Owing to the unorganized condition

A LABORATORY WITH LIFE SIZE APPARATUS

Students in the Commercial School visiting the watershed central station of the New York Edison Company. The combined capacity of the generators in these stations is over 350,000 horse power. The power generated is transmitted to thirty-five substations and transformer stations situated in Manhattan and the Bronx, from which points it is distributed over an area of 60 square miles to more than 150,000 customers.

of the movement the activities of the first year will be largely confined to constructive work; finding out what has been done, selecting and compiling successful methods, classifying courses so as to take care of salesmanship, accounting, technical instruction, clerical work, office detail, etc. No effort will be made to formulate general courses and nothing will be attempted in the line of correspondence methods, as this is furthest from the objects sought. Each corporation, regardless of the fact that it may belong to a special group of industry, has its individual needs, and work will be conducted along lines that will best supply its requirements.

Many successful executives, without regard to the particular industry in which they are engaged, have endorsed the plan. Effort will be made to connect the corporation school with the older establisht form of education, universities, common and high schools, vocational schools and what is known as the Wisconsin movement, and the vocational work which has been done, notably in the Cincinnati University and at Pittsburgh.

To be more specific and take up in detail the work of one corporation: the New York Edison Company maintains three schools, the technical course establisht some six years ago being the oldest. The courses have been lengthened and improved and at the present time cover a period of four years—twenty weeks each year. They are classified as follows:

Course I—Mechanics, Heat and Physical Measurements.

Course II—Elementary Principles of Electricity.

Course III—Direct Current Machines and Testing.

Course IV—Alternating Current Apparatus.

THE TRIAL BALANCE OF KNOWLEDGE

Employees enrolled in the Commercial School writing their examinations, which occur every other week and cover the instruction given in the lecture of the preceding week. They are held on company time, as are all of the Commercial School sessions.

The object of these courses is to develop a higher grade of technical workmen, to improve the quality of the company's output and its methods of generating and distribution.

The second school establisht by the New York Edison Company covers the work of the contract and inspection department, or more broadly speaking, its sales force. This course covers a period of two years. The first year "Elements of Central Station Business Getting" and "The Fundamental Principles of Electricity" are taught, and there are also six inspirational lectures classed under the heading, "Basic Principles of Individual Efficiency." These lectures are on such subjects as "The Value of Right Thinking"; "Courtesy"; "Education — What to Learn"; "The Test of Individual Efficiency"; "The Six Steps in Salesmanship"; "The Power of Confidence —Self-Development."

During the second year instruction is given in "Hygiene, Health and Recreation, and Elements of Psychology," a course of six lectures by the best authorities obtainable. No expense is spared to secure the highest grade of instruction. Dr. Luther Halsey Gulick, Dr. Woods Hutchinson and Dr. James J. Walsh, formerly dean of Fordham University Medical School and a contributing editor of THE INDEPENDENT, are among the lecturers in this course, as is also Walter Dill Scott, professor of psychology of Northwestern University.

The second year course embraces nine lectures on "The Basic Principles of Salesmanship and Their Relation to Business Building." The third and last course of the second year term is composed of twenty-six lectures on "The Policies and Organization of the New York Edison Company." The subjects in this course are handled by heads of the company's various departments and bureaus. The course is designed to thoroly familiarize each representative of the company, who comes in direct contact with the public, with every detail of the company's work. In a word, to render better, more efficient and a larger measure of service to the public.

Attendance in the commercial school is compulsory. All sessions are held on company time and employees are paid while taking their courses.

Last fall a school was started for accountants. This school, like the technical, consists of evening courses and enrollment is optional. The accounting course consists of a one-year term divided into three parts, namely: theory, practice and public policy.

Professor Madden, of New York University, gives a series of lectures in the first part; the second part of the course is covered by five lectures given by department heads of the company, and the third is constituted partly of lectures by the executives of the company and partly by talent secured from outside.

The New York Edison Company's educational work is cited as simply an instance of what corporations are doing. Equally interesting reports could be prepared regarding many of the other schools. Some corporations maintain only technical courses, whereas others have instituted educational work in all of their various branches, for example the General Electric Company.

Some corporations have failed in their efforts to establish schools, but not one, so far as I am advised, has relinquisht its belief that proper educational work is beneficial and contributes to a material increase in efficiency of their organization.

New York City.

The War With Monopoly

By Hon. William E. Borah

[Mr. Borah, of Idaho, was recently reëlected to the Senate. His first term expires this year. He is chairman of the Committee on Education and Labor, and a member of other prominent committees, including those on Foreign Relations, the Judiciary, and Interoceanic Canals. The following article sets forth his views as to the responsibility of State legislatures for the growth of monopolistic combinations, and points out how States may deal with such combinations by means of corporate charters. He would have the Sherman act made specific, and the proposed appointment of a Federal commission to regulate combinations is not approved by him.—EDITOR.]

Since the close of the civil war our industrial growth has been a marvel. The self-sustaining community has disappeared, combination has followed fast upon coöperation, independent business institutions have given way to aggregations of wealth stupendous in their reach and influence. All this has brought many comforts and many blessings, but also many evils and wrongs and gigantic problems with which the Government now has to deal. The tremendous import of the question ought to make us tolerant of all honest efforts to deal with it, and the consequences to follow success or failure ought to steady us with caution and courage.

We make a mistake in dealing with the question purely as an economic problem or as a matter of business. It is also a question of government, and more; it has at its base a question of morals. There is in it a supreme question of justice, of right and wrong, as searching and universal in its last analysis as the principle which sent our veterans to the battlefield fifty years ago. Mr. Webster once said: "The freest government, if it could exist, would not long be accepted if the tendency of the laws was to create a rapid accumulation of property in a few hands and to render the great mass of the people dependent."

Monopoly is at war with democratic institutions. The conflict is irrepressible. Twenty-odd years ago we began to deal with the subject. We placed upon our statute books and among our laws a denunciation of monopoly. It was a correct principle courageously announced; but the manner of dealing with the subject to the best interests of all no human foresight could determine. Experience was necessary to such legislation. The Anglo-Saxon mind builds permanently because it builds in the light of compromise, adaptation and experience. Those who placed upon our statute books the republic's open declaration of war with monopoly foresaw with clearness and certainty the evil, and with equal clearness and certainty they denounced it. But what they did more than twenty years ago is all that our law-making body has yet seen fit to do.

It must be apparent to all that, standing alone and unaided, the Sherman law cannot accomplish what its authors hoped. They underestimated the ingenuity, the almost supernatural sagacity of greed. It has neither destroyed nor curbed monopoly. The period during which this statute has been upon our statute books is marked as the period of the greatest growth of trusts and the most pronounced decadence of competition. Almost everything which we eat, almost everything which we wear, all we have and all we want are affected and controlled by combinations built up in defiance of this law. So far as the man in the street is concerned, competition is dead. The destructive, annihilating forces of combinations are fast sweeping from the whole field of industry the independent producer and manufacturer.

Men who are in a position to know the truth, but who are far from anx-

ious to give it publicity, have been forced within the past few weeks to testify to a condition of affairs which must be regarded as no less than startling. Blast furnaces and business institutions are closed from time to time, in order to increase the price of things which the people must have. After paying freight and insurance, our products are sold in foreign markets cheaper than to our own people. At banquet boards men meet and determine what price shall be put upon the necessities of life for ninety millions of people, some of whom are hard prest to live. Territory is divided among powerful interests, and fines and punishments administered for lowering a price agreed upon, with all the arbitrary power of an ancient sovereignty. They tell us that less than two hundred men practically dominate the banking and business interests of the country with a relentless vigilance never exercised by the most arbitrary government; and, with a grace of egotism as refined as it was apparently unconscious, they admitted that this would be a menace, grave and imminent, to our Government if such power should accidentally drift into bad hands.

Thus it is evident that the anti-trust law is not accomplishing and cannot, as it now stands, accomplish its purpose. But, to my mind, there is another equally serious indictment against it. It is shifting to the courts the work which the courts are unfitted and were never designed to do; and which, in the end, will break down our entire judicial system. The courts are now called upon to supervise and censor business methods, the degrees and forms of competition, the amount and extent of business which particular corporations are to enjoy, till the whole business world, the whole vast realm of economics, is to be regulated, directed, and controlled by judicial decree. It would be a farce if it were not a tragedy.

There is no greater tribunal among men than our own Supreme Federal Court. But for this work to go on in this way must inevitably involve that tribunal in a task which no judicial body can perform. The immediate result is apparent. When we find no relief in the Sherman law we criticize the courts. But the blame is not there. It is downright intellectual cowardice, if not moral delinquency, to lead the people of this country to believe that relief can be realized by attacking the courts for not doing well what they ought not to be called upon to do at all.

I venture to say, and I stand ready to maintain it, that if the law-making bodies of this country would incorporate in our laws the principles long ago announced by the Supreme Court of the United States and then provide the administrative machinery to enforce them, leaving the courts to determine only those matters which are purely judicial, there would not be a monopoly left in the country inside of a decade.

Many years ago Chief Justice Taney, speaking for the court, said that corporations are limited strictly to those powers given them by legislatures, and that all doubts as to power were to be resolved against the corporations. This put the whole matter up to the State legislatures, the immediate representatives of the people.

The truth is that there is not a monopoly in existence to-day that is not in existence by express authority of some State of this Union. There is not a corporation exercising unjust and unfair powers in the world of commerce that is not doing so thru the express authority and the express approval of some State legislature. When the courts declared that without the express authority of the legislature one corporation could not hold or vote stock of another corporation, legislatures at once began to grant this extraordinary authority—the parent authority of all of our present monopolies.

The Supreme Court also laid down the rule that, altho not so provided in the charter, the State had the right to forfeit every corporate charter for misuse or abuse of power. Thus, if our State legislatures would exercise the powers they have and

discharge the duties clearly devolving upon them, they could strip the entire country of monopolies. Or if the Congress should declare that no corporation should engage in interstate trade so long as it held or sought to vote the stock of another corporation, the trust question would be very near the beginning of its end.

Nothing could be more simple, direct or effective. But while reaching out for more power, while traversing the realm of governmental fancy, while talking about changes in government and the building of bureaus, we shamelessly refuse to exercise the power easily at our command or to discharge the simplest and most primary duty of citizenship. With full power to forfeit every charter which is being used to the detriment of the people, we continue to permit the corporations to exercise their sovereign powers. Upon what theory do we send men to prison for violating the law and permit corporations living in open defiance of the law to enjoy their grants of sovereignty from the States? Upon what theory do we permit corporations to invade the channels of interstate trade when they have been convicted of crime and are living in open defiance of the law? Upon what theory do we permit them to organize and issue fraudulent stock—to the amount in a single instance of seven hundred millions of dollars—and put it out to the people?

The whole question of monopoly goes back to the charter powers of our corporations, and the charter powers of our corporations come from the specific grants of the several State legislatures. I would not repeal the Sherman law, but I would reduce it from a generalization to a specific, enforceable statute. It would be just about as practicable to try a man who takes the life of another for retarding the development of the human family, instead of for the offense of homicide, as to try a corporation guilty of specific acts of fraud and extortion for restraining trade, and letting it finally escape thru the interminable labyrinth of scholastic discussion as to what constitutes a restraint of trade.

Small minds and narrow partisans seek to divert attention by trying to find some one to blame for these monopolies being here. The fact is they are here largely thru the fault of the whole people, and they will be here till the whole people are aroused to the full import of the menace, and realize the simplicity of the remedy. When we, as a people, understand that this is not a question of economics alone, but that institutions and citizenship are involved; when we understand that monopoly undermines government, establishes and enthrones classes, demoralizes and destroys citizenship, eats away the sturdy virtues of men and women, then, and not till then, will we deal with the matter successfully. Then we shall no longer be satisfied with efforts to mollify the evil effects thru commissions and bureaus at Washington.

Those who now have great charter advantages, and who have gathered vast fortunes thru extortion and fraud, are especially anxious—deliriously anxious—to be managed in this way. But I for one am not willing to gorge these monsters upon State charters, with their startling and exceptional powers, and then erect a bureau at Washington in the fond hope of keeping them within their cages. The State has no right to grant to individuals the powers of monopoly and then trifle with the people's hopes by promising safety in a commission. If I had my way I would make this a government of law in these matters instead of a government of spasmodic, individual departmental discretion. I would make every corporation convicted of wrongdoing an outlaw to the channels of interstate trade. When I see a great corporation condemned in unmeasured terms by the Supreme Court of the United States, and against which a decree has been entered, still openly, brazenly, defiantly putting aside all principles of justice and ignoring every provision of law, there is nothing I would not do, in a

legal and orderly way, to destroy it. Men who set such an example of lawlessness in a government of law ought to be punished in a way which befits the crime.

We must either change these conditions or the conditions will change the republic. The war between the republic and monopoly must be one of extinction — there is no neutral ground. The course is plain and simple if we will only adopt it. Those who would denounce our form of government and the institutions under which we live are not safe leaders in a crisis like this. Those who doubt the capacity of the people to maintain and sustain and run this government are equally unsafe. There is strength and efficiency enough in this republic, and wisdom and patriotism enough among the people, to do justice as thoroly as justice was ever done in former days. But we must apply ourselves to the task and do our duty.

Confronting us is a question upon which turns the happiness of our children and our children's children and the perpetuity of the republic—the greatest of all problems when measured by its tendency to search and test the powers of free government. With this great issue before us we are driven to consider whether we are worthy of our inheritance. Our fathers believed that business prosperity not founded in justice, resting upon fraud and oppression, was in the end far worse than no prosperity at all. If we are worthy of them we will apply the same rule and restore justice, let the cost be what it may.

Washington, D. C.

The Land of Silence

By Elliot Field

(Captain Robert F. Scott and Comrades)

Deep in the heart of the snow they lie,
Deep in the heart of the snow,
'Neath a cross-crowned cairn, under storm-swept sky,
Where only the brave may go.
Down the twice blazed trail in the shuddering cold,
In the land of silence their tale is told,
Ice mantling shrouds their limbs enfold
In their bed in the heart of the snow,

Deep in the heart of the world they live,
Deep in the heart of the world,
Men of the mold of those who give
Their all for a flag unfurled
At the end of the earth, but it marks the goal
Of a selfless courage, no dribbled dole
Of a half-lived life,—'twas the call of the soul,
For a home in the heart of the world.

Wissahickon, Pa.

Is Culture Jeopardized?

By A. E. Winship

[The question, now so hotly discussed, of whether the admission of vocational studies to the curriculum will endanger cultural education is here answered in an original manner by the editor of the *Journal of Education*, whose idea of what constitutes true culture will certainly not be considered low.—EDITOR.]

Is culture jeopardized by the non-culture courses permitted by the elective system in high schools and colleges?

No, emphatically no. Of course that is mere opinion which could be offset by opinions of thousands of men in high schools and colleges. An opinion is worth no more than what is behind it. An opinion based on adequate investigation and demonstration is worth more than ten thousand opinions based merely upon tradition and prejudice. One opinion that stands for something vital can put to flight an army of ten thousand opinions of traditional prejudice.

What is culture? It is skill in the art of doing things subconsciously that are well worth while in good society.

No subject in school or college is of itself cultural since culture is what one gets from the study, is what the study helps him to think and say and do subconsciously that is worth his while to do well.

One may get this skill from one subject and another from some other. Nothing is culture that one cannot do naturally, gracefully, artistically. Somewhat of this may be inherited or attained unconsciously from environment independent of schools and teachers, but we are speaking of the culture which one attains or intensifies in school.

There are as many strains of culture as there are of thorobreds in the animal kingdom, but the school is supposed to make for scholastic culture, and of that we are speaking here.

The hight of scholastic culture is assumed to be attained thru a mastery of Greek and in a slightly less degree thru Latin, while there can be no pretense to scholarly culture if one cannot speak with some ease both French and German. From this standard we hazard nothing in facing the scholastic Goliaths with our pebble slogan that culture is aided and not jeopardized by the new order of things.

For demonstration: In a thoroly Western city in the Intermountain region Miss G. has been teaching algebra for eight years. She had specialized in mathematics, taking her master's degree in that subject in one of the most cultural universities of the Atlantic coast. A new superintendent, one of the very up-to-date young men, told the students that thereafter, upon due conference with the principal, they might substitute music, biology, drawing, architecture, agriculture, a commercial branch, manual training or domestic science for algebra, geometry, physical geography, ancient history or some kindred branch in the traditional curriculum. Miss G. was paralyzed. In all sincerity she came to me for advice. What should she do? What could she do?

She had devoted years to preparing herself to teach mathematics, and there was to be no teaching of mathematics after a little while. Should she study to teach domestic science or commercial branches? That was the only question in her mind. "Wait a little," was the only advice given.

Two years later she said:—"Why, will you believe it, I never enjoyed teaching algebra until these two years; I have no students who cannot appreciate algebra, who do not enjoy the subject, who are not getting real power thru the study, and, most surprising of all, I have more students in algebra than I ever had before. There are so many more students in the high school that those who wish to take algebra are more than ever."

There is no possible culture in the

study of a subject to one who in no sense masters it. There is no culture in Greek or Latin, French or German until one can read the original and get the message and spirit of it without translating. It is like pretending to be delighted to meet an old friend when you have not the slightest idea who he is and trying to dodge exposure of hypocrisy until you can see his name on the hotel register.

Of course, one must do a lot of non-cultural work before he can get culture out of Greek. There is much of grammar, of conjugation and of turning the pages of the lexicon that is indispensable before there is culture, but it is not culture.

Before a man from Maine can know and enjoy Southern California there are thousands of miles of travel, some of the way thru deserts. He is on the way as soon as he starts from the home station, but he knows nothing of Southern California till he gets there. It is all well worth while if he is going there, but it is a poor investment of time and money if he knows all the time that he is to turn around and come back from the mid-desert region. This is not saying that he will not learn much by a trip to Yuma or Winnemucca and back, but so far as Southern California is concerned he would have learned more by putting half the money into books and pictures on Southern California and half the number of hours in reading and studying the picture.

And as to travel culture, he would have gotten vastly more if he had spent the same amount of money wisely in New England travel, and if travel by train is a bore to him, he better have stayed in Aroostook and made excursions by team to Fort Kent, St. Johns and Bangor.

If one is bored by a foreign language, living or dead, and is not to study it long enough to get any culture from it, there is no more advantage to the school than to him in making him grub the sage brush from what is to him a desert waste.

The students who love culture studies who are bent on the pursuit of culture, are handicapped in a class in which are several associates who must be prodded all the time, who take the teacher's energy, who chill everybody's scholastic ardor.

There are but two propositions as to the public high school: Shall it give to every young person something which will make life more worth while to him and him more worth while to the world, or, shall it eliminate from high school and college all who will not pretend to get culture from culture subjects that bore them?

If investigation and demonstration count for anything, then American culture will gain much when those who can get more culture from sugar-beet roots than Greek roots are permitted to transfer their devotion from a dead language that makes them sour to a live source of sweetness.

Boston, Mass.

The Dark Hall

By Madison Cawein

There is a hall in every house,
Behind whose wainscot gnaws the mouse;
Upon each side are ghostly rooms,
Peopled with dreams and ancient dooms,
When down this hall you take your light,
And face alone the empty night,—
Be like the child who goes to bed,
The little child who, tho a-dread
Of something crouching crookedly
In every corner he can see,
Ready to snatch him into gloom,
Yet goes on bravely to his room,
Knowing above him, watching there,
His Father waits upon the stair.

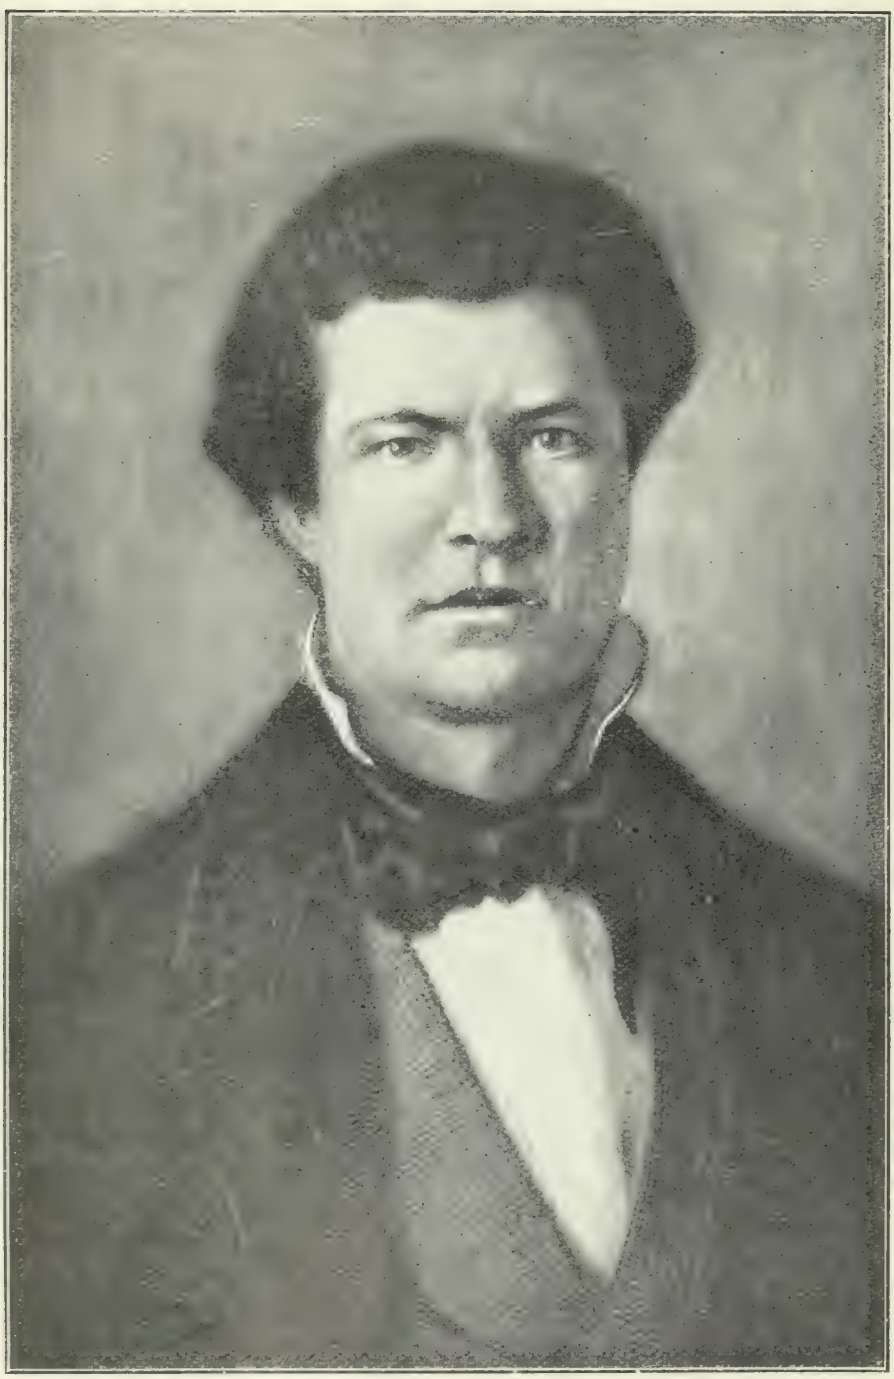
THE GENERAL:—"I don't recognize her, but let her 'escape' in the usual way."

THE NEW BOOKS

The Biography of Mark Twain

This is assuredly a great biography, probably the best ever written in America.* If this seems an unwarranted superlative, let the skeptic do what I have done, read all the seventeen hundred pages, and then compare the work with any other "Life" of an American man of letters. The subject is unique: no one ever lived who resembled Mark Twain, and we shall not look upon his like again. The sober history of his career is an astounding drama, stranger than a wild romance, more antecedently improbable than an absurd melodrama. Born in obscure poverty, with a minimum of polite education, he had only one great teacher—the Mississippi River. He loved the Father of Waters with such intense devotion that it is probable he would have remained a happily contented pilot till the end of his days, if the outbreak of the Civil War had not driven him from its surface. Then came his long-distance coach trip, from the banks of the river to the neighborhood of the Pacific. As a gold hunter in Nevada, he differed little from the other tramp miners, sharing their unspeakable privations and hardships, buoyed up by their dreams of sudden wealth, and missing success by a hair. Had he won the prize he so ardently sought, and so narrowly lost, it seems certain that his wealth would have kept him in as dark an obscurity as the poverty that chastened his childhood. In the variegated months of hand-to-mouth journalism he unconsciously passed thru his training for creative art. Suddenly seizing the lucky opportunity of a trip to the Sandwich Islands, he discovered on his return that he was a great lecturer—one of the best platform speakers of his time. This afforded him his next fine chance, the voyage to Europe, with the *Innocents Abroad* as the splendid result. This changed his growing notoriety to solid and permanent fame. His marriage with a woman of beautiful and noble character, who for so many years gave him the double assistance of constant inspiration and fearless, ruthless criticism, was of incalculable assistance on his steady march upward. How much he learned from her, and how profound was his gratitude and reverence, every reader of this biography can see for himself.



Popular fame on both sides of the water brought the academic recognition that supplied the place of early schooling. Yale University was the first institution to make him an honorary graduate: other honors followed from the same university, and from others; till at last came what was to him the highest prize of all, the degree from Oxford. Some of his "classmates" on this occasion were Rudyard Kipling, Prime Minister Campbell-Bannerman, William Booth, Sir Norman Lockyer, Auguste Rodin and Saint-Saëns, men of literally world-wide fame. Yet, as a French journal stated the case, "Proud as we are of our distinguished countrymen, the undeniable truth is that the American, Mark Twain, was unquestionably the greatest figure at the Oxford ceremonial, and was as such universally recognized by the throng."

I well remember once asking Mark Twain if, in looking back on his career, from the Mississippi steamers to recognition by every court in Europe, he did not feel happy and proud at the thought that all of this had come about by his own unaided

**Mark Twain: A Biography.* By Albert Bigelow Paine. 3 volumes, 8vo, illustrated. New York: Harper & Brothers. $6.

efforts in literature. He drawled out: "I do view it with considerable satisfaction."

The series of successes and the wonderful happiness of middle age were counterbalanced by tragic suffering in his later years. The loss of his fortune; the death of a brilliant daughter, whose diary showed extraordinary mental power; the unspeakable loss in the death of his wife: and at the very close of his days, the sudden death of his daughter Jean. No one who did not know Jean Clemens personally could even guess from hearsay testimony the grace and charm of her character. I have a letter from her that I have reread a hundred times. During the last months of her life she acted as her father's secretary, and attended to all of his correspondence. In a letter to me, written one month before his death, Mark Twain wrote: "I shall not have so dear and sweet a secretary again."

Samuel L. Clemens.

MARK TWAIN IN YOUNG MANHOOD
From one of the illustrations in Mr. Paine's biography (Harper).

Some reviewers have found fault with Mr. Paine's book because it is so voluminous. I only wish it were longer. To select materials from so vast a heap of manuscripts and documents as were placed at his disposal was a task the magnitude and difficulty of which can hardly be estimated; but the work has been done with one single aim—to present the great figure in its many-sided activity, and to keep that picturesque personality constantly before the reader. There are certainly some sensitive critics who will lament the fact that Mr. Paine's style

is not more conspicuously literary, has not more distinction; but the biographer, with a modesty and self-effacement that are truly admirable, has not once attempted to display his own rhetorical gifts, but has ever kept the strong light on his hero. We see Mark Twain exactly as he was, childishly angry at being beaten at billiards, horribly profane and sacrilegious, tender, patient and sweet with little children, treating them with a dignity that completely won their hearts, raging with knightly anger at snobbishness, cruelty, extortion, and affectation, speaking his own mind on the great names in letters, and steadily working at his art. The way to judge of the success of a biography is not to estimate the merits of its literary style, but to consider whether or not it gives a vivid, complete and permanent picture of the subject. This has been the only aim of Mr. Paine, and he has shown the same tact, the same patience, and the same devotion that characterized his constant attitude toward Mark Twain during the years that they lived together. As one reads this book one does not think of the author—one thinks only of the subject. No higher tribute could be paid to its complete success.

The only blot I find is a superficial one, and one that can easily be corrected in subsequent editions. There are frequent typographical errors, and frequent misspellings of proper names. In one instance Carlyle is given as "Carlisle," and there are many other examples of careless proof-reading. The whole work should be microscopically reread by its author to remove these blemishes.

American literature on the whole has been so second-rate, so uninspired, so full of little men and common place works, that we are grateful for so complete and honest a presentation of one of our few world-figures. WILLIAM LYON PHELPS.

Some Scots Stories

The character of the lowland Scots presents many queer anomalies. It has been said that living upon a low plane of happiness they are content to suffer gladly many things which would drive those of other nationalities to suicide. Perhaps the climate has much to do with it; the long continued season of rain, the dull skies and mist-capt hills. Yet who that has lain upon the hillsides of the Dumfriesshire moors and heard the lambs bleat faintly all around on a broiling summer day can ask for better climate? Or perched on the mountain peaks of the island of Arran, with the glorious expanse of the Firth of Clyde like a plain of gleaming silver and blue below? A wet spring day in Ayrshire, with the scent of the rich earth in the nostrils, or a cold winter morn, clear and bright, in the woods of Lanark or along the rocky coasts of the Firth of Forth, and men's hearts rejoice in life. But these are rare days.

Rain overhead, mud under foot for months on end, undo all the beauty of one's impressions and the gloom descends upon us. Our merriment is tinged with sadness. The visiting stranger is hurled to the bottom of a pit of black despair, and flees the country at the earliest opportunity with openly exprest opinion that the reason of so much sordid drunkenness is all too plain.

It cannot be denied that the poorer Scot is a careless, slovenly body. Nowhere else can be seen such squalor as surrounds the ordinary lowland farmhouse. The cheerless interior, the midden heap dominating the farmyard, the slatternly milkmaids (far removed from those wonderful creatures who figure in romance), the unwashed children, horrify and repel. In the smaller towns the artisan class lives in much the same state of discomfort, crowded into a single room. In mining towns a row of cottages is enough to wring tears from any sanitary inspector.

On the other hand, the children, early accustomed to little, are fitted to battle with the world: constant struggling with poverty has taught them to be careful of their pennies. It is a mistake to suppose that the Scot is mean. When he has money he

spends it freely, but he likes to know that he is not wasting it. In the cities he is the most improvident of persons: money is flung away on unnecessary luxuries, and among the lower classes the pawnshop has to be resorted to every morning.

The life led by the Scot of the soil has produced a certain captivating dry humor—"pawky" is the descriptive adjective. It is too often Rabelaisian in character, for indelicacy in word and deed never troubles him.

The middle class Scot is, however, on a level with the corresponding class of any other nation. If anything, he is superior in education; for school training in Scotland has been raised to a high and efficient standard.

It is to a small country village with its contrasts that one must go to study Scottish life and character. It is the home of caste. The stages—farmhand, artisan, shopkeeper, well-to-do farmer, minister and doctor (counted as of the "gentry"), landowner—are divided by lofty barriers. They touch, but do not mingle in a social way.

It is in a small village that Mary and Jane Findlater, two Scots writers, have found their inspiration.* No one need fear to read their works, for the Doric is used sparingly and with discretion. Would that one cou'd say the same of much of the main body of these two novels—*Crossriggs* and *Penny Monypenny*. Were it not for the vividness of their portrayal of character, character which we recognize with the heartiest appreciation as being the real thing, they would make us vow they were "dreich" or tedious. They are too long for the material employed, lacking in concentration and directness. The joint authors have not learnt to select and to prune. There is no distinction between fine phrases, and there are descriptions of notable beauty, and the veriest commonplace. There is a tendency to apologize for digressions. An author should see that there is no need to beg for patience. And there is a personal disposition to pity the characters; and of all irritating empty adjectives we deplore the meaningless—"Poor": *Poor dear; poor Mr. Blank!*

Yet with all faults, no one can deny merit to these works. Simple and sincere, with a gentle humor, and containing a thoro comprehension of Scots character and power to set it before us, they are worth reading. The period is modern; the people are real, and anyone curious as to country life in Scotland today will find a lively picture of things as they are, far removed from the sentimentality of the kailyard school and the grim realism of *The House with the Green Shutters*.

In *Seven Scots Stories* will be found a nearer approach to the last mentioned novel. Had the author practiced compression she would have been more successful. There is a gripping intensity and sense of tragedy in the three shorter ones, "The Tattiebogle," "Deil's Money" and "The Love Bairn," which renders them noteworthy. The colored plates from watercolors by Henry W. Kerr, R. S. A., are excellent.

The Far West and Its Growth

Miss Coman's work† is a narrative of the exploration, colonizing, and economic development of the trans-Mississippi region. It begins with the beginning and carries the story down to post-Rebellion times. The Spanish opening and occupation of the Southwest and the lower Pacific Coast is treated with ample detail, and a wealth of matter is assembled regarding the settlement of the lower Missouri country and the Pacific Northwest. The successive waves of migration following Wyeth's entrance into the Oregon country are recounted, and careful descriptions are given of the settlers' mode of living and their economic activities.

The task has been laborious, for a mass of early records has been drawn

upon to make the tale complete. Here we have fur traders, adventurers, missionaries, friars, gold-seekers and tillers of the soil contending for a mighty empire which ultimately was to reach, under permanent settlement, a high state of development. Now and then the narrative brings into light again some pioneer whose work made a permanent contribution to the building up of the territory, but whose name has been well-nigh forgotten. There was, for instance, Hall J. Kelley, the Boston school teacher, who penetrated to the Oregon country in the early thirties and whose enraptured vision of that region, which he sought to make others see, was so ridiculed in his own day. Yet all that he predicted, and far more, has long since come to pass.

The controverted questions with which the history of the Far West is so thickly sown are ignored as controversy, and the material of the narrative is chosen from conflicting records with an impartial hand. If Marcus Whitman is made to take his famous journey on "mission business" solely, credit is given him for his wishes and endeavors to have the country settled by Americans. A just tribute is paid to Dr. McLoughlin, the chief factor of the Hudson's Bay Company in Oregon, who, in spite of the contemporaneous feeling against him, is shown to have ruined his fortunes thru the prodigal assistance given by him to the Americans. The story of the Mormon development of Utah is, in the main, fairly told, tho the massacre of emigrants at Mountain Meadows escapes mention. The account of the settlement of California is particularly full and fair.

A notably interesting part of the work is that which treats of such of the economic bases of the Civil War as relate to the Western country. The increasing exhaustion of Southern lands and the rapid increase of the slave population forced the slaveholders to look to an extension of slave territory. As Texas, Louisiana and Arkansas shared in the general condition of the Southern States further east, and as the arid and mountainous regions of the Far West offered no inviting field for this extension, the Kansas-Nebraska country naturally came to be the sought-for region of the slaveholders. The Kansas-Nebraska bill, approved May 30, 1854, in effect abrogated the Missouri Compromise and established the principle of squatter sovereignty. Then came the race from North and South to colonize the sections and the inevitable clash of the contending interests.

All this is, of course, a commonplace of history; but the relation of the agitation for a Pacific railroad and for free homesteads to the general question has never been satisfactorily treated. All elements of the population wanted the railroad; in 1860 both the Democratic parties as well as the Republican party carried the demand in their platforms. But between the Southern demand that the road should begin at Charleston, S. C., and the Northern demand that it should begin at Omaha was a difference that could not be bridged. The homestead agitation also became a sectional matter. The prospective breaking up of the Kansas-Nebraska domain into quarter-sections meant free labor and not slave labor. By 1854, therefore, the South was well-nigh a unit against a homestead act. The homestead bill of 1850 failed to pass, and that of 1854 failed in conference. It was in the debate on the latter bill that Senator Johnson of Arkansas declared that the homestead policy was "so tinctured with abolitionism that no Southerner could vote for it." The bill of 1860 was saddled by the Senate with amendments that the House accepted only under protest. Even then, however, Buchanan, at the behest of the slaveholders, vetoed it. Only after the secession of the Southern members was it possible to pass the bill which Lincoln approved May 20, 1862.

Pother About Women

Why so much pother about women? They have been here for some thousands of years and are likely to remain some thousands more, to carry

their share of the world's work and of its perplexities; but at the moment everybody is looking at them as tho they were some monstrous phenomenon. From the pile of books on our desk concerning themselves with the Eternal Feminine, we select a few of the more salient.

Why Women Are So, by Mary Roberts Coolidge, attracts by its witty title, but all the rest of the book is serious in the extreme, leaving us to wonder who named a scientific and argumentative treatise upon the development of woman after so insouciant a fashion?[1] It should have been called "The Descent of Woman." Its thesis is that the women of the nineteenth century were what men expected them to be, the women of the twentieth century will be more—or at least, different. William Hard ventures to prophesy what they will be in *The Women of Tomorrow,*[2] a collection of clever essays with such suggestive captions as: "Learning for Earning," "Learning for Spending," "Love Deferred," "The Wasters," the latter class typified by Marie, "whose job was being nice"; the "Nice Girl," taken by her husband not to share his struggle but his prosperity, never having in all her life any discipline of difficulties overcome, the most to be pitied of all women, because her soul is smothered in petty luxury, for which she does not pay. The Newer Woman will seek her inspiration from "the spirit that made woman love her child, and that shall yet make her love her kind."

Woman in the Making of America is refreshing, as it recalls to us the actual and great services of the women who have helped make America, the activities of American women in the period of colonization, during the Civil War and in our own times.[3] Mr. Bruce asserts that American women have been, and are, courageous, resourceful, able and devoted to their country and its best interests; nor does he minimize the part they are destined to play in the reshaping of her future.

Mrs. Christie, in *The Advance of Woman,* attempts an exhaustive account of the rise of woman from the earliest times down to the present.[4] She even begins her treatise with a chapter on "Mankind's Dumb Progenitors," taking Ward's position that:

> the female is not only the primary and original sex, but continues thruout as the main trunk, the males being added to secure the crossing of ancestral strains. The female not only typifies the race but is the race.

After this we are prepared for a discussion of the "Matriarchate," the rise of the Patriarchate, the origin of which is left somewhat obscure, and a scathing arraignment of man as a "Social Coward." The spirit of the discussion is too polemical to be strictly fair. The Mothers of the World have certainly had something to do with shaping the ideas of men, even their ideas of womanhood, and it is unjust to blame man as sole author of the inferior position of woman. Yet the burning earnestness of the book makes it worth reading.

Miss Tarbell's argument, *The Business of Being a Woman,*[5] takes the conservative side of the suffrage controversy, and a slightly contemptuous tone in speaking of the modern woman as the "Uneasy Woman." Dressing herself and self-discussion, according to Miss Tarbell, are her most conspicuous occupations. "Restless amazons," "uneasy souls," and "imitators of man," these are hard epithets to hurl at those who are conscientiously striving for an equality of opportunity the world has not yet seen! The reiteration that a woman's proper business is in her home is somewhat irritating when we remember that she is not allowed the initiative in securing the home, and that

nearly eight millions of her, driven by necessity, are already at work outside of it. The passages of the book that deal with the importance of domestic life are sensible and not to be controverted; but not all women are so fortunate as to be engaged in that special business, nor are all fitted for it.

Professor Barnes is more courageous. *Woman in Modern Society* is wholesomely radical and sanely conservative in dealing with the complexities of woman's relation to society.[6] A good breezy blast of common sense blows away the objection that a woman cannot do her full duty to her household and take any interest in outside affairs. As a matter of fact, the average woman has many outside interests already, and few of them so important or dignified as her duties as a citizen, altho taking much more time. In speaking of the working girl, Professor Barnes finely says:

> During the period of transition from schools to their own family life, the girls might well give a half dozen years to work in factories and stores, where the conditions should be as good and as well guarded as in our best school buildings—in factories, in a word, where the employers would be willing that their own daughters should work. This is surely a fair standard. Work which is not safe or fit for me to do is not fit for me to hire done. If this principle fails, then democracy is but a dream.

Irish Avowals

George Moore enjoyed going to priests' school no better than did Lafcadio Hearn. When as a boy of nine he ate his first dinner at the Oscott Boarding School Father Martin told him that he must be silent. "As soon as he had turned his back," he now reports, "I asked my neighbor in a loud voice why the priest had told me I wasn't to talk."

George Moore has been talking ever since. His life in England, France and Ireland, with his interest in all the arts, have given him much to talk about. In the first volume of the trilogy *Hail and Farewell*, which is in fact his literary memoir, Mr. Moore told us of his life in London as a man of letters; his visits to Edward Martyn in the Temple; his tour to Bayreuth, and other matters —including his motives for leaving London and taking up residence in Dublin. In *Salve*, the newly publisht second volume,[1] he tells us of that Dublin, and of conversations on life and literature with Mr. Martyn, Æ (George Russell), and his brother, Maurice Moore. This brother, a colonel in the British army, remained Catholic, whereas Moore, the man of letters, is an agnostic who has flirted with Protestantism, after having made pilgrimages in quest of heathen divinities. With Colonel Maurice, Father Tom (an Irish Jesuit), Editor Gill and other members of the Church of Rome, our author conducts a long discussion on the theme literature and dogma, holding the thesis that Catholicism has checked literary production ever since the close of the pseudo-pagan era of Renaissance Popes. He is not at his best in this controversy, the importance of which he unhumorously exaggerates; but there is, of course, a great deal of truth to be uttered, and he utters it with unction and Mooresque cleverness. This is shown to advantage in his banter at the expense of the author of *The Genius of Christianity*, whom he renames Chateaubrioche, affecting to believe that his immortality is securer in the steak he invented than in his literature, and arguing that his very name is "soft, unreal, spongy—spongy as a *brioche*."

George Moore is an impressionist of impressionists—a dilettante of dilettanti—an immoralist of immoralists. Yet his breviary of disillusion (the phrase is not apt, for it implies a period of illusions) is written in a style of uncommon purity and perfection; with a distinction and simplicity worthy of a better book. Perhaps it is because this is the second volume and not the first that we seem to note a falling off in human interest

[6] *Woman in Modern Society*. By Earl Barnes. New York: B. W. Huebsch. $1.25.

[1] *Hail and Farewell: Salve*. By George Moore. New York: D. Appleton & Co. $1.75.

and literary gusto—for Moore tires soon or late of everything undertaken. Yet this author is not least among the authors of confessions; a born exhibitionist. Here he shows off as master in dialog. Since he it is who holds the pen, it goes without saying that he gets the better of the arguments. Even so, it is no pleasing character that reveals itself. Whistler in the Old Grosvenor Gallery observed to him: "Nothing, I suppose, matters to you, except your writing." It is Moore who records the words—not without proper shame. Even that is something. A notable artist—an ignoble soul!
